VOLUME XXVII.—No. 1.

NEW YORK, JANUARY, 1868.

NEW SERIES—No. 252.

[COPYRIGHT SECURED.]

THE ARTIST'S PETS.—FROM A PAINTING BY SIR EDWIN LANDSEER.—Drawn and Engraved for the American Agriculturist.

This successful representation on wood of one of Landseer's famous pictures, will give pleasure to many of our readers. Even those who constitutionally hate dogs, will admire the faithful portrayal of the animals. Few dispute with Landseer the palm, which all England awards to him, as the first living animal painter. We have in the picture the artist's table, with pencils and crayons, stump, and bit of bread for erasers, (which last has attracted that frequent denizen of artists' studios, a mouse,) the silken-haired poodle, and the gigantic mastiff. Aside from the beauty of the picture, and its interest

as exhibiting two of this artist's own dogs—it is instructive, as showing also to what an astonishing degree a natural species of animals may vary under the influence of food and surroundings. In horses we see a great variety in a single species, varying in size from the great draught horses of 1,600 pounds weight to ponies which a man can lift. The varieties of neat cattle extend from the ponderous Short-horns to the little Brittans and Kerrys of one-third their weight. In dogs, however, there are still more wonderful differences. The smooth skinned monster, standing perhaps 34 inches high to the shoulder,

and weighing 150 pounds, and his little companion, so covered with its silky fleece as to completely hide its slender form, and weighing 5 or 6 pounds at most, are fitting examples of the extent to which the physical characters of animals are under the control of man, for it is only among such as are subjected to the influences of civilization that these astonishing variations occur. While a few, like the dog, adapt themselves to changes of climate and food, and become domesticated, others can only be preserved alive by imitating the conditions to which they are accustomed in their native country.

AMERICAN AGRICULTURIST.

NEW-YORK, JANUARY, 1868.

Thoughts of the New Year are hopeful and joyous, as, heeding the lessons of the past, we press forward in the busy present, eager to try what the hidden future has in store. May it be a happy and prosperous one to all our readers, many of whom we greet for the first time. We might dwell on the events of the year that is past with mingled emotions of pleasure and pain, for it has been an eventful one, and joy and sorrow have mingled in the experiences of our readers and of ourselves; profit and loss have filled their respective columns on the ledger, as deluge or drouth have maintained a parallel account on the face of the country. We turn rather to the duties, opportunities, and labors of the present.

The winter gives us long evenings, and many quiet hours for reading and thought. Thinking farmers are students for whom school always keeps; their education is never complete; they are never too old to learn. There is many a man who ridicules book farming, and never reads an agricultural paper, who is thoughtful in his way, and a very good farmer. He is wide awake when facts are discussed which touch his business; if his neighbor raises bigger crops than he can, he finds out how it is done; if he has better seed, he manages to get some; if he hears of an improved implement, he is pretty sure to find out all he can about it. This is like taking a very poor agricultural paper, and only reading one number a year, or trusting to your representative to send you an Agricultural Report.

A good agricultural paper enables a farmer to talk with a score of neighbors at once about their crops and stock, to learn the ways of doing things which successful farmers pursue in all parts of the world, to learn about new implements, new stock, new seeds, etc., much better than in whole evenings spent with a neighbor who has been to the State fair. If other similar journals increase their subscription lists as rapidly as the *Agriculturist* does, and we hope they do, we must think that those smart, successful farmers who are averse to reading, are fast going out of fashion.

Farmers' Clubs and Libraries ought to be encouraged in every way. Where none exist, they should be organized at once, if there are no more than half a dozen farmers who would agree to attend.

Business—Farmers are not "business men" in the estimation of the world. They ought to be. A merchant's business is estimated by the amount of his transactions rather than by his profits. The farmer's cash account may be small, but if all his transactions could be put down in dollars and cents, he would be surprised at the amount of business he is doing every year. The present is the time to plan and lay out the business of the coming season, and of the whole year indeed. Let us never work without plan, remembering that the more thoroughly labor, time, wear and tear of tools, and stock is estimated in dollars and cents, and the more thoroughly a business view is taken of everything, the more certain will be the profits and ultimate success, if we work on business principles.

Hints About Work.

Building.—Timber may be gotten out, frames cut and fitted, for new buildings, and alterations of the interior of houses or other structures may go on as well in winter as at any time, labor being cheaper, and contractors desirous of having work for the men.

Frost and Snow.—Look to the protection of water pipes, the root cellar, or roots wherever stored, against frost. Snow affords excellent defence against hard freezing. Never delay path-making after the snowing is fairly over. In case of a very heavy fall of snow, endangering lat roofs, etc., clear it off immediately, lest, rain falling, the weight be greatly increased, and serious damage occur.

Icy Paths are dangerous to both men and animals. Coal ashes are usually the most convenient article with which to cover icy spots, but they are

dirty about the house. Sand is better, sawdust still more cleanly, and salt seldom advisable.

Horses.—Look frequently to the canks, and never let them go smooth-shod, the strains and sprains occasioned by going over slippery ground being the frequent causes of spavins, splints, and other lamenesses. Horses not exposed to draughts of air, do not need blanketing in the stable, except when they are warm from recent exercise. Unblanketed, they will eat a little more, but have better health.

Cows.—Dry cows coming in in the spring, need just as good feed and care as if in full milk, but the food need not be so fattening. Roots are a very useful addition to their feed, and they should have the liberty of a sunny yard several hours a day.

Milk cows require, of course, food and treatment calculated to stimulate milk production.

Young Cattle.—Spring calves are making their most rapid growth just when cold weather comes on. They should receive very much the treatment of older stock, and not be wintered in the yards and open sheds. They will eat less, and grow faster for warm stabling; besides, their manure will be worth more. Their growth will surprise one accustomed to winter such stock in the old way.

Bees.—Oil-cake will be extensively substituted for corn meal as feed for fattening stock this winter. Variety is desirable in feeding, salt is essential, regular watering indispensable, and the highest degree of comfort most profitable. Great quiet and warm stables, with good ventilation, and frequent and regular feeding, are the circumstances most favorable to rapid healthy fattening.

Sheep.—Stock sheep ought to have the range of good-sized yards, and the shelter of warm sheds, to which they have free access during the day, and in which they are confined at night. Ewes will do much better for a little grain daily, and their lambs will be stronger. Fattening sheep should be pushed forward during this month to be ready for a rise in the market. Feed meal with care that all get their allowance; those that get too much may suffer for it.

Swine.—Give brood sows good plain feed, not too fattening. If they have made their growth, (and old sows are the best breeders,) they do best on really poor fare. They will even winter well on clover hay, with a few nubbins now and then, if they have good warm pens and plenty of litter.

Fowls should receive especial care towards the latter part of the month. With extra feeding, occasional feeds of chopped meat, or scrap-cake, they will soon lay freely, and if one has warm quarters for young chickens, (a hot-bed frame, with the sashes, of course, is excellent, and so is a cold grapey) it may be well to set hens as early as the last of this month. By employing cocks of the large breeds, Cochins, Brahmans, or Dorkings, large broilers may be ready for market by the time asparagus is fit to eat. It is not worth while, in raising chickens for stock or for autumn and winter marketing, to have them hatch before the middle of April.

Manures.—We shall want manure as soon as the spring opens, and no one can have too much, if properly applied. See "Walks and Talks" on this subject, bearing in mind, however, that as we usually feed the various classes of domestic animals, and as they are likely to be fed from one end of the country to the other, horse manure is much more heating than that of neat stock, that the manure of young stock and milch cows is the poorest, that of horses and fattening cattle the next best, that of swine next, and by far richer, and that of poultry the richest of all, not excepting that of man. Beef scraps, fresh bones pounded, desiccated flesh, and similar things, make the manure of hogs and poultry very rich. The dung of birds is superior to all other kinds that are used on the farm, chiefly because their urine is solid, and is mingled with the discharge from the bowels. Its color is usually white. Save every particle of any kind that can be gathered. Make good broad heaps, and work them over, that they shall not heat, and, if possible, work muck in very liberally. Keep manure under cover.

Drainage may be done, should the frost leave the ground, or be found to be not very deep. See article on draining in winter, page 16, of this number.

Fencing Material should be got out, and hauled to the lines where it is to be used, for fences are usually best built when it is very heavy wheeling.

Fire-Wood.—"In peace prepare for war." Though the whole year is before us, trust that no future time will be better to cut fire-wood than the present—that is, the winter. Have cord wood piled to shed water to the east.

Clearing Land.—This is a very good season in which to blast rocks, cut alders and willows, and often those tussocks of coarse grass, called "bogs." Ditches may be dug in swamps, and such work done.

Thaws.—Those of the Northern States where the land is often covered with great masses of snow, are liable to thaws, coming in consequence of heavy and warm rains. See that no damage occurs from a great rush of water over the frozen surface, or from its being dammed up behind drifts, and entering cellar walls; and stand ready to take advantage of even a temporary breaking up.

Ice-Houses.—It rarely happens that ice does not form, during January, sufficiently to pack. Cut as soon as six inches of clear ice can be got. Ice-houses fail to keep ice for one of three reasons: either there is not perfect drainage, in which case the ice goes very rapidly; or there is access of air to the ice through the foundation or under the sills; or the ice was not well packed. There should be a great abundance of straw or chaff on the floor, and the ice on all sides should be packed with sawdust, chaff, or straw, while plenty of straw should be used to cover the surface.

Work in the Horticultural Department.

It is well that out-of-door work sometimes ceases, or at least becomes so little pressing, that we have time to plan and think. While the general aspect of these notes is such as might lead one to suppose that they were reprinted from year to year, there is really no more pains-taking work put into the paper than just here. Certain things, it is true, have to be repeated, and it is not easy to give directions to transplant cabbages in any great variety of language. In making up these notes we are obliged to have several distinct classes of readers in mind: those who cultivate entirely for profit, and those who grow plants for the love of it, and without regard to gain; those who are familiar with the ordinary operations of horticulture and only need to be reminded of the season in which to do them, and those who essay the simplest operation for the first time. Besides the routine directions it will be found that we each month incorporate much that is new under the different divisions, and answer in general terms many letters of inquiry. Horticulturists have always been in advance of farmers in availing themselves of the recorded experience of others, and we now have not only general treatises, but many excellent works upon special subjects, in which the various processes are treated more in detail than they can be by general writers. The past year has brought out works of great value in all departments of horticulture, and no one whose operations are upon any other than a very small scale can afford to be ignorant of the current literature of his favorite branch.

Orchard and Nursery.

Order Trees early; if one lives near a nursery it will sometimes pay him to give an extra price for the privilege of digging his own trees.

Rabbits are troublesome, especially when the snow is on the ground. Among the various preventives blood has been found the most easy of application and as efficacious as any. One sprinkling will last all winter. If blood cannot be obtained readily, rub the trunks of the trees with liver or bloody meat, but this is more troublesome.

Mice work under cover; keep all rubbish away from the trees, and tramp down light snows. When there are not many trees it will pay to clasp the base of the trunks with a girdle of old tin, or sheet iron.

The Tent Caterpillar is one of the most destructive insects in the orchard, and one of the most readily controlled. The eggs may now be seen glued on as a band around the twigs near their ends. Get them off at any expense of time and labor.

Cions.—The sooner these are cut, the better, as experience has shown that a much larger proportion of early cut grafts will live than those taken after they have been exposed to the severity of the winter; this is especially the case when the autumn has been unfavorable to the ripening of the wood. Label correctly, and pack in boxes of fresh sawdust.

Root Grafting may be done; graft at the "collar" and never on tips of roots. Waxed cotton twine is the most convenient tying material.

Map the Orchard.—We often advise this, and cannot do so too frequently; the best label will get lost or become obliterated in time, and memory is not to be trusted. If a place is to be sold, a named orchard will add much to its value.

Nursery Stock may be headed back and shaped any time during winter when the weather is mild.

Fruit Garden.

Whoever contents himself with a single variety of strawberry, currant, or other fruit, gets only half the satisfaction his garden is capable of affording, or, if he cultivates for market, only a portion of the profit he might otherwise receive.

With proper forethought in selecting early and late varieties to supplement the main crops at both ends, the season of most fruits may be much extended. Now is the time to think up such matters, and to arrange for a succession of fresh fruit, from the time the earliest strawberry ripens, until the last winter pear and long-keeping grape is gone.

At the South, preparing the soil and even planting may go on, but in our colder climate but little can be done save preventing injury to trees by animals and horsemen, and in mild spells to

prune such grape vines and currant bushes as have been neglected until now.

General Work, such as protecting trees, removing the eggs of insects, is hinted at under Orchard.

Kitchen Garden.

The amount of out-of-door work will be governed by the season and the locality; wherever anything can be done to facilitate next spring's operations it should be attended to while work is not pressing. At least the one important article of

Manure—the key to success—can be accumulated. There are but few crops that will not pay for liberal manuring, and where early hot-beds are to be started, the manure may be placed where it will be needed. The heaps should be so large that they will not become chilled through, and if fermentation goes on too actively they must be turned over.

Hot-bed Sashes and Frames are to be in readiness. The usual size of sashes is 6x3 feet. In small operations a frame of convenient size is placed on a thick bed of fermenting manure, but it is quite as well to excavate 2½ feet deep, and board it up with rough boards and place the heating material in this.

Straw Mats will be needed, and a good stock of them may be made in a short time, according to the directions given on page 22.

Cold Frames generally need more attention to keep them cold than to prevent injury from freezing. Cabbages, especially, should have air, except in very severe weather, and in a mild time the sashes may be entirely removed during the day.

Tools are to be overhauled and repaired, and those needed made or purchased. A home-made roller, marker, reel for a garden-line and the like, are great helps, even in a small garden.

At the South, in favorable localities, hot-beds may be started, and Lettuce, Radishes and Cabbages sown in them, and the half hardy vegetables, such as Beets, Carrots, Turnips, etc., sown in the open ground, and the early sorts of Potatoes planted.

Flower Garden and Lawn.

Evergreens are now appreciated, and the present is the season to discover where they may be introduced into the grounds to the best advantage.

Rhododendrons, Hollies, and other of the broad-leaved evergreens may be made to contribute largely to the cheerful winter aspect of the grounds, and some of them, such as the Kalmias and Rhododendrons, serve the double purpose of making them gay with their flowers in spring and summer.

Shrubs and Trees of all kinds must not be broken or bent out of shape by heavy loads of snow.

Hedges may have their winter pruning in mild weather and in southern localities.

Bor Edgings may be laid, using rooted plants only.

Green and Hot-Houses.

An average temperature of 50° in the green-house, with a rise and fall of some 15° for the extremes of mid-day and night, will do for general collections.

Camellias and Azaleas now in bloom need liberal watering; those done flowering prune into shape.

Hyacinths and other bulbs may be brought into a warm place to keep up a bloom, and as soon as the flower fades, cut away the stalk.

Propagation of Verbenas, Heliotropes and other summer bedding stuff, may be carried on.

Seeds of Pansies, Stocks, Petunias, etc., are to be sown to furnish plants for spring flowering.

Oranges and Lemons are to be kept in a cool part of the house and only sparingly watered.

Frozen Plants in dwellings are often killed by kindness. Thaw them always in a cool room.

Insects need to be kept under from the start. Tobacco smoke, and the use of the thumb and finger, are generally sufficient remedies in small collections.

Apiary in Jan.—Prepared by M. Quinby.

There are some people who are totally indifferent to the comfort of stock of all kinds; others who give every care to provide comfortable shelter for their cattle, but nevertheless leave their bees exposed all winter. We judge this comes from ignorance of what to do rather than from willful neglect. If bees are allowed to remain on their summer stands, shelter from prevailing winds. Where few bees are kept, when swarms are hived, they should be placed in the lee of the buildings, or tight fences, or of an evergreen hedge. If in a Southern exposure, keep the sun off their hives, that the bees may not be too much excited by its deceptive warmth.

It is better they should only fly when the temperature in the shade tempts them out. In the common box hive, a three-quarter inch hole, one third of the height of the hive, from the top in front, if the combs run from front to rear, if not, at the side, is an advantage. If the entrance at the bottom is stopped by dead bees or snow, they have the upper hole free. They use this, and give themselves no concern about cleaning house in cold days, but fly in and out at this upper entrance. They enter at once in the cluster, for you can always see them clustered close to this entrance, and below it, except in extreme cold. This is preferable to having to crawl up a long cold side, and saves many lives. Covering hives with straw answers well. Further south, where the winters are open, and bees can fly occasionally this month and next, it may be as well to leave them out, but a decided advantage is found further north, by wintering in a dry cellar, or a properly constructed pit. A uniform and dry atmosphere, a few degrees above freezing, is the end desired for safety, and for economy of stores.

Although bees lose less in numbers when wintered in a cellar, they begin to breed earlier when left out, which makes the latter course preferable for latitudes not subject to extreme and long continued cold. As this paper is read from Canada to Florida, we can best serve the interests of its readers by advising them to experiment cautiously, and find out what is best for their locality, not incurring risk by putting all their eggs into one basket.

Office, or \$1.75 if sent by mail, as they may prefer.

volume.—They are profusely illustrated, the Engravings used in them having alone cost above Twenty Thousand Dollars! Those obtaining premiums for from one to ten volumes, can select any volumes desired, from XVI to XXVI, inclusive. For ordinary use, the sets of numbers unbound will answer quite well.—Many hundreds of these volumes are taken every year as premiums.—In Nos. 61 to 71 we offer the *bound* volumes also.

Nos. 74 to 85—GOOD LIBRARIES.

In these premiums, we offer a choice of **Books** for the **Farm, Garden, and Household**. The person entitled to any one of the premiums 74 to 85, may select any books desired from the list below, to the amount of the premium. The nearest Post-Office, or Express office, as we may find it most convenient to send them. We need not enlarge upon these premiums; every one knows the value of good books. Twenty-five or Fifty dollars' worth of books on subjects pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to *make their heads help their hands*. Any good book will, in the end, be of far more value to a youth than to have an extra acre of land, on coming to manhood. The thinking, reasoning, observing man, will certainly make more of an acre, than he would off from 50 acres without the mental ability which reading will give him.—Our premiums will enable many a family to secure a larger or smaller Library. **25** This is a good opportunity for the Farmers of a neighborhood to unite their efforts and get an Agricultural Library for general use, as others have done.

No. 86—General Book Premium.

Any one not desiring the specific Book premiums, 74 to 85, on sending any number of names above 25, may select Books from the list below, to the amount of 10 cents for each subscriber sent at \$1; or to the amount of 50 cents for each name sent at the (ten) club price of \$1.20 each; or to the amount of 60 cents for each name at \$1.50. *This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid by us.*

BOOKS FOR FARMERS AND OTHERS.

[For sale at the office of the *Agriculturist*, or they will be forwarded by mail, post-paid, on receipt of price. **25** All these are included in our Premiums, Nos. 74 to 86, above.]

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending Dec. 16, 1867, and also for the preceding month:

1. TRANSACTIONS AT THE NEW-YORK MARKETS.
RECEIPTS. Flour, Wheat, Corn, Rye, Oats, Barley, Oats.
23 days this month 1,500,000 1,500,000 54,000 51,000 1,135,000
23 days last month 1,500,000 1,500,000 54,000 51,000 1,135,000

SALES. Flour, Wheat, Corn, Rye, Oats, Barley.
23 days this month 1,500,000 1,500,000 54,000 51,000 1,135,000
23 days last month 1,500,000 1,500,000 54,000 51,000 1,135,000

2. Comparison with same period at this time last year.
RECEIPTS. Flour, Wheat, Corn, Rye, Oats, Barley, Oats.
23 days 1867.....1,500,000 1,500,000 54,000 51,000 1,135,000
23 days 1866.....1,500,000 1,500,000 54,000 51,000 1,135,000

SALES. Flour, Wheat, Corn, Rye, Oats, Barley.
23 days 1867.....1,500,000 1,500,000 54,000 51,000 1,135,000
23 days 1866.....1,500,000 1,500,000 54,000 51,000 1,135,000

3. Exports from New York, Jan. 1 to Dec. 1:

Flour, Wheat, Corn, Rye, Oats, Barley.
1867.....1,500,000 1,500,000 54,000 51,000 1,135,000
1866.....1,500,000 1,500,000 54,000 51,000 1,135,000

4. Stock of grain in store at New York:

Dec. 11, 1867.....1,500,000 1,500,000 54,000 51,000 1,135,000
Dec. 11, 1866.....1,500,000 1,500,000 54,000 51,000 1,135,000

Sept. 10, 1867.....1,500,000 1,500,000 54,000 51,000 1,135,000
Sept. 10, 1866.....1,500,000 1,500,000 54,000 51,000 1,135,000

July 15, 1867.....1,500,000 1,500,000 54,000 51,000 1,135,000
July 15, 1866.....1,500,000 1,500,000 54,000 51,000 1,135,000

May 15, 1867.....1,500,000 1,500,000 54,000 51,000 1,135,000
May 15, 1866.....1,500,000 1,500,000 54,000 51,000 1,135,000

5. Receipts of Breadstuffs at the water at Albany, May 1st to November 30th:

Flour, Wheat, Corn, Rye, Oats, Barley, Oats.
1867.....1,500,000 1,500,000 54,000 51,000 1,135,000
1866.....1,500,000 1,500,000 54,000 51,000 1,135,000

Gold has been as low as 133, since our last. It closed on Saturday, Dec. 14th, at 132½. Breadstuffs have been in moderate demand, during the month. The sudden closing of the State canals, and the detention therein of unusually heavy amounts of produce, have materially restricted our winter supplies, giving holders of available lots the advantage as regards price, in the local market. But the light offerings and the advanced rates claimed, have checked the home and export trade in both flour and grain. Export orders generally run below the earlier figures here, and can be executed with difficulty. Toward the close, holders were firm in their views, and buyers were more disposed to operate. Cotton has been quite freely offered and purchased, since our last, at reduced quotations, closing however, with more steadiness. Wool has attracted more attention from manufacturers, as well as from the trade, and do-ible lots of domestics have been held with more confidence. Hay has been less plenty and more sought after at an advance. Provisions have been in light demand, generally at irregular rates. Seeds and Tobacco have been quite dull at about previous prices.

CURRENT WHOLESALE PRICES.

	Nov. 18.	Dec. 16.
PRICE OF OATS TO EXPORT	139½	133½
Flour—Super to Extra	9 3/4	9 3/4
Super to Extra Southern	9 3/4	9 3/4

any wonder, then, that there are so many complaints of losses by mail? And is it not evident that in 99 cases in 100 the fault is with the *writers*? Yet some people complain if publishers and others do not assume all losses of money said to have been properly mailed to them. Nobody is willing to believe that he could have made any mistake, yet somebody must make these millions of mistakes, and the responsibility for them is pretty well distributed among all classes. We have heard parties assert that on such and such days they positively mailed as subscription money "all right," when we had in possession the very letters referred to, and they had no signature or other marks to show where they came from. We think our correspondents must be unusually accurate, however, for of the more than 100,000 letters annually sent to us, there cannot be anywhere near 1,333 defective ones; yet there are some, and the lesson to be learned from the above notes, by every one, is: Be very careful, 1st, to direct every letter fully and *plainly*: 2nd, to *sign* it; 3d, to give it the proper date, with, 4th, your own Post-Office, County, and State, and, 5th, seal it strongly after everything to be enclosed is surely put in! Write matters relating to business, and to the editors, on *separate* pieces of paper, with name, date, and place on *each* paper. . . . Just as we close this, a well written letter comes in from Ohio, part of it to one person, and part to us in a postscript to the other letter. It has money enclosed, about which nothing is said; and *there is no signature to show from whom it comes*. What shall we do with it—and with others like it?

The American Horticultural Annual for 1868.—This record of the year just passed is now ready, and will be found full of useful references in all departments of horticulture. Besides being a compendium of the new fruits, flowers, vegetables, etc., published during the year, it contains original articles of permanent value, by well known writers on horticultural subjects. The editor has had the collaboration of the Hon. M. P. Wilder, Dr. J. A. Warder, Peter Henderson, Saml. B. Parsons, J. J. H. Gregory, Josiah Hoopes, Geo. W. Campbell, James Vick, P. R. Elliott, A. S. Fuller, Thomas Meahan, and others. An Almanac, a carefully prepared Calendar for each month, several handy tables, lists of publications and of nurseries, are to be found in its varied contents. The illustrations are of great beauty, and are all prepared expressly for the work, which we trust will prove as acceptable and popular a hand-book as its predecessor.

Humbugs.—Happy for own comfort and convenience, we are, this month, relieved from the necessity of making a long list of exposures of Humbugs, though, we fear, the respite will be a short one, and that we shall have to continue to sweep at the Augean stables. The subject cannot be dropped until the vile race of swindlers is exterminated or starved out by the thorough diffusion of knowledge of their operations and subterfuges. We have the usual supply of letters concerning the operations of the swindling gentry, but they happen to be similar to the operations we have recently exposed. And, then, a special letter to our labors just now is found in the help from Congress and the Tribune, both having come to our aid. Hon. Mr. Van Wyck offered and secured the passage of a resolution in Congress, demanding of the Commissioner of Internal Revenue, why he exempted from the special lottery tax the scheme known as the "*Geddyburg Angel* for Invalid Soldiers." Mr. Van Wyck stated that the firm, offered as a \$90,000 prize, was in his district, and was not worth \$90,000. He said, he understood that the diamonds offered were worthless stones, and he blamed the P. M. General for having requested all postmasters to aid the enterprise. The Tribune, which has, in times past, published so many advertisements of various parties, whom we have denounced, has recently given the Humbugs some hard knocks. With these efficient helpers in the work, we are quite glad to take a month's respite. We simply add here, beware of certain new newspaper enterprises just now. There are quite a number of these started, under various names, and with great pretensions and "enormous circulation," but really to further swindling enterprises. Some pretend to send by mail \$100 bills in copies of the paper, which is both unlawful and improbable; some, like the "World of Plenty," show their character on their face.

An Excellent Ointment for chapped lips and hands, for dry sores, for burns, for sore nose, for softening corns on the feet, for piles, in short for any diseased surface where a soft protecting coating is required, is what is called "*Glycerine Ointment*." This can be readily prepared by any druggist, by simply rubbing into what is termed "cold cream" a little glycerine—just enough to give it a soft, lard-like consistency. More glycerine can be added in winter than in summer. A drop or two of oil of roses stirred in, gives it an agreeable perfume. It should be kept well corked, and be made fresh

every month or two. When the hands become chapped or roughened by cold weather, smear them with a little of the glycerine ointment at night, rubbing it in, and then wipe off all that will soil the clothing, and the skin will usually be soft and pliable in the morning.

"Baggage Smashers."—To R. R. Managers.—A species of downright robbery is now practiced upon travelers on very many of the public conveniences in this country. We assert as a fact from our own observation, that many men employed to handle baggage take a special delight in seeing how hard they can pitch a trunk about. We have seen them use extra exertions to give a large trunk a hard thump, and to see how far they could throw a lighter one—as if trying to earn the name of a "baggage-smasher," instead of that of careful baggage-men. Let any of our R. R. Managers stand where they will not themselves beseech, and note the handling of the baggage at a station. They will usually see the trunks thrown out, or in, without the least care to save them—the corner of one pitched with force into the side of another—in short, no care is used to spare them in any way, but everything done to injure them that can be done. Probably forty thousand travelers' trunks are daily handled upon our railroads, in the aggregate, and the unnecessary hard usage they receive amounts to 25 cents each, or \$10,000 a day! Judging from our own past experience, if setting out upon a journey, in this country, we would willingly give 25 cents a day in advance, to have our trunks handled with the same care that is exercised on the European railroads. Here, 100 days' traveling and stopping will thoroughly use up \$25 trunks, no matter how strongly made. After a six months' tour in Europe, including 12,000 miles by railroad, with our baggage taken off and carried to sixty different hotels, and returned to the cars, the trunks came back in a condition suitable for another trip of equal length. . . . In but few of the railroads was any charge made for carrying the baggage. A traveling companion, who also brought his trunk in perfect condition to New York, had it jammed, broken, and the contents injured badly, in going barely 150 miles from the city. Will not our R. R. Managers do a great favor to the public, by looking into this matter—giving a word of caution to the careless or mischievous, and dismissing the incorrigible baggage-smashers?

Water-proof Leather Preservative.—R. J. Smith, of Ulster Co., recommends the following, which is said to have been in use among New England fishermen for 100 years, when it was published in an almanac for 1794. "Take one pint boiled lard oil, half a pound mutton suet, six ounces clear bees-wax, and four ounces rosin; melt and mix over a fire, and apply while warm, but not hot enough to burn the leather. Lay it on plentifully with a brush, and warm it in."

The Illustrated Annual Register of Rural Affairs for 1868.—This little annual, by John J. Thomas, is published by Luther Tucker & Son, Albany, N. Y., and contains the usual amount of interesting matter. The leading articles are upon the Rotation of Crops, Small Fruit Culture upon the Hudson, Shrubs and Shrubberies, etc. This is the fourteenth annual volume, and the whole set, neatly bound, forms a valuable addition to any agricultural library, whether public or private. Price by mail, 30 cents.

The Practical Entomologist.—This periodical, which was too good for the price, stopped at the close of its second volume. The American Entomological Society, by whom it was published, lost money in the attempt to disseminate a popular knowledge of insects, but they doubtless did much good in the publication of even two volumes. These are full of interesting and practical matter, relating to insects, written in an attractive and popular style. The two volumes have been bound in one, and are sold (by mail) at \$2.25. They may be had of E. T. Cresson, 518 South 13th Street, Philadelphia, or by sending to the office of the *Agriculturist*.

Dwarf Pear Trees.—"New Subscriber." Mansfield, O. If we infer rightly, from your letter, your question is with reference to fruit for market. If so, we should plant trees on pear roots, by all means.—Answers to the remaining questions require too much space for a basket item; will try to reply to them in a general article on the subject.

Criticism.—"Subscriber." We cannot undertake to keep other journals from publishing nonsense. It is only when their teachings are positively injurious that it is worth while to criticize. We must therefore decline your article.

Rose Leaves.—"Virginia Lady." We cannot tell what causes the trouble—whether insects or

fungus—from the description. Please send fresh leaves by mail, next spring.

Ferns and other Wild Plants.—"L. C. F. W." South Orange, N. J. Gray's Manual of Botany gives descriptions of all the wild plants east of the Mississippi and north of Virginia. Illustrations are given of the genera of the ferns. The queries relating to exotic ferns we will bear in mind.

Huckleberry Tomato.—Last year a friend in California sent us some seeds under this name, stating that the fruit was used there to make pies, which resembled those made of huckleberries. This year the seed appears in the catalogues. Mr. A. F. Knoblock writes from Louisiana that he has bought the seeds, and that the plants are the same as the Wild Nightshade, which the creoles call *Joyelle*. The same was tried at the Royal Horticultural Society's gardens, at Chiswick (Eng.) and is stated in the last *Floralist and Poinsettist* to be "one of the forms of the little, black fruited *Solanum nigrum*." This plant has a rather bad reputation, and we should rather not have our pies made from its fruit, though cooking may destroy any poisonous properties.

Medusas and Rotifers.—"J. M. S." Jackson Hall, Pa. Medusas are jelly fishes that live in salt water. Rotifers are microscopic crustaceans. Tenny's Natural History will give a good general idea of these, and other less known forms of animal life.

Fruit in Nebraska.—A correspondent writes: "There is beginning to be much interest in the subject of fruit growing all over the State. An agent for a single nursery East, told me that he had, within two months time, obtained orders for \$10,000 worth of fruit trees. Hardy grapes can be cultivated with success."

Fine Premiums for Grapes.—The Longworth Wine House offer a silver pitcher, waiter, and goblets of the value of \$350, as a first premium, and second and third premiums of the value of \$100 and \$50. "The first premium to be given to the best general wine grape of our whole country. The second premium to be given to the best variety of grapes for wine purposes in the State of Ohio, provided it is not awarded to the grape that receives the first premium, in which case it will be given to the second best wine grape in the country. The third premium is to be given to the best table grape, for general purposes, in the country. Our requirements are that the plants, when generally cultivated, shall be perfectly healthy, hardy, and productive, and the fruit shall produce a wine of good quality as to flavor, strength, and quantity. The fruit shall be shown at the coming Fall Consolidated Exhibition of the American Vine Growers' Association of Ohio, and Cincinnati Horticultural Society, in quantities of ten pounds or more, with samples of the wines from the competitors for the first two premiums, if practicable." The exhibition will take place at Cincinnati, on September 23d, 1868. The silver ware has already been made, expressly for this award, and is beautiful in design and workmanship.

Are Plants Detrimental to the Health?—Some time ago, the Journal of Botany (English) published the statement that four assistants in the Kew Herbarium resigned on account of ill health, three of whom died, etc. This was copied in various papers, with such additions and improvements that made it apply to the Kew Gardens, and to plant culture generally. The article in its latest form is quite a bugbear, and has been sent us by a correspondent, who is evidently concerned at the statement that "In all gardens the health of practical cultivators is exposed to a certain degree of risk." So is the health of everybody everywhere. It may satisfy our friend "J." to know that the story has just this foundation. Of the assistants in the *Kew Herbarium*, not gardens, "Two, unfortunately, succumbed to constitutional ailments; of these one, at least, was seriously ill before he entered upon his duties; the other died in India; while a third was 'tomshawked' in Australia."

A String of Queries.—"J. H. P." Geauga County, Ohio. Your letter is interesting, but another time have the kindness not to put such widely different subjects on one sheet. 1. One hundred and twenty-two and a half pounds of squashes to one vine is large, but it has been much exceeded. 2. The value of stable manure can be increased by composting with muck and leaves—do not use lime. 3. It is best to plow in the garden manure. 4. Fall setting, except in severe climates, is best for blackberries and raspberries, and then they should be cut back to a few inches. 5. The lecturer who told you that small fruits did best on poor soil, didn't know much about it. 6. Study any standard work on

grape culture. 7. The renewal system in strawberry culture has its advocates, and in localities where labor is scarce, may pay better than cultivation in separate hills.

A California Grape Book.—"Grape Culture; or Why, Where, When, and How to Plant and Cultivate a Vineyard, Manufacture Wines, etc. Especially adapted to the State of California, and to the United States Generally." By T. Hart Hlyatt, San Francisco. H. H. Bancroft & Company. A work of 264 pages, which discusses Grape Culture mainly as followed in California, but which will hardly be of much use elsewhere. It contains many useful statistics and descriptions of the varieties cultivated on the Pacific Coast, and will, no doubt, be found useful in that remarkable grape region.

Grape Cuttings.—"Novice." If you have only 10 or 12 single eyes, and the kind is rare, you had better get some experienced propagator to start them for you. If as a "Novice" you wish to amuse yourself, you can try your eyes in a pot, in a hot-bed, the last of February or early in March. Propagators differ as to the amount of wood left on the cutting, and the form of it. We cannot give the space now to describe them. A half an inch of wood above and below the bud will probably answer your purpose as well as any.

Essays on Localities.—A surprising number of very long, and often well-written, articles come to us, particularly from the Southern States, praising a particular township, in a particular State, as the earthly paradise to which all people are invited to emigrate. Some of these articles are evidently written with an eye to land speculation, while others are of a disinterested character. Did we publish all the articles of this kind we should have little room for anything else. While such information is of use to us in various ways, our friends who write very long articles must not be disappointed at not seeing them in print.

Fruits from Iowa.—"N. B." The specimens you send are the well known Ground Cherry, or Strawberry Tomato (*Physalis viscosa*). We have commended it for many years as an agreeable fruit.

A Bad Weed.—Hugh Miller, Mich. The specimen is *Xanthoxylum spinosum*, the Thorny Clover. It is an ugly creature, and we shall publish its portrait. We never knew it so far away from the sea-coast before.

What's in a Name?—At the meeting of the American Pomological Society, the Benrie Diet was discussed; a St. Louis paper reports it as the "Beau Ideal."

Fine Cranberries.—Mr. Orrin Cook has sent us very fine specimens from his cranberry meadow. We do not know but they might be excelled in size and beauty, but we never saw finer cranberries.

Bene.—C. H. C., Shelby, Mo. This is cultivated for its leaves only. One or two of them, placed in a tumbler of water, will in a short time form a thick mucilage, which is used in affections of the bowels, in place of gum arabic water and other drinks of the kind.

Rabbits in the Orchard.—C. L. Jessop, Baltimore Co., Md. The use of blood to prevent rabbits gnawing trees, is a Western practice, and there it is found that one application answers for the winter. It is scattered upon the trees by means of a swab; one may be readily made of corn-husks, and tied to a stick.

Shutters for Hot-beds and Frames.—In England, they make a light shutter, by tacking a straw mat to a frame, cover the mat with gas-tar, and then sprinkle on all the sawdust the tar will hold. Said to be very durable, and excellent as a protection against frost.

Kittatiny Blackberry.—J. S. Conklin, Ohio. The discussions at the meeting of the American Pomological Society showed that this variety maintained its reputation for productiveness and hardiness all over the country. Superior in flavor to all others.

Beautiful Begonias.—For richness of foliage few plants exceed the Begonias. Some of the most beautiful of these we have ever seen are in a recent importation by Olm Bros., of Springfield, Mass.

Work from Measure.—Much bungling in mechanical work of all kinds would be avoided if amateur mechanics would only first make an accurate working drawing. If one is to lay out a garden, whether for use or ornament, it is best to make a plan, drawn to a scale. It will save a great deal of time when the work is in progress, as there need be no stopping for consultation.

All the head-work can be done these winter evenings, and when changes are to be made, they are much easier done on paper than on the ground. A large sheet of stiff, smooth, brown paper will answer; draw the plan first with pencil, and when satisfactory, go over the lines with ink, and put down the measurements in plain figures.

Bad Luck with Poultry.—W. P. Page, of Knights Ferry, Colorado, is sadly in need of information about poultry ailments. We would be glad to publish any information which is to the point. He writes: "The past year I hatched over 800 turkeys, and shall raise twenty. Most of them lived till they were about four weeks old, and some a longer period, when they would refuse to eat, and die in a day or so. Their first food was corn meal, and as soon as they would eat it, wheat, which is the universal feed for poultry in Colorado. I had twenty-one hens and fifteen gobblers, which I neglected to dispose of in season, and kept over. Besides, a disease has broken out among my grown chickens and old hens. The tongue, roof of the mouth, and windpipe, became coated with a yellow, offensive substance. It eats into the tongue, fills up the windpipe, and causes suffocation. I lost one to-day, and found the windpipe was coated down three inches. Others are constantly gaping, the mouth is frothy, and they will live a week or more. I can discover nothing the matter with them otherwise; no running at the nostrils, or froth in the eye. A few have their eyes swelled; it commences in one eye, and if they do not recover, spreads into both. I am located on a dry, sandy hill, with a free range of the whole country around. It is very hot in the summer, and I have no shade trees near. The water I have to bring and place in shallow vessels, which arrangement I do not like. I think water in a larger body would be better. In the winter and spring, a mining ditch of clear water runs near the house."

"Six-Leaved Clover."—"S. H. B." We never noticed a plant in which all the leaves were divided into more than three parts. Yours with six leaves, all through, is a curious sport.

Eradicating Ivy.—W. D. Arnold has a large quantity of Poison Ivy on land he wishes to plow; the vine poisons him badly, and he is afraid to grub it up. He asks if it cannot be killed by applying salt. Salt enough to kill the Ivy would keep the land useless for a long time. The poison affects but a very small proportion of people, and it would not be difficult to find workmen who are insensible to its action to grab the thing up.

Kyanizing.—Andrew Bean, Cortlandt Co., N. Y. Kyanizing is, strictly, the use of a solution of cuprous sublimate for the preservation of wood; this was the original process of Kyan, the inventor, but the name has since been used in speaking of the employment of other preparations. A solution of blue vitriol (sulphate of copper), one pound to three gallons of water, will answer for your hop-poles, but why not use coal (or gas), tar, which is cheap, easily applied, and effective?

Butter-working Churns.—George D. Fort, Burlington, (Vt.) We have seen several butter-working churns. Some are very good, like the "Julien," but none work the butter thoroughly enough. They are convenient to get out most of the buttermilk, but after this, the butter should be removed, and worked over.

Clotted or Bloody Milk.—Chester Palmer, of Lake Co., reports his practice as follows: "Take a potato or two, and with a penknife bore out a hole in each, large enough to insert a piece of the root of bloodroot, which do, and feed to the cow. You will see a change for the better in 12 hours."

Dog Law in Tennessee.—They propose in this State to exempt one dog to each family—enough, certainly, to make sheep-scare. We are curious to know how many pups constitute an outfit for an average Tennessee family. Will some of our exchanges tell us?

Hog Cholera—Tar as a Cure.—Tar has frequently been recommended as a cure for hog cholera, which name is probably given to two or more distinct diseases. Our correspondent, P. L. Walker, of Caswell Co., N. C., has such success, that we give his communication: "As soon as I find the hog is sick, I have it caught and thrown upon its back; and take a ball of tar, a little larger than a bicorne nut, on the end of a small stick, and put it down the hog's throat, and hold the hog until the tar is swallowed. I then cut off his tail or cut the ear, although I don't know that the bleeding is an advantage, but think the tar is what effects the cure. I cured a good many very bad cases in this manner. Tar has been given by rubbing it on the corn, but in that way I don't think the hogs swallow enough of it."

Tainted Meat Barrels.—Several persons have sent us their methods of cleansing meat barrels, from which we select the following. E. J. Cole, Iowa, washes the barrel first, and crushes a lot of brimstone two inches long, and puts it on a small fire, over which he inverts the barrel. Then bricks are placed under the edge of the barrel, to give the necessary draft. The barrel is allowed to remain in this position until the brimstone is consumed. Another, at Correy, Pa., says: "Fill the barrel with good hay, heads of grass is best; pour on boiling water, cover tight, and let stand until cool. Repeat the operation if necessary." "G. S. S." Lincoln, Del., recommends soaking them in boiling hot water and ashes. The vessels thus treated in scalding hogs are made sweet.

Moths in Furs.—L. F. Whitaker. The eggs are hatched the same season they are laid, and there is no probability that any are now in the furs; the larva, or that form of the insect which does the mischief, may be seen if there. A careful baking, or shutting the furs in a tight box, first sprinkling with pure benzine, will kill it.

Street Sweepings are an excellent fertilizer, and ought to be a source of income to all city corporations. In Paris, they are sold for \$600,000, annually, in gold. In New York, they tax the people a larger sum to get rid of them. Tax payers ought to study the cause.

Honey.—Mr. G. Steiner, of Atchison Co., Mo., hived two swarms in one hive, on July 3d and 4th. The yield of the hive was 130 pounds of fine honey.

Salt around Gate Posts.—J. B. Hill, Vt. You ask if it will pay to use salt around fence posts to keep them from being heaved in clayey land. It will pay, we think, to sprinkle a handful or two every season around gate posts, and where it is of especial importance that posts should not be heaved. Refuse brine would do as well. It works so long as it remains in the soil near the surface around the posts, by preventing its freezing, or so weakening the ice in the soil that it cannot lift the post. It may be applied any time before the frost comes out of the ground.

American Sheep Shears.—We have hitherto been too much dependent upon England for our best cutting, and sheep shears were no exception. Hardly willing to trust, without the test of use, our own favorable impressions in regard to the excellence of these sheep shears, made by Henry Seymour & Co., of this city, we have submitted them to the judgment of practical sheep shearers, who are much pleased with them, and to experts in steel manufactures, who pronounce an unqualified approval, confirming us in our own opinions.

Rose, "Gem of the Prairies."—Mr. A. Burgess of Glen Cove, N. Y., a few years ago raised a seedling which is a cross between the well known Queen of the Prairies and the Hybrid perpetual, Madame Laffay. It is a beautiful climber and very fragrant. Mr. Peter Henderson paid \$300 for the stock of it—about 20 plants—a fact which shows that native seedlings are appreciated in commerce, provided they have merit as well as novelty.

Milking Machines.—D. N. Barnes, of Kansas, seeing cow milkers advertised in some agricultural papers, writes to inquire about their value. We find it very difficult to learn much about them. Those who sell them keep very shy of the *American Agriculturist*,—so do dealers in lumbags generally. We are willing and desirous of giving any such thing a fair investigation and trial, if possible, and have tried, and failed, even to witness a trial of the cow-milker.

How to Renovate Velvet.—Henrietta Clark, McLean, Ill., writes: "Have a flat-iron hot enough for ordinary ironing, with any convenience that will support it with its face upward, (small pieces of boards nailed together like the sides of a box, or a thick rug in your lap.) fold a towel until it is just large enough to cover the face of the iron, wring it very dry from water, as hot as you can bear, and place it on the iron; then the velvet, with its right side upward. Now with a soft brush, or a piece of soft woolen goods, brush it lightly, all the time one way, until the cranes are removed; then spread it on a flat surface to remain until it is perfectly dry."

Potato Queries.—J. H. and others. The Early Goodrich is no doubt the best and most productive variety, generally obtainable of dealers. Sebec is smaller, rounder, not quite so early; esteemed in New England. Harrison is a good winter potato, not of quite so fine a quality as the Peach-blow and Mercer, but more healthy and productive. As to where they may be had, we cannot refer you to one seedsman rather than another. Any first-class establishment can supply them. See our advertising columns for potatoes and seeds of all kinds.

The Commission of Agriculture.

—The President has nominated, and the Senate confirmed, Col. Horace Capron as head of the Department of Agriculture. The gentleman has assumed a position in which he has an opportunity to do much good or to be considerably worse than useless. We shall watch his doings with much interest, and shall be as ready to commend any good work as we have in the past been to censure official incompetency. We hope for the best.

Sowing Grass Seed on Old Meadows.

—W. D. Arnold, Saxtonville. The grass seed would catch if the meadow were scarified with a harrow, and the seed bushed in. Sow four quarts of Timothy and four pounds of clover seed to the acre, the last of March.

Farmers' Fruit Clubs.

—Some good friend sends us the proceedings of the Alton, Ill., Horticultural Society, cut from the local paper, and we wish he would send one to every reader of the *Agriculturist*, just to show what may be done in every town throughout the country. Do you wish to know what apples to plant? Ask Smith to come and take tea with you next Thursday, and Smith and bring Jones as he comes along, on condition that each shall bring a specimen of every apple has in eating condition. Overhaul your own apples, and if there is any particularly nice variety in the neighborhood, or on sale in town, get a sample. After tea, talk (and eat) apples. Probably twenty sorts will be sent together, and the talk will be worth five to fifty dollars to each one present. There will be a Pomological Society before you know it; of course next month all will meet at Jones', and each will ask in one or two more. The varieties of fruit are so many, and their success so local, that these neighborhood meetings are of the greatest value. Begin them in the afternoon, so that the orchards can be seen, the pruning explained and criticized. If the names Horticultural or Pomological Society seem too formidable, call it a Fruit Club, and don't spend time about constitutions.

Is Lobelia a Poison?

—In October last, we protested against the recommendation in the reports of the Farmers' Club of the use of so "violent a poison" as lobelia. This has brought out a number of letters, some defending lobelia as the most harmless of weeds, and others asking our authority for the statement. We could give any amount of authority, but we turn to the first one at hand, Taylor's Medical Jurisprudence, and find that in England, in 1833, the coroner's jury brought in a verdict of manslaughter in six cases of poisoning by lobelia. We do not consider lobelia to be any more poisonous than many other drugs; we object to the recommendation of the indiscriminate use of any potent drug. Lobelia has its place in medicine, but, like every other violent poison, it should only be administered under proper advice.

A Long, Straight Shot.

—During the night of Nov. 20th, a huge mass of iron, (the steamship Alleppo), was shot out from the south end of Ireland westward, and kept in rapid motion 290 to 330 miles a day, by steam and wind power. The winds blew in great gales, now from one direction, and now from another—at one time with such force as to tear a strong sail into a thousand tatters. The sun and stars remained so concealed from view as to prevent any accurate observations. The compass, as is well known, varies as much as 30 degrees from the true north in some parts of the Atlantic. No land was seen, and no ships spoken that could tell us where we were, yet so nicely were calculated the varying effects of the different winds, the ever-varying velocity given by the sails and screw, with the retarding of the head seas, and the changes required by the compass' variations, that on the first sight of land, on the morning of the 30th, we were only a few miles south of Fire Island Light House, or just where we wanted to be! That immense floating mass can thus be hurled forward more than 330 miles over a wilderness waste of waters, adrifted everywhere by so many changing influences, and yet strike at exactly the desired point, is wonderful, to say the least. What would Columbus say if he could return, and now cross the Atlantic in a steamship!

Crossing the Atlantic.

—The failure of the Great Eastern, last May, after the leading passenger ships were fitted, drove us into the Tripoli, of the so-called "Extra Cannon Steamers." We were so well pleased with the ship, its officers, and all its appointments, that we came home from *choise* in one of the same class of ships. These steamers, strongly built entirely of iron, though designed mainly for freight, have a dozen rooms or so for Cabin passengers, located on the deck, capacious, well fitted up, and airy, with large windows looking out upon the sea. The table is served the same as upon the mail steamers, with plenty of attendance, and the cozy, uncrowded dining saloon is more agreeable than that of regular passenger ships, while the fare is

lower. The only objection is, that they are usually a day or two longer in making the passage—a thing of no consequence to those who go for pleasure, as the sea voyage is usually enjoyed after the first few days of "breaking in." And the time is not bad, usually within twelve days, from New York to Liverpool. We left Queenstown in the Alleppo, Capt. Harrison, on the evening of Nov. 30th, and reached Sandy Hook before noon on the 30th, making the passage in 9 days and 23 hours, allowing for the change of time. From our pleasant experience on the Tripoli, last May, and on the Alleppo, in the boisterous month of November, we can advise our friends crossing the Atlantic, to look out for the Alleppo, the Sibiria, the Palmyra, the Tripoli, the Tarifa, etc., of the Extra Cannon line, and if they can fill in with Captains Martyn, Harrison, or Watson, they will be fortunate, we are sure, though for ought we know the other Captains of this line are equally as pleasant and efficient officers.

Another Foot Warmer.—Mr. Judd, not being aware that we had an article on this subject already printing on the inside sheet, (page 35), sends us the following: "Keep the head cool, and the feet warm," is the old wise adage, put forth when people walked more than now; but how is one to keep his feet warm in a cold church or in a railway or other carriage? I picked up in Paris, (for 12 francs, or \$2.35 specie), a convenient *Foot Warmer*, sketched herewith. It is a tin case of the form shown, 11 inches long, 8 inches wide, and 3 inches

Fig. 1.

through in the middle; one edge is thicker than the other, to fit it to the bottom of the feet when it lies on the floor. The tin case is closely covered with dark green carpeting. A small brass funnel is fitted into one side of the end, and inside, at the bottom of this, is a tightly fitting screw, of the form shown in Fig. 2. The small handle is very convenient for carrying it to church, where the floors seldom get well warmed at morning service. One of these well covered, and filled with hot water, retains its heat a long time. Ours was filled at London, and on a bitter cold day kept the feet of two ladies warm all the way to Liverpool, 300 miles, and when the water was poured out there, it was still a little warm. This can be used as bed warmers also. It may be of any desired size, and long enough to accommodate three or more persons. The form and size of ours is a convenient one for carrying in the hand; the dark green covering renders it inconspicuous. Any tin-worker can make one for a few shillings, and it can be covered at home. The funnel and screw as sketched is the most convenient form we have seen; probably a good cork, fitted tightly, would answer, though it would perhaps leak slightly. If a cork is used, this and the carrying handle might be placed so as to always be on the upper side, and thus prevent leakage.

Fig. 2.

Painting.—With a little practice, any man can use a brush well enough for common purposes, and in all moderate weather outside work may be done very well at this season. Living rooms ought not to be painted except at a time when the windows can be open.

Keeping Fish in Moss.

—In December we gave an article on Peat Moss (*Sphagnum*) and its uses. Mr. C. F. Austin, an enthusiastic student of mosses, writes us of another use for *Sphagnum*: "When I was down in the pines of New Jersey I was told that fresh fish could be kept better in warm weather if wrung up in this moss than in ice, and I gave it a trial. I took from a can about a dozen pickerel, and a lot of catfish and eels, and put them up for a friend in New York—all alive—in a basket of sphagnum, at nine o'clock in the morning on a hot day in June, and I was told by a member of his family that the next morning when the basket was opened in New York every fish was alive."

Coal and Peat Ashes.

—W. D. Arnold. If they are half peat, as stated, it will pay to cart them several miles. On moist clay loams, coal ashes are a good top dressing, and you may expect to get pay for your labor if you cart them a mile.

Sour Milk for Laying Hens.

—W. S. S., Maine. Hens will eat eagerly almost any kind of animal food, in the winter, and will be benefited by it. We have fed butchers' offal from the markets, chandlers' greaves, clams, small fish, and sour milk. The laying in

winter depends quite as much upon the physical comfort of the bird as upon the feed. They must have both shelter and warmth if they are expected to lay.

Churns.

—"Which is the best one?" We have had quite a number within a few months for trial. Child's "Aerator" Churn works with great rapidity, and produces butter which cannot be excelled. The "Julien Churn and Butter Worker" turns faster, and produces equally good results, but not so rapidly. Both are good.

Small Hard Coal Most Economical.

—There is a very common opinion that large coal burns longer, and is, therefore, the cheaper. Dealers have to put the finely broken coal at a lower price, to get rid of it. This opinion we believe to be erroneous. (We speak of the hard or anthracite coal; the soft or bituminous coal, which will burn in the single piece, may well be of large size.) With large pieces, one must have a considerable number of them to keep the fire burning at all. A given weight of coal will in burning throw out the same amount of heat, whether it be in large or small pieces. If of small size, a thin layer over the grate will supply heat enough for all usual temperatures, and for cooking, and be quite as effectual as a deep mass of large lumps. A layer of two to three inches of nut or pea coal will usually do better service than six or eight inches of stove or egg size, either in cooking or warming a room. After examining the subject experimentally and theoretically, we have come to use mainly pea and nut coal for the cooking range and small stoves, with a moderate quantity of stove size when a strong fire is needed during the middle or latter part of the day. We also use the pea coal for starting the hot air furnace in the morning, with a little during the day to fill in the spaces between the large coal, which saves the use of a deep bed of it when but a moderate heat is required. When a fire is needed over night in the furnace of the dwelling, or in the greenhouse, we bed with a layer of large coal, all the interspaces with pea coal, and cover with ashes, or regulate by the draft door. A small quantity will thus remain ignited all night, when, if so small coals were used, a foot in depth of large coal would be required to keep the fire from going out. We are convinced that most families would find it economical to use more small coal, and less of it, in order to secure a quick, constant, and lively heat.

Starting a Fire.

—"It takes a fool or a philosopher to build a fire well," runs the old adage. We suppose the former blunders into doing it well, and the latter goes at the work scientifically. As few people belong to either of the two classes, there must be much poor fire kindling—and there is. With wood fires, the essential thing is to have a few thin pieces of dry stuff; then the larger pieces brought near enough together to keep each other warm; and, most of all, to arrange the whole so as to secure a draft. Place the fuel so that air can enter underneath, and so that the first heat can produce an upward current, and draw in fresh air to the burning point. With hard coal, there must be kindling enough at one point to produce sufficient heat to ignite at least two or three pieces of the hard coal, and then concentrate the draft of air upon the ignited point. With plenty of kindlings, the grate may be covered, but with only a small quantity of under, it should be placed all together in the middle or at one side, and a few pieces of small coal be put around it. If the grate be larger than the size of the hand, it is well to cover all but the kindling point with ashes, to confine the draft to that place, and then remove the ashes as the fire spreads. A small layer of thin paper spread over the grate under the coal, and opened directly under the kindling point, is very useful. It confines the current of air to the kindling point, and burns away as the fire spreads.

Fire "Kindlings."

—A good supply of these often gains half an hour's time in getting work started in the morning. Previous thorough drying is essential. A few fine shavings or slivers, and then larger well dried pieces to get up a strong heat at one point are better than all fine stuff. In some European countries we found the common kindling material to be shavings dipped in melted resin or pitch, and then wound in balls two or three inches in diameter, like knitting yarn. They were very effective, seldom failing to ignite wood or coal, though where hard anthracite is used, a little charcoal is placed around the pitch ball. These balls are clean, easily handled and used, and are sold by the piece or by the measure, like potatoes here. (In most of Europe, potatoes and other roots, and all kinds of fruit are sold by weight, as they should be always—eggs included.) Another novel kindling material, in common use in several places, is pine cones. Those we saw at hotels were very effective in starting wood fires. They contain resin enough to give a flame for several minutes, if there be a little draft.

Compost.—"W. B. B." The wood mould will make an excellent garden compost, if mixed with one-third its bulk of stable manure, and worked over after the fermentation has become active through it, which may be known by the warmth, tested by a stick or two kept thrust into the heap. Laid up with strawy manure, trodden pretty hard, and wet with bern-yard water or stable urine, it will also make good compost, if treated in the same way. Spread in layers, and sprinkled with dry slaked, (not air slaked,) lime, using about one bushel of the unslaked lime to the load of mould, it will probably become very fine and powdery, and will, at any rate, make a nice top dressing. It would be valuable also for making soils for potting plants, and mixed with manures of any kind, guano, bone-dust, hen manure, etc., for fine composts for top dressings, for corn in the hill, and many uses. The first way of disposing of the leaf mould will probably be the most profitable, if you have much of it.

Best Use for Wood Ashes.—They should be kept dry, and free from chips and sweepings, and bones. If bones that would be long decaying, and that cannot easily be broken up fine, are burned in the fire, they may be pounded fine, and may then be left in the ashes. There is no garden or field crop which ashes do not benefit. Perhaps the best use for a portion, at least, is in the onion bed. Leaf mould composted with ashes, makes an excellent dressing for strawberries, worked into the surface between the plants.

Coal Ashes.—The best use to which coal ashes can be put in winter, is probably to mix them with some night soil in the privy, using them every day or two, to keep the contents dry and covered. They must be thoroughly sifted, free from large bits of coal, slate, or clinkers. Coal ashes may be used to good advantage as a top dressing for grass, or mingled with stiff, clayey soils.

One Handful of Hay is a small matter; one handful a day for six months makes a pretty large bundle; twenty handfuls a day for six months make quite a stack; if each handful weighs a pound, the stack will equal 3,650 pounds, or more than 1½ tons—worth about \$22, at \$12 a ton, or \$36.50, at \$20 a ton. How many farmers, keeping twenty animals, allow each to waste a handful or a pound of hay a day for want of a little attention to the feeding arrangements? A few straws at a time, dropped here and there, and trampled under the feet, will soon make a handful, and we have seen above what the handfuls amount to. This is a small matter, says one, but upon just such small matters depends a man's success or failure. One man attends to them, and at the end of twenty or thirty years has a competence for old age; another neglects them, and is always behindhand—he lives and dies, short in the pocket, and short in comfort.

A Handful of Hay is a large matter, as shown above. Suppose an animal in a warm stable to require 15 pounds of hay a day to supply the waste and growth of the body, and keep up the heat. A small crack to let in a stream of cold air will necessitate at least another pound of hay per day to furnish the extra internal heat required. Even the difference between a cold and warm shed will often increase the consumption of hay by two or three pounds a day. A single wind break or screen of evergreens or straw, or a tight fence, may save two pounds a day on each animal thus sheltered. "A word to the wise is sufficient."

A Single Handful of Manure put into a hill of corn will often make the difference between four or five little "nubbins," and six or eight great plump ears that will sell their bulk of sound corn. A thousand handfuls count up heavily in the autumn corn crib. How many handfuls of manure are daily lost in your stock-yard that might be saved in nice order by a little care in heaping up, and covering from washing rain? These handfuls of manure are more valuable to the cultivator than the separate grains of gold that the miner, with careful toil, gathers and washes from the earth and sand bank. He hunts, gathers, and saves them all, and thus accumulates his "pile." Philosophical, successful cultivators, can see the glitter of gold even in the manure heap; they only wait a little longer than the miner for the pure gold to be washed out by the growing process, instead of in the wash pan. "A word to the wise is sufficient."

Fall Show of the American Poultry Society.—This youthful society held its first exhibition during the first week in December. No money premiums were offered—two silver cups, silver and bronze medals, diplomas, and books, being the prizes. The show of fowls was by far the best we have ever seen in this country, and though a really good hall could not be secured, and the light was very poor, yet all who visited the exhibition, and took pains to study carefully the different

coops, were gratified and instructed. The most noticeable features of the exhibition were the Brahmas, Cochins, Gray Dorkings, Black Spanish, and French Fowls, (Crevecoeurs and Houdans). White Dorkings and Games were tolerably well represented, as were also Hamburgs and White Leghorns. Bantams have marvelously increased the number of varieties within a few years. This department was rich in fine specimens. The Seabrights, the most beautiful of all, and most difficult to breed true to markings, were not numerous. The Polands, Black and Golden, were excellent. There were several remarkably good pairs of ducks, both Aylesburys and Rouens, and a number of couples of ornamental ducks. White China Geese were in full force, presented by several exhibitors. E. A. Wendell had some remarkably fine Bremen Geese. J. Haven exhibited beautiful Lop-eared Rabbits, taking 1st and 2nd prizes, and there were several exhibitors of pigeons, making an attractive show at one end of the hall—Pouters, and Tumblers being most prominent.

The show was remarkable in all classes for the great excellence of the stock exhibited. The \$25 cup was awarded to A. M. Halsted, and the \$15 cup to C. O. Pool; the former for the best and largest collection of poultry of different varieties, the latter for the best and largest collection of different varieties of fowls.

We know it is exceedingly difficult, if not impossible, to conduct such an exhibition, so that no one can, with any show of justice, find fault with its management, and it is with no carping or fault-finding disposition that we make note of some things which ought to be avoided at future exhibitions. For instance: In the first prize Brahma coop, the cock had but one eye, a disqualification for competing at all. The first prize Aylesbury duck had black streaks upon her bill, which, according to Tegetmeyer, the authority relied upon by the society, is also a disqualification. This award is the more noticeable, as the beautiful pair of Mr. Haines had no such blemish, and were otherwise apparently as fine. We do not ourselves believe that the judges were knowingly biased in their judgment, but the facts stated, with many others we might name, were the subjects of comment among the visitors to the show.

A Treatise on the Mule.—The superintendent of the government Corral, at Washington, Mr. Harvey Riley, has given to the public, through Dick & Fitzgerald, publishers, a practical treatise on the mule, of really solid value. It is a work of 107 duodecimo pages, illustrated by 14 lifelike engravings, from photographs, all portraits of army mules famous for either good or bad qualities. We have only space to give the book a very hearty welcome. The earnestness of the writer, his familiarity with his subject, his excellent common sense, and his clear way of putting home truths, lead one to overlook a lack of system in treating his subject, which is really of no disadvantage to the reader, who will be the more inclined to read the book through; if one is really interested in the subject, he can hardly help doing so. The book should be in the hands of every mule owner or driver who can read.

Wallace's American Stud-book.—Volume I of this work has appeared. Published by W. A. Townsend & Adams, New York, 1897, containing 1017 large octavo pages, and embellished with seventeen well executed steel engravings of famous American horses, both thoroughbreds and trotters. The work gives evidence of very thorough, conscientious labor, and honesty of purpose. Twenty-four pages only are devoted to preface and introduction, the remainder being: 1st, the stud-book proper, giving pedigrees of horses, from "No. 1, Abeline, gr., to "No. 2821, Zohrah, b." and, (we estimate), 2480 mares, regarded as thoroughbred; 2nd, an appendix of "pedigrees not extended," containing some 3600 names; and, 3rd, a trotting supplement, containing the names, pedigrees, and occasionally bits of history, breeders' and owners' names, of some 900 of our famous trotting animals and of young horses coming of stock of high repute on both sides. The work is very valuable to horse breeders, and of interest to all owners of thoroughbreds or fast trotters. Sent by mail for \$10.

Another Horse Book.—"Horse Portraiture," by Joseph Caird Simpson, 453 pages, 12mo., published by W. A. Townsend & Adams, New York, 1898. This is a gossiping book, containing a great deal of valuable information about the breeding, rearing, and training of trotting horses, their management in the stable, on the track, and in preparation for trials of speed, thoroughly drilled and diffused through every such "horse talk," anecdotes of horses and horsemen, etc. The author selected for his book the most tiresome of all styles, to us, that of the rhetorical and high-flown dialogue, as if the whole book consisted of 1-minute to 15-minute speeches, alternately pronounced by "Preceptor" and "Pupil" in the most absurd and unnatural way. The absurdness is not less marked when we find "Pupil" eagerly instructing "Preceptor" in some of the simplest matters of horse-

manship. There is, as we have said, good in the book,—how much, it is hard to tell, for the "Contents" runs over eight pages in fine type, and there is no alphabetical index of subjects. It is pleasant reading, and when anything that may be of future use is found, the reader should be sure to make a note of it.

Half Buffalo Beef.—After the article on crossing the buffalo with our common cows, on page 13, was in type, we learned with no little regret that the cow had been sold for slaughter. Just as we are closing the paper for this month, we are able to add our opinion of the quality of the beef, having dined with Mr. Swain at one of our best restaurants, where the carcass had been purchased. The animal had been dry but one month, and though in fair condition to begin with, surprised every one with the amount of fat laid on in so short a time; yet she was far from fat. The beef was moderately marbled, of a bright red color, and the fat had a golden hue. We eat roast beef from the fore quarter, rib pieces, and tenderloin steak, and found it equal to the best beef we have ever eaten, if not superior. We regret all the more that this fine young animal could not have been kept to become the mother of many heaves or heifers like the one Mr. B. still possesses, in order that the peculiarities of her race as milkers and beef makers might be the better determined. Circumstances made it impossible for Mr. Swain to keep her, and he had offered her to any one who would breed from her, at a very low price.

Sale of Imported Stock.—The first sale at the Clifton stud farm, Staten Island, occurred Nov. 19th. The stock was recently imported by R. W. Cameron, Esq., and consisted of Short-horns, Devons, Alderneys, and racing horses. Most of the cattle sold at only moderate prices. The best two Alderney heifers, to calve in the spring, brought \$395 and \$350; the best two Short-horns, \$400 and \$410. Two Guernsey cows brought \$310 and \$235. The horses, mostly under two years of age, though of excellent pedigree, did not secure satisfactory bids, and were withdrawn, with few exceptions. \$2000 has come to be thought a small price for a racing colt of good promise.

Manure Pit.—"X" asks: "What kind of cement must I use to make a liquid manure pit, when it would freeze?" Good water lime, (hydraulic cement,) commonly called "cement," will usually set in a few months, so as to be frost-proof and water-tight.

Spent Tan Bark.—This article, so often used for road making, or thrown into the river to get rid of it, may be economically used in several ways. It makes good bedding for horses and cattle, and keeps the stables sweet. When saturated with urine, it should be thrown into the compost heap with the other manure. It may be used to good advantage in styes or privies, or wherever absorbents are needed. It is good to mix with heavy clay soils for the purpose of making them lighter. It is serviceable in a compost heap to mix with fresh stable manure. If thoroughly dried, it makes a slow fire, of use in mild weather to temper the heat of wood.

Roofing.—"Would a board or shingle roof be any better if it should be painted with gas tar, and then sanded?" Ordinarily not. A board roof would probably last longer. If the tar be applied when the boards or shingles are laid, and all parts exposed to the weather or not, except the under side, painted over with hot coal tar, as the work proceeds, and, finally, fine sand thrown on the whole, a very durable roof will be the result. Water from such a roof will taste of coal tar for a long time.

A Workshop.—A farmer is "accomplished," if, in addition to sufficient knowledge of farming to be successful, he has enough of one or two good trades, so that he can turn his hand to them, and do fair sort of work as his needs require. Most farmers must do some carpentering, and all ought to be handy with joiners' tools. The ability to use an awl and waxed end in patching harness comes often in play, and when a man can do a neat bit of soldering, when his wires leak, he will find his soldering iron and accomplishments among the most essential articles of his shop furniture. Every farm should have a good workshop, with all the tools in it that the farmer has occasion to use, if he can use them well; keep them constantly in order for immediate use.

Clipping Horses.—"D. W. T." This is an old custom in England, and is getting to be quite common among horsemen in our cities. We have never heard a good argument in its favor. At this season of the year it is quite dangerous, as the shaved horse requires the closest watching to keep him from taking cold. Nature provides a thick coating of hair for the protection of the horse, and with this he is none too well guarded against the extremes of our severe and changeable climate.

Steamed Bones.—"D. W. P." Rhode Island.—If you have steamed bones mixed, as you say, with half their weight of sandy loam, they will decay considerably in the course of a year, and we would leave them as long as that, working them over, and adding more loam twice in the mean time. At the final working over of the heap, rake or fork out the coarse bones, and mash the rest. It will make an excellent manure for potatoes, corn, small grains, or grass; also excellent for the garden, and for fruit trees. You may apply it at the rate of one ton of bones to the acre, though much less, down to 100 or 200 pounds, will be productive of marked results.

Value of Road Wash.—"C. T." Turn all of this article you can upon your meadows and pastures. The increased yield of grass will show its value. There is some manure mixed with it, and a part of its effect is probably due to its fineness, occasioned by the continual tramping of iron shod feet and the grinding of wheels. Where this wash collects in hollows by the road side, it will pay to cart it into the yard or stables for an absorbent, or to spread it broadcast upon the meadows.

The Early Rose Potato.—This is a seedling of the Garnet Chili, but unlike its parent in color and quality. Mr. Jefferson of Ulster, its introducer, informs us that it is more productive than the Early Goodrich, and ten days earlier. It is a very fair and handsome potato, and of some excellent quality. We were present at the trial of some fifteen varieties by a committee of the Penn. Hort. Society, and considered this the best of all. Mr. H. has disposed of his stock to B. K. Bliss & Son.

H. W. Beecher's Farm, near Peedskill, has 33 acres. The sales amounted to about \$3,700, in 1866, and to about \$4,000, in 1867. Six laborers are employed upon the place, which is one of the secrets of its productiveness. Is it not about time to discard the plan of working a 200 acre farm with one hired man?

The Horse Crop.—The value of cattle, sheep, and swine, in Illinois, is about twenty-six millions of dollars; that of horses is thirty-two millions. Similar statistics come from other States, showing the increased attention paid to this animal upon the farm.

Mule Teams vs. Horses.—The popularity of mule teams in our cities and on southern plantations is well known, and has an economical basis. It is claimed by those who have large experience with both kinds of teams, that the mule can be safely worked at an earlier age, and more hours in the day, that it will keep in good condition on coarser and cheaper fare, and bear neglect much better, and that it is a serviceable animal for at least three times as long. We know of no reason why they should not be more used upon northern farms.

Peat Questions.—A. B. T. We do not hear much now about the manufacture of peat for fuel. When coal was twelve dollars a ton, it was a matter of great importance to find a substitute. With coal at four or five dollars a ton, it is the cheapest fuel in market, and the peat bogs will have to wait for another generation to burn them. Some of the peat machines are still running, we believe, but the business is not lively. There is no speculative call for peat lands, and those who own them need not be afraid to use or sell them to make compost. This will probably be their best use for some generations.

Collar and Hames for Oxen.—J. B. recommends this instead of the yoke. "They work with more ease, carry their heads higher, and look better. I have worked oxen in harness, in pairs to the plow, with single line, and found them as tractable as horses. Why should progressive America follow the barbarous yoke longer?" The barbarity of the yoke is not very clear.

Improvement of Reclaimed Salt Marshes.—G. Smith, Harwich, Mass. The principal use of flowing, the present winter, would be to take the salt out of the surface, but if the sea water be shut off, the surface will be ready for grass seed, by the last of March. As to the kind of crops for such lands, we think grass will pay better than anything else, at least for the first ten years. The marsh sod is exceedingly tough, and it would take years to rot it. For grass you need no plowing. Sow immediately upon the sod, the last of March, a mixture of seed, say two pounds white clover, six pounds of red clover, and six quarts of Timothy, to the acre. Surface drainage should be attended to, and for this purpose we have found narrow drains, eight inches wide and two feet deep, about four rods apart, and running at right angles to the creek that traverses the marsh, to be effectual. A complete system of tile drainage would be better, but it involves a large outlay. The narrow surface drains are cheaply made, and the mowing machine, rake, and cart, can be readily run parallel with them. The

tile draining can be introduced later, if it is found to be desirable. We have used several kinds of top dressing, and found them all good and paying for the use. Coarse gravel, spread half an inch thick, and the coarse stones raked off, made a decided increase in the yield of hay. Garden soil and surface loam did much better. Stable manure was better yet. Mud from salt water ditches composed principally of decayed sea-weed and other marine vegetation, had about the same effect as stable manure. As this is generally accessible near reclaimed marshes, it will probably be the most economical application after the first three seasons are past. It should lie upon the banks of the ditch, or in heaps elsewhere, a few months before it is spread. The salt grasses will not disappear wholly for several years, but will improve in quality. Keep sowing the grass seed until it gains full possession. A marsh from which we shut off the tide water in the fall of 1853, is still in good condition, and the first tide gate still remains. These reclaimed marshes are the best grass lands in the country, and we are glad to see the efforts to improve them.

Artificial Incubator.—Leach & Higgins, of Mass., exhibited one of these articles at the recent Poultry Show. It is in the shape of a box about three feet long, by two feet broad, and two feet high, divided into several stories, for the accommodation of the eggs and the newly hatched chickens. The heating apparatus is a lamp outside, communicating with pipes that traverse the interior. The heat is kept from 80 to 105 degrees (Fahrenheit) for hatching, and for nursing the chickens. Good fresh eggs hatch in 30 days, and come out strong and healthy. The expense of oil for the lamp is about four cents a day. Seventeen dozen eggs may be hatched in it at once. It is claimed, for this chicken factory that it is surer than the mother hen, that it guards perfectly against the enemies to which chicken life is exposed, and makes poultry raising a uniform success. The machine looks as if all this might be true, but we have to remember that all former attempts at artificial incubators have been, practically, failures. If half they claim is true, the patentees have a valuable invention. The price, \$300, it strikes us, is out of all proportion to the cost of the article, and in this respect the patentees stand in their own light, for the principle cannot be patented, and they will find imitators. It is to be taken into consideration that the hatching of chickens, especially out of the usual season, is but a small part of the cost of raising them. They must have artificial heat and protection for several months after they leave the incubator. What shall we do with the chickens, after they are hatched, is a question that would bother most people more than the hatching.

Coarse or Fine Feed.—F. Smith. That depends somewhat upon the animal fed. Fowls have a powerful grinding apparatus, and need something to keep it busy. Sheep are said to do quite as well on whole grain as on that which is ground. All the bovine race, horses, and mules, especially when worked, thrive better on cut feed and meal. Careful experiments show that swine fatten much more rapidly on ground and cooked food.

Liming and Plowing Land in Fall or Spring.—F. Smith. Good usage differs, and we suppose either depends somewhat upon the circumstances of the farmer. It is desirable to keep the lime as near the surface as possible, and those who spread their lime upon the sod in August, and plow the following spring, claim that the lime is brought up with the inverted sod, and they have the additional advantage of a much heavier sod made by the spread lime, which stimulates the growth of the grass. Those who plow clay loams in fall, claim that the frosts are a great advantage, that insects are destroyed, and that spring work is put forward. We prefer spreading lime upon sod, and plowing the following spring, just before the corn is planted. See articles on Liming and Rotation, Vol. 23, pp. 283 and 288.

Compost from Dead Animals.—J. B. Our correspondent from Indiana takes exception to this kind of compost, which we have so often recommended, on account of the disgust of handling it. He says, among many other things, quite as little to the point: "My plan is to bury any dead animal as quickly as possible, and not leave it above ground for a nuisance to myself and the whole neighborhood, to breed a pestilence, endangering the lives of the human family. It is difficult in this country to get even common barn-yard manure hauled out, leaving dead horses and dogs out of the account. I did last fall accidentally manage to get a hand to help me haul out my barn-yard manure which had been accumulating for eight years, and we had a good crop of wheat after it. But had this been of your kind of manure, there would have been an exodus from the farm of every living soul on it."—Our plan agrees with our correspondent's in burying the dead animal; only we would put the carcass

into a muck heap, where it will be of use, rather than to the ground, where it will not. It is not necessary, as he supposes, to cut up a dead animal. The only advantage in this is to hasten decomposition, and to make the compost available earlier. If you use muck or peat enough, there is no more odor from a decomposing dead body in a heap than in the ground. The muck absorbs the gases fast as it escapes, and will absorb the whole of it, if it lies long enough. The advantage of forking over is that it hastens the decomposition, and more thoroughly mixes the flesh with the peat or muck. The mass becomes finer and is sooner fit for use. If a man has a very delicate stomach, we should not recommend him to fork over the heap six weeks after it was made, especially on a July afternoon. But if he has lain a year, very little, if any, flesh remains, and the mass has not much more odor than stable manure. We have made many hundreds of loads in this way, and have never found any difficulty in working among it ourselves, or in getting others to do so. The crops are so green and luxuriant where this compost is spread, and the harvest is so satisfactory, that we rather like the smell of ammonia, and shall run opposition till the crows, in speaking for old horses in the season. We are sorry that our correspondent puts us down among the kid glove gentry. We affect cowhide boots and back-skin mittens, and greatly prefer the odors of the compost heap to the most delicate perfume of Lubin. If one has too big a nose, he should leave the farm.

Farming in Florida.—The papers report that "Mrs. H. B. Stowe has a farm of 400 acres, at Mandarin, on the St. John's River, about fifteen miles from Jacksonville. It is a few miles off river front, and a sweet orange grove of one hundred bearing trees, with an annual production of 60,000 oranges, and many smaller trees. The annual crop of oranges is said to be worth \$1800." There is plenty of the raw material for just such farms in that State. Oranges and other tropical fruits grow with great luxuriance, and the climate is healthful as well as pleasant. For Mrs. Stowe such a piece of property is a matter of luxury. For others it might be a safe money venture, or furnish business and a home for life.

Editorial Jottings in Europe.

[Mr. Judd has arrived safely home, after an interesting, instructive, and very successful tour of over six months in different parts of Europe, having traveled more than 19,000 miles, with part of his family, including children of 8, 11, and 15 years, and not having experienced an hour's delay by sickness or storm; the railroad train fell behind time or failed to connect, and a man item of luggage went astray. This certainly speaks well for the management of European railways. After a few days' rest and arrangement of delayed business matters, he will resume his former labors, and devote his chief attention to the *Agriculturist*. We have on hand some of his letters, extracts from which will doubtless interest our readers. We give now, out of order, his latest letter, as it refers to Mount Vesuvius, whose present active eruption renders it an object of immediate interest.—ASSOCIATE EDITORS.]

.... NAPLES, Nov. 4th, 1867.... We had some difficulty in getting here from Rome. The carabinieri's troops, whose encampment lay in sight of Rome all the while we were in the city, had interrupted the railway train which would have brought us here direct, (163 miles) in eight hours. So we went north-west 43 miles to Civita Vecchia, pronounced here, *Chiv-e-tah-rah-kah-ah*, where we found the harbor all alive with boats landing the French troops, and we were detained about a day. A French steamer brought us hither in 16 hours, or two days from Rome.

.... "I wonder not at the great interest every traveler feels in Naples and vicinity, and I wish our few days' stay could be as many weeks. A volume would not suffice to describe what we have already seen. Naples is the largest city of Italy, and contains about half a million inhabitants. It is on the north-north-east side of the wide Bay of Naples, which sets up from the Mediterranean Sea inland 25 to 30 miles. Mount Vesuvius is 3 to 2½ miles inland from the head of the Bay, or about 7 miles south-east of Naples. Going around the Bay from Naples 8½ miles, you come to Herculaneum, which is covered 25 to 40 feet deep with lava which ran down the mountain, burying the city in its course. On the soil above Herculaneum now stands the large town or city of Resina, literally a city upon a city. Starting eastward from near this point, you ride up the inclined hill-side, over the old lava current, the surface of which has become in part a cultivated soil, mainly planted with vines, and three miles from the bay, at an elevation of 2000 feet, you reach the steep mountain, which at a distance looks like a cone rising above an elevated plain. Leaving the mules here, one clambers about 2000 feet up the almost perpendicular sides, over loose lava stones. The top which looks flat at a little distance, is a hollow basin, one quarter to one

half mile in circumference. The lava or melted stone appears to have boiled over on all sides, and then, in cooling, to have sunk down a few yards, leaving a basin on the top of the mountain. This basin is covered with scoria or loose black lava, and lighter colored ashes. There are some fissures in the bottom of the basin, from which sulphurous fumes arise, but the mountain has been nearly quiet for half a dozen years. [See below.]

"...Coming back down to Herculaneum, or Resina, you go on south along the head of the Bay, and then south-east, crossing several elevations, which are formed by the immense streams of lava that at various periods have flowed down the sides of Vesuvius in different directions. Nine or ten miles from Naples, that is, around on the south side of Vesuvius, you come to the partly excavated city of POMPEI, (pronounced here Pom-pay-ye.) This was upon a south-east arm of the Bay, which has been partly filled up by lava, throwing the site of the city inland half a mile or more. Pompei was destroyed or buried in the year 79 A. D., or nearly 1800 years ago. The lava that boils out of the top of Vesuvius, usually runs slowly down the mountain side, giving the inhabitants time to escape. People seem to have little fear of actual danger, for the whole country all around the foot of Vesuvius, and partly up its slopes, is very thickly inhabited—indeed there are in this vicinity more inhabitants to the square mile than in any other country place in the world, I believe. It appears that the people of Pompei were scared out of the city by a lava stream which did not reach the walls, but that 400 or 500 remained, or returned, when an immense mass of lava was hurled from Vesuvius, and fell in a thick cloud of ashes and rapilli or fragments of pumice stone, filling up the streets and houses, and covering the whole to a depth of 45 or 50 feet. The top, by the action of the elements, was formed into an arable soil, and afterwards cultivated, the city itself being buried, and lost sight of for more than a thousand years! During the past 250 years, and especially in the past 40 years, the government has been uncovering parts of Pompei, and removing the ashes and rapilli from the houses and streets, which have been preserved almost entire. The roofs of the buildings were mostly crushed down, but the outside walls are almost all standing. The streets, with the paving stones deeply worn in ruts by the wagon wheels, are as perfect as if left but yesterday. You see the plastered walls of the rooms, with fresco paintings nearly perfect, and the floors are generally in beautiful mosaic, well preserved. Houses, shops, temples, public buildings, many of them still retaining the finest carved marble pillars, statuary, etc., fill up the excavated portion of the city. All kinds of implements, for the household, for the mechanic arts, etc., are preserved just as they were in use eighteen centuries ago! Many thousands of these are collected in the Museum at Naples, and after examining them, and seeing how much they are like those of the present day, one feels the force of Solomon's remark that "there is nothing new under the sun."....

We spent four hours, until thoroughly wearied out, in walking through the streets, and examining the buildings and yet visited but a small part of the uncovered portions, while about two-thirds of the ancient city is still buried, as is shown by the outer wall, nearly 1½ miles in length, which has been traced out, and by the experimental diggings in the inclosed soil.

"...Herculaneum is buried so deeply, and the modern houses are so numerous above, that only a few of the buried structures have been cleaned out. We walked through the great amphitheatre, large enough for the population of an extensive city. It is 25 to 40 feet below the streets of the present village, and was discovered in sinking a well.

"...The ride westward from Naples along the north side of the Bay, is intensely interesting. We first pass through the mountain ridge by a tunneled road, (Grotto of Posillipo), half a mile long, 30 to 75 feet high, and 25 to 30 feet broad. It was cut out of the solid rock, long before the Christian era, probably. Virgil's tomb is near the entrance of this. Beyond the grotto, three or four miles, we went to the naturally heated sulphur caverns and baths, and to the Dog Grotto—where a dog at our feet fell down envenomed by the carbonic acid, which did not rise to our own heads. We next visited Pozzuoli. This was the ancient Puteoli, where St. Paul landed after his shipwreck, (Acts xxviii, 13.) The old "Appian Way," still partly visible, is here seen; it extended northward 120 miles or so to Rome. Just east of Pozzuoli, we went into the crater of Solfatar. This is a flat bottom, round basin, 30 acres or so in extent, the rim 20 to 30 feet high, and the bottom covered with white volcanic salts, sulphur, alum, and chalky ashes. In treading over it, it sounds hollow, as if you were stamping upon the head of an immense bass drum. At one point, steam and sulphurous gases boiled forth with a sound like a great blast furnace. We cooked some eggs in the mouth of the fissure, and the air around was filled with sulphur, that the silver coins in our pockets were blackened in a few minutes. ...The eruption of Solfatara, in 1198, buried part of Pae-

zuoli, including the great amphitheatre where Nero acted as a gladiator, the uncovered ruin of which we visited. The ruined temples of Jupiter Serapis, Neptune, and the Nymphs, the hot springs, etc., are interesting objects. Northwest of Pozzuoli is the Monte Nuovo, a conical mountain heaved up in 1538. Beyond this is the Lake Averna and the Sybil's Cave, of Virgil. Further north-west, over on the shore of the Mediterranean, are the ruins of the ancient Cumæ, buried by one of the many volcanoes which have disturbed all the region around Naples. The immense gateways and other structures, partly exhumed and uncovered, show the greatness of the lost seaport city. We rode two miles or so right over the buried dwellings of this once populous town. Turning southward, we went to the point of land formed by the Bay of Naples and the Mediterranean. Here are the ruins of Baia, with its partly uncovered temples and other buildings; the harbor of Misenum, where the ancient Roman fleet was moored; the vast reservoir, (Piscina Mirabilis) which contained fresh water, brought by the Julian Aqueduct a distance of 40 miles, to supply the ships; the 365 baths on the shore of the Bay of Baia; many ruins of ancient Roman villas, etc. This region was the fashionable resort of the Romans, especially in summer. The volcanic nature of the whole surface, and the many classic associations with Roman history, render all this region one of most intense interest.

"...OF NAPLES I have not time to write, and the country around is far more interesting than the city itself. It encircles the north-north-east shore of the Bay; has one wide beautiful street, the Toledo, and others of moderate pretensions, but they are usually very narrow, like those in most ancient eastern cities. Its southeastern portion is nearly level, but the north and north-western portions run up upon hills, with some of the streets very steep. Mules or asses are very numerous, and most of the country produce is brought in upon their backs. There are few fine public buildings—the Museum filled with relics from Pompei, Cumæ, and other ancient cities is very interesting. The people are largely engaged in coral fishing on the coast of Africa, and in the manufacture of this article into ornaments. Wine, brought in from the surrounding country in casks upon the backs of asses, is a large article of trade.

Nor. 6th, Evening.—We are on board a steamer waiting our passage to Marseilles in France. Mount Vesuvius has attracted much attention all this day. We were walking upon its peaceful sides on Saturday last, and gathered specimens of lava. But after five years of slumber, it this very morning commenced sending up heavy volumes of vapor, which old residents say is a prelude to an eruption of lava. I wish we could wait to see what will happen, but our arrangements are all made for the home voyage of 5500 miles, and we cannot stop. If the expected eruption takes place, you will from the above description be able to imagine its appearance. In some of the former eruptions the lava has broken forth from the sides at different points, the marks of which remain in the form of lava hills with the cooled solidified streams extending down the mountain sides, one-eighth to one-fourth mile wide and twenty to one hundred feet deep. The favorite "spouting" place, however, is in the center of the summit. The melted stone boils up and runs down the sides in one or more streams, sometimes cooling before it reaches the bottom, and at others flowing down to the foot, and into the Bay when flowing westward, burying houses and villages that lie in its course. At frequent intervals during the overflows immense masses of melted matter and flames belch forth and shoot high into the air where the lava is cooled in light porous form, and driven by the winds falls in showers of ashes and rapilli, often two or three miles distant from the summit, as when Pompei was buried. I omitted to say that Vesuvius has a twin mountain peak just east of and partly joined to it, called Monte Somma. This was an ancient volcano doubtless, but has been quiet, I believe, during the period embraced in modern history...."

[By telegraph, and by the recent newspapers, we learn that the activity of Vesuvius, referred to in Mr. Judd's letter, proved to be a real eruption. The melted lava has for several days flowed down the mountain sides in six or seven different streams. We have not heard of any extensive damage done to the neighboring cities as yet.—Eds.]

Brail Farming.

It is to be lamented that so much of our farming is mainly a matter of muscle. The routine farmer uses about as little mind in the cultivation of his fields as the ox that he drives. His team always goes in the ruts made by his fathers. He has no well-devised system embracing many years of improvement for his farm. His object seems to be to get through the year as

easily as possible, and get a subsistence from the soil. Now we want something better than this, and are beginning to have it. So much more productive is brain than muscle, in manipulating the soil, that we know of instances of first-rate farming by men who never put hand to the plow. It is undoubtedly more satisfactory to a man to give his whole attention to husbandry, and ordinarily this is the law of success. But so great is the need of more capital and more mind in this business, that we welcome from any quarter the men who can show us how to make farming profitable. The best cultivators that we have found in the country are men bred to other pursuits; professional men, mechanics, merchants, and bankers, diverted temporarily from their chosen pursuits to husbandry, or adding this to their other business. We have seen so many cases of eminent success in this kind of farming, that we think favorably of it, and do not hesitate to recommend it to any man who has capital and a taste for husbandry.

Men of this class generally have abundant capital, and are not afraid to invest it in this business. They bring the mental discipline and tact of the town on to the farm, and work with as much faith in the field as they once did in the shop or the counting-room. Their skill, trained in other schools, tells in the field. The shoemaker turns his attention from taps to tap roots, and turns out such crops of beets, carrots, and turnips, as are the envy of the neighborhood. The lawyer pleads his case with the soil, and wins such verdicts as he never obtained from juries. The physician medicates the barren field, and infuses into it such health and productiveness that all the old fogies wonder what sort of manure the doctor uses. The minister tills his glebe with so much skill that he brings both the butcher and grocer in debt to him at the close of the year. The banker runs a farm as skillfully as a bank, and makes it pay surer dividends.

It is not necessary that a man should live upon his farm, in order to make it pay. It is desirable that it should be near his residence, that he should see it every week, and lay out the work for the foreman. But very good farming is done even without this, if a man will give his attention to it. Washington planned his farm crops and rotations with his campaigns in the fields of war, during the dark years of the Revolution. Webster, at Washington, dictated the plan, and most of the details of his farming, at Marshfield, and that was certainly quite respectable. Professional men in villages and cities often have farms in the suburbs that they cultivate with great satisfaction and profit. Sometimes the foreman is a partner in the business, and takes the farm at halves, furnishing half the stock, tools, seed, etc., and taking half the crops. But this does not always work well. If the land-owner has liberal notions of improvement, it works quite ill; for he looks to the permanent benefit of his place, while the foreman very naturally looks for large receipts at the close of the year. The best method is for the landholder to hire a competent foreman with a family, on a salary, and if he wishes still further to stimulate his endeavors, give him a small share in the profits of the business. It should be stipulated that he should board what laborers are needed, at a given price, so that the crops may not suffer for want of working at the critical time. This will save all disputes about the application of manures, rotation, sale of crops, and other details. With a good foreman capable of directing labor, a man of capital in the village or city can carry on a farm, and make

it pay. But he will not find it a sinecure. If his time is already fully occupied, or if he is averse to the business, he should not attempt it. But if he has a taste in that direction, and is willing to plan, and labor with his brain, he can find a great deal of pleasure and sure profits in cultivating the soil. The amount of the dividends will depend a good deal upon the skill of the operator, the seasons, the facilities for marketing, and the contingencies which affect all other industries. Farms located near cities and villages usually rise in value, and this consideration often determines capitalists to these enterprises.

DEVICE FOR LOADING HEAVY LOGS.

Loading Heavy Logs.

In response, we suppose, to our suggestion made not long since, we have from Mr. Wm. Louden, Jefferson Co., Iowa, a description of a way of rolling heavy logs upon a sled by hand, which he has found useful. Items and hints of this kind, especially if accompanied by sketches, are always very welcome. Mr. Louden writes:

"In return for hints, I send a sketch of an apparatus which I used the past season for loading logs upon sleds. It consists of a supporting frame [properly a "gin."—Ed.] composed of three poles, *A*, *B*, *C*.—*A* and *B* are ten feet long, and may be made of 3 by 4-inch scantlings; the pole, *C*, is 16 feet long. The windlass, *D*, is 3 feet long and 7 inches in diameter, and has a 1-inch iron pin 11 inches long, driven into each end about 8 inches. The ends of the windlass are made conical, and it is fastened upon the frame by two pieces of wood, 3 inches square, and 2 feet long, spiked or bolted to the scantlings, *A* and *B*, about 4 feet from the ground, as shown in the sketch. Two 2-inch holes at right angles with each other are bored through the windlass, into which the handspikes, *S*, work loosely. A rope, *E*, is passed around two little pins in the windlass, placed so as to prevent the rope from winding over the holes for the handspikes. The ends of the rope are passed through two pulleys, *P*, then over, around, and under the log, thence back to the sled, to which they are fastened, one to each end. By turning the windlass with the handspikes, the log is rolled up the skids on to the sled. The skids, *F*, are made with a notch, so as to carry the logs clear of the fender. A log can be loaded as quickly by this arrangement as by horses, and it can be worked in many

places where horses could not. Then there is no danger in using it, for if anything should break or slip, the operator is not in the way. If a knot on the log prevents its rolling, one of the levers resting against the cross-piece *H*, will hold the log while the obstruction is removed."

Shall We Keep Up Our Flocks?

We regret the tone of despondency which pervades so many of our exchanges in regard to wool growing. Wool is down, notwithstanding the protective tariff, and it is very natural for men who have been receiving sixty cents a pound to look upon forty cents as poor pay. Some are reducing their flocks, and others are selling out entirely. A few, and we think they are the wise ones, are taking advantage of the low price of sheep to increase their flocks, and be ready for the rise which they think is sure to come. The temporary depression in the wool market should not lead flock masters to abandon their plans, and change their stock; if favorably situated for sheep husbandry, they should hold on patiently, and wait for better times. We want to see this business put upon a permanent basis, and pursued as steadily as beef or pork making. The demand for its products, mutton

and wool, is quite as steady, and as likely to increase in the future. Nothing can be more certain than that this nation will continue to wear woollen garments, and to eat mutton, and in increasing proportion as the market is better supplied with these articles. It is not strange that these products are cheaper than they were last year. Wool and mutton vary no more in price than pork and butter. A variation of twenty or thirty per cent. in these articles in the course of a year is not uncommon. But farmers ought not on that account to give up the raising of butter and pork. If they keep on steadily with the industry their farms are adapted to, they will be ready for the rise when it comes, and make money. Almost every kind of business has its periods of depression, and there is no reason why sheep husbandry should not take its turn.

Wool, we think, has about touched bottom, and farmers may look for better prices another year. There were very large importations of wool and woollen goods during the war, and the year that followed, in anticipation of the high tariff that was called for. This immense importation still affects the market. Shoddy has also been very largely used in the manufacture of woollen goods, and the unfortunates who were once taken in with this article are in a temper to cry aloud for garments made of the last clip, fresh spun and woven. Pantaloon makers that do not last out half their days are not the article to make sheep look amiable in the eyes of the public. Shoddy, we trust, has had its day, and is bound to the compost heap, where old woollen garments should bring up. Another hindrance in the way of wool growing, the dogs, is likely to be removed very soon. Several of the States have efficient dog laws, and the sheep killing

cars are greatly reduced. All that is wanted now, is a steady policy on the part of flock masters, and concert of action, to secure a national dog tax, and to put wool growing on as firm a basis as it has in England. The introduction of the middle and long wool sheep has greatly increased the consumption of mutton among us, and these animals are so well appreciated that we shall have to raise them, if we get pay for their flesh only. Though the present price of mutton is low, it cannot be a very bad business to raise South Downs and Cotswolds, at the prices they bring. We say then to the flock masters who are planning for the future, do not be in haste to abandon sheep husbandry. The flocks are steadily enriching your pastures, and if you hold on steadily, they will enrich you.

CROPPING THE AFTERMATH.—It is claimed for this practice that all the manure made from the grass is returned to the field, and the old stubble is kept out of the way of the next year's mowing. In a recent conversation with a very successful farmer in Connecticut, he branded it as a ruinous practice. For twenty years or more he had kept all cattle from his meadows after they were mowed. The grass makes a thick covering for the roots in winter, so that they are not injured by the frost. It starts earlier in the spring, and even if the season happens to be dry, there is a fair crop of hay. The decaying old grass is a good mulch, and eventually a fertilizer. The hard cropped meadow in a dry season is generally a failure. He keeps up his fields to two tons of hay or more to the acre, and is satisfied with one crop. He top-dresses with muck compost and seaweed, and sells hay, though he keeps a dairy farm.

Post-Hole Borers.

We have inquiries about these implements by those who are anxious to relieve themselves of severe hand labor by the use of convenient tools, so far as possible. The implement is of the form we figure it,

POST-HOLE AUGER.

with the auger. The bit consists of two blades having flanges on the outer edges, and set spirally like the thread of a screw. This is no new invention, but has long been in use. Most agricultural stores keep these articles, but there has never been a very extensive sale for them.

Domestication and Crossing of the Buffalo.

It seems a matter of regret that after the probable, or to say the least, possible value of the buffalo and of the buffalo cross in agriculture had been demonstrated, as it long since was, there should have been no systematic efforts made for its extensive introduction, or general breeding and testing. The fact is, however, the value of the buffalo has never had sufficient demonstration, and they have been sufficiently domesticated in but a single instance, so far as we are aware, to enable any one to judge well of their excellences. Mr. Robert Wickliffe, of Lexington, Kentucky, some 40 years ago obtained from crossing a buffalo bull with common cows, several half-blood cows

and steers,—as we infer from his rather indefinite letter to Audubon, which constitutes the chief part of American literature on this subject. The cows he bred to common bulls, and to the buffalo bull, and after obtaining a fine three-quarter-buffalo bull, bred the cows of the herd chiefly to him for many years. The results of Mr. Wickliffe's experiments seem to be that the buffalo is capable of thorough domestication; that the half and quarter-blood steers and cows are larger than either parent; that they fat

readily, make excellent beef, are very hardy and longlived; that the oxen are admirably adapted to the yoke, having immense strength combined with great activity. He never tested the milk, and judged of the milking qualities of the cows only from the fact that when the cows and calves ran in the same pastures with common cows with their calves, the grade-buffalo calves were always the fattest. Audubon mentions that at the frontier forts, where buffalo calves were often brought in and reared, one calf was said to require the milk of two common cows. The inference drawn was that though she has a small udder, the buffalo cow must give a great deal of milk,—which, as we shall see, was probably incorrect.

It appears also that the domestic bull can not be used with the buffalo cow. Mr. Wickliffe supposes that the male half-breeds are infertile, which we doubt. The females, on the contrary, are fertile crossed with the bulls of either race.

The prevalent colors in this herd were dark, but occasionally white occurred, especially upon the head, and sometimes also striped or brindled animals, on which the dark color of the buffalo blended with a light dun, "like the stripes of a zebra." Here our knowledge of the buffalo

lad of fourteen to lead and handle her, and stands to be milked as well as any cow in the fine herd belonging to her owner. The hump is greatly reduced from that of a full-blood buffalo, as the reader will see by comparing this engraving with that on the first page of the

September number.

The face is dishing, the eyebrows prominent, and the nose has a tendency to the Roman curve. The height of the spinal processes is such that the sides are what we would call in an ox "slab-sided;" still we think the ribs must spring out pretty well, and the flatness be due to the spine. The tail is peculiar, being longer than that of the buffalo, very tapering, and terminated by a pointed tuft. Mr. Swain has carefully tested the milk in comparison with that of his choicest Jerseys, and finds

that, though the quantity is small, (being probably about ten quarts per day when fresh,) it is, however, astonishingly rich, yielding fully 27 per cent. of cream, while the best of the Jerseys only marked 25 per cent. A peculiarity of this cream is that, though perfectly distinct, it is almost colorless, that is, white, like the milk. The milk is much sweeter than that of common cows, contains little water, and when it curdles makes a remarkably tenacious curd, having not more than half the usual amount of whey.

These are exceedingly valuable facts, and suggest a problem which we hope will be thoroughly worked out, as it may easily be done by some of the gentlemen farmers of Westchester County:—What would be the result of a small admixture of this blood with our common cows, bred in for several generations?

Mr. Swain is a fancier of the dark Jerseys, and has several black ones. He sees so strong a resemblance between the Jerseys and a quarter-breed buffalo heifer, fig. 2, which he has, the calf of the half-breed cow by a common bull, that he asks: "Is it not possible that the striking peculiarities of the Jersey may be due to an admixture of buffalo blood a long time ago?" This might easily have occurred, for buffaloes were taken to Europe many years ago, and, besides, the Bison of Europe is a closely allied animal, and was once not rare as at present. The heifer, now about 20 months old, has lost the hump almost altogether. It has

Fig. 1.—HALF-BUFFALO COW.

cross-breeds has rested for a quarter of a century, and we are the more happy to contribute a little to it which we think is new and important.

Mr. James P. Swain, of Bronxville, has had for some time in his possession a half-buffalo cow, (fig. 1), which is supposed to be now about five years old. She is of very large size, weighing 1,330 pounds, in medium flesh, massive in the fore quarters, light behind, heavy in the head and horns, but not coarse in any respect. The legs are long and bony, but move

Fig. 2.—QUARTER-BREED HEIFER.

with great precision and grace, such as few cows have. She is of a dark brown or black walnut color, almost black, the coat being somewhat woolly. She is an exceedingly powerful animal, will leap over ordinary fences, and even stone walls, with the most nonchalant ease, and mill ponds and rapid streams present not the least impediment to her. She is, however, exceedingly domestic in her nature, will allow a

a delicate head, with the large, deer-like eye, and mealy muzzle of the Jersey. The legs are very delicate though long, and almost any one after seeing the black Jerseys would take this for another of them.

Walks and Talks on the Farm.—No. 49.

"You farmers," said a city friend, "ought to be making money, with butter at 40 cents a pound. But you grumble just the same."

"American farmers seldom grumble. Those who think so get the idea from books or from tradition. It is an English habit—not an American. There is a reason for the difference. The English farmer rents his land, and grumbles in order that the landlord may not think he is making too much money, and increase his rent. The American farmer owns his land, and if anything, is inclined to exaggerate its quality and productiveness."

"I thought they were always grumbling."

"I know you did, but it is a mistake. The city people are the grumblers."

"Have we no cause to complain of high prices?"

"Wheat is perhaps 25 cents a bushel too high, and barley 25 cents too low. Butter should be a few cents lower, and pork and mutton a few cents higher. At such prices, a farmer, if equally intelligent, might make almost as good a living as a grocer or a dry goods merchant."

"Farmers used to be glad to sell at half what they get now."

"True, but this only proves that 'times have changed.' Perhaps they got too little. They have worked hard, and done their full share in making the country what it is. They are going to do still greater things. They have now hold of the long end of the lever. They are bound to make this country the grandest and noblest that the sun ever shone upon. You are all very well in your way. We could not get along without you. But we propose to have some of you take a back seat, and make room for a few of our bright, active, young farmers. City people shall no longer sneer at country folks."

As I was leaving, he said something to the effect that city people did not sneer at the farmers. And in this he is right, so far as the well-bred, intelligent citizens are concerned, but the snobs speak of us with a superciliousness that is trying to the flesh.

But enough of this. Good farmers are now making money, and are well able to educate their children. They are doing so; and it is no disrespect to the fathers to say that their sons who stick to farming, will occupy a higher social position than has been accorded to us.

It does me good to talk to an educated young farmer. But deliver me from your ignorant, prejudiced, conceited, self-satisfied, swaggering biped—half farmer, half peddler, who thinks about nothing but his own shrewdness and his neighbor's follies. Such men ought not to annoy me, but they do. Unfortunately these meddling farmers have a notion that I came into the country to "show them how to farm," and though this is in no sense true, I encounter their bitterest opposition. This is no new thing. I was reading, the other day, in the *Museum Rusticum et Commerciale*, published in London in 1763, a letter from a farmer who had been trying JETHRO TULL's system of enriching the land by hoeing. He says: "By introducing the drill plow and the horse-hoe, I could save a great deal of labor; and I may probably some time or other attempt it; but at the same time, I am sensible I shall find great difficulty in getting

men that will even try to do the work with those instruments. * * * If by dint of authority you oblige them to go out of their way, they will rather contribute to the loss of your crop, than not to endeavor to convince you that they are in the right." On this, the editor remarks in a foot note: "Our correspondent's reasonings on this head are very just. He seems to speak feelingly, and we are sorry to say that others lie under the difficulties he mentions. What chiefly prevents a reformation among our laborers in husbandry, is the *masters in general being but little more enlightened*." Not every agricultural editor would have pluck enough to utter such a truth in the first number of his paper.

I am offered \$12 a ton for all my wheat straw, to make paper. I do not like to sell straw, but I am satisfied that there is no way in which I can turn it into so much money. If we reckon the manure from a ton of straw worth \$3, I should still have to get \$9 a ton of *nutriment* out of the straw to make it pay. I do not think it is in the straw, and consequently it cannot be got out of it. If a farmer could sell his straw, and buy clover hay at something near the same price, he had better let the paper men have it.

I am more and more convinced that our chief aim should be to raise large crops of clover. The *Agriculturist*, last month, in "Hints about Work," says that the manure of "fattening hogs is very rich." This is true. It is far richer than sheep or cow manure from animals having nothing but straw or corn stalks. But if a cow, or a sheep, or a horse, is fed on clover hay, the manure from a ton of it is worth as much, if not more, than the hog manure made from a ton of corn, fed either whole or ground, raw or cooked. The idea that pig manure is so rich arises from the fact that our cow and sheep manure is usually so miserably poor. The question as to which is the richer manure, that from working animals or fattening animals, may be interesting to the physiologist, but has no sort of practical value to the farmer. If I have 30 tons of straw, 50 tons of corn stalks, 40 tons of hay, 2 tons of bean straw, 1000 bushels of corn, and 10 tons of oil-cake to feed out on the farm during the next six months, it will make no appreciable difference in the value of the manure to what kind or class of animals I feed it.

The only question I have to determine is in what way I can get the most money from the nutriment there is in the food. If we can get the most money by fattening sheep, or by keeping store sheep, or by fattening steers or farrow cows, or by feeding young stock, or from milk cows, or from wintering horses, we need not take into account the value of the manure. It will be approximately the same in either case. It will probably be the least valuable from the milk cows, and the most valuable from the store stock. But the difference is hardly worth considering, and it is a pity that scientific agricultural writers should so frequently allude to it. It only helps to keep alive the old notion that "horse manure," or "pig manure," or "sheep manure," or "cow manure," gets its value from the animal, and not from the food.

"How about hen manure?" The same principle holds. Its value is determined by the food. A bushel of corn fed to a turkey will give manure worth no more than a bushel of corn fed to a pig—provided the liquid and solids of the latter are all saved. As ordinarily managed, however, the liquid either runs away or soaks through the crevices of the planks into

the ground, and is lost. In the case of poultry, there is no liquid excrement to run away, and this is the reason why the droppings are considered so valuable. Poultry also eat a good deal of animal food in some form or another, and this, of course, adds to the value of the manure. It is a fact—and I wish every farmer fully comprehended it—that the value of manure from any animal depends *entirely on the food*.

There is one aspect of the manure question which encourages me very much—the wonderful effect that good manure has on our crops. I do not know whether to attribute this to the climate or to the soil. But I am much mistaken if the same amount of manure will do as much good in England as it will here.

We fed our hogs corn meal, and more or less oil-cake meal, (cooked,) all summer, and the neighbors evidently thought I was slightly deranged, if not more. Some said the pigs were so fat they would not grow; others, that the pork would cost me 25 cents a pound. Of course, none of us have made anything on pigs this season. The price of grain is out of all proportion to the price of pork. But I have done as well as my neighbors. In fact, I have done better, for I have lost less than they have. One of my neighbors has a dozen or fifteen pigs over a year old, and about the first of November he got out of pork, and bought one of the smallest of my late spring pigs. It weighed 145 pounds, after eating its breakfast, and dressed 121 pounds. He said he had not a hog that was fit to kill, even for fresh pork, and none, if killed, that would dress much more than half what this little chuck of a pig weighed. He was half Essex, and my neighbor said, when he came to pay me for him, that he "never saw or tasted fatter pork." I had another pig, half Suffolk and quarter Yorkshire, not fourteen months old, that dressed 423 pounds. He was the poorest pig in the litter, and did not do well for four or five months, or I should have sold him earlier.

The Deacon says there are a great many pigs, over a year old, that, at the present price of corn, will cost more to make them fat than they will bring when killed. In other words, their keep for over a year is wholly lost. Perhaps this is an exaggeration, but it is very certain that it has been an expensive business feeding their hogs the past autumn. I believe the system is all wrong.

Mr. J. H. Foster, Jr., of New Jersey, writes: "In one of your 'Walks and Talks,' in the *Agriculturist*, you say: 'A farmer can afford to pay one cent per pound for flesh as a manure.'"

"We can buy dried meat at 2 cents to 2½ cents per pound. I believe, it contains no more water than old wheat, if as much; no grease; sometimes as much, perhaps, as 5 per cent of bones—generally but little. It is considerable trouble to prepare it for feeding. I boil at one time, after it is chopped, (which is considerable work,) about 60 pounds. The chopping and boiling costs 40 cents. These 60 pounds furnish enough for five hogs for two days—all they will eat. They weigh about 250 pounds each. The cost of food, chopping and boiling, is 17½ cents per hog each day."

"How much ought the pigs to gain, and how much is the manure worth from 100 pounds of such food? Also, how much from 100 pounds of boiled corn meal? It costs me 20 per cent more to feed all they want of boiled corn meal or pudding."

I do not know, but I think one pound of this dried meat contains the substance of 4 lbs. of

flesh. If this be true, it is, when ready boiled, on a par with fresh meat at $\frac{3}{4}$ cent per pound.

I do not know what this "dried meat" is, but suppose it to be the refuse of some manufactory for making oil from fish or other animal matter. Now, the value of such an article for food would depend a good deal on how much oil there was left in it. If it contains "no grease" it will not fatten a pig rapidly, when fed alone. It would probably be more valuable for young, growing pigs, but in either case, some other food, such as corn meal, should be fed in conjunction with it.

The only experiments I can recollect that bear on the point are those made by Lawes & Gilbert. These experiments were made on 93 pigs, three and four pigs in each pen fed with different foods. Dried Newfoundland codfish was one of the foods used—not alone, but in conjunction with corn meal, barley meal and bran. When put up to fatten, the pigs weighed about 160 pounds each, and were, to the best of my recollection, nine or ten months old. They were fattened eight weeks. I cannot go into details. Those who wish for a further account of these interesting experiments will find it in the Rural Annual for 1865, pages 30-38. One pen of four pigs had about 2 pounds of codfish (boiled) each per day, and all the Indian corn meal they would eat.

The four pigs, in 8 weeks, eat 308 pounds of codfish, and 1,450 lbs. of corn meal, and gained 339 pounds. Or, in other words, each pig consumed on the average $9\frac{1}{2}$ pounds of codfish and 45 pounds of meal per week, and gained a little over 12 pounds. One hundred pounds of food produced a little over 22 pounds of pork.

In another experiment, where 2 pounds of a mixture of "bean and lentil meal," (say *pea* meal), were given each pig per day, and all the Indian corn meal they would eat was added, it took 100 pounds of the food to produce $21\frac{1}{2}$ pounds of pork. These experiments would seem to indicate, therefore, that dried codfish is not more fattening than peas.

This dried codfish contained about 40 per cent. of water, $18\frac{1}{2}$ per cent. of ash, 6 $\frac{1}{2}$ per cent. of nitrogen, and not quite 1 per cent. of fat. The beans and lentils contained about 5 per cent. of nitrogen, and about 2 per cent. of fat.

Assuming that Mr. Foster's meat has the same composition as the codfish, it is easy to give a rough estimate of the value of the manure obtained from pigs consuming it. Genuine Peruvian guano, all things considered, is the cheapest ammoniacal manure in market. It is worth, say \$90 per ton, and contains 15 per cent. of ammonia.

Assuming that one pound of nitrogen in the food will give us one pound of ammonia in the manure, (which is allowing for much more loss of nitrogen than is retained in the animal), 100 pounds of the meat fed to a pig would give 6 $\frac{1}{2}$ pounds of ammonia in the manure. The other constituents would be more abundant in the manure than in the guano; and we shall not be far wrong if we assume that the manure from 100 pounds of this meat is worth as much as 50 pounds of Peruvian guano—that is to say, \$2.25, or $2\frac{1}{4}$ cents per pound. The manure is worth as much as the first cost of the food.

In a postscript Mr. F. adds: "One of my neighbors *thinks* it would pay to use it as manure, but that hog feeding has not paid him. I tell him we had better pass it through the hog first. He seems to think it loses more than the value of the pork gained."

There *need* be no more loss than I have as-

sumed. But unless you have considerable litter, dried muck, leaves, or other absorbent, the probabilities are that a good deal of the manure runs to waste. If this loss is avoided, you have simply to determine how much the pigs gain, and the price of the pork; and, on the other hand, the cost of cooking and feeding, and the increased labor of drawing out the manure. It is doubtless in far better condition for the crops than if applied directly as a manure.

On the same basis, the manure from 100 lbs. of corn meal is worth about 70 cents.

Mutton, it seems, has been sold in New York by the carcass for 2 cents and $\frac{3}{4}$ cents per pound. If the sheep weighed 45 lbs., and the pelt is worth 75 cents, and the freight has been paid on them from Ohio or Michigan, how much did they net the farmer who raised them? One can see that the farmers could not receive much for them, or else the drivers must have lost money. Shall we never learn wisdom?

A farmer in this vicinity has just sold eight head of cattle for \$150 less than the same butcher offered for them last spring. He has lost the whole summer's feed and \$150 beside. Thus we go!

One thing is encouraging. Really good beef maintains a steady price. If we raise choice animals and feed them well, we can calculate on getting a fair price for them. Last week, "inferior" beef cattle fell a cent a pound in New York, being quoted at 7c. to 8c. dressed weight; while "extra" and "choice" held their own at 16c. to 17c. per pound. Such facts as these are eloquent advocates of good breeding and high feeding.

John Johnston talked of giving up farming. He was over eighty and had no son; help scarce and not trustworthy. "Had I not better sell?" he asked. I wrote him "No." Fancy John Johnston in a city! No underdrains, no growing crops of grass and clover, no wheat, no corn, no barley, no sheep! The last time I was there, when he went into the field his favorite cows came to be patted, and a splendid heifer calf put her nose into his arms. Shall he leave them? Those who say so know nothing of the pleasures of farming.

He now writes me: "The farm is not to be sold. I have let 40 acres for five years, for nursery purposes, at a yearly rent of \$1,000, payable semi-annually. This is a great deal better for me than selling. It would have been a great trial to have left my farm. I still have over 50 acres of cleared land, and you may be sure I will do my best with it. I have sold this year's crop of wheat for over \$1,500. I have 900 bushels of ears of corn from a trifle over eleven acres, and at least 70 tons of hay. I have bought 300 wether sheep and ten tons of oil-cake to feed to them. Won't I make manure this winter for my small farm?"

If I live, I will sow 12 acres of wheat next September. The same field yielded over \$100 worth of wheat per acre in 1866. It is all 'bush' about our land failing for wheat. The failure is all for want of feeding the land. Horses and oxen must be well fed if they are to pay in work. So must the earth if it is to pay for tilling."

Twenty-five dollars an acre rent (five per cent interest, or \$500 per acre) is not bad for land that was once pronounced "the poorest farm in all creation." So much for underdraining, good tillage, liberal feeding, and high manuring.

Mr. J. says he never had so poor a crop of

clover seed as this year—not quite a bushel per acre. Mr. Foster, who is an excellent farmer, only got 13 bushels from 38 acres. Mr. J. adds: "My first crop was far too heavy. It was so badly lodged that a great deal of it could not be cut close. I never had a good crop of seed when the first crop was not shaved off clean. Clover seed will be very high in the spring, if not before."

The drouth here still continues. Many farmers have to drive their cattle miles to water. It looks now (Dec. 2,) as though winter was about to set in without rain. But it is said such a thing was never known.

WHEAT CULTURE EXTENDING AT THE SOUTH.—One of the encouraging "signs of the times" is that wheat is reported to have been much more extensively sown at the South than ever before. This is undoubtedly true of some extensive sections. There is nothing more certain to entail poverty upon the soil than continual cropping with one plant—tobacco, cotton, or corn. The introduction of a variety of crops, with a judicious rotation and systematic manuring, will develop the full resources of the soil. In this way, we are confident that wheat will be found a better paying crop than either cotton or tobacco, alone.

ASH BRNS.—More fires occur from ashes stored in wooden vessels than from almost any other cause. The favorite deposit is an old flour barrel under the shed or in the wood-house. The ashes stand perhaps in an iron vessel until they are supposed to be cool, and are then emptied. Coals, especially of the hard woods, hickory and oak, will retain their fire in ashes for a day or longer, and this, coming in contact with the barrel at a crack, kindles a flame, and a destructive fire ensues. Farm-houses and barns are frequently destroyed in this way. There are several devices for the storing of ashes. Where wood is wholly used in the fireplace, or Franklin fire grate, it is convenient to have a flue in the back part of the hearth or the chimney, communicating with an ash bin in the cellar. The mouth of the flue is kept covered with an iron slide. The bin in the cellar is made of stone, and is of sufficient capacity to hold the winter's stock of ashes. But the stove has so generally taken the place of the open fire that other contrivances are used. Some put up a small brick building expressly for the purpose, having a half door in the upper part, for convenience in emptying the ashes. Bluestone flags are convenient for making bins of smaller size, and are not very expensive. Perhaps the cheapest article for this purpose is a cement tile, two feet in diameter, covered with a piece of zinc or sheet iron. It is cheaper than iron, and fire-proof.

Wintering Stock on the Prairies.

There is every excuse to be offered for the western farmers who winter their stock on the warm sides of straw heaps and hay stacks on the prairies, for they have, in many cases, had hard work to build a comfortable shelter for their own heads. When farmers in the older settled States do the same thing, that is, expose their stock to the rigors of the winter, the cuts of satire and the lash of open reprobation are all that will bring them to their senses. For the cattle's sake we often resort to the appeal to the pocket, and this is listened to; and, though nev-

er so softly whispered, is heard above the lowings of the shivering herd. A correspondent, of Winchester, Iowa, (signing himself "Titus,") sends us a description of straw sheds, that are easily made and good for prairie farmers who have no market for their straw. He writes:

"Physiologists tell us that it is the food which animals eat that keeps up the animal heat, in the same manner that coal or wood keeps up the heat of a stove or furnace; and as a natural consequence, it would take less food to maintain the proper temperature of the body, were it kept warm by other means. This is the theory: the facts are that all kinds of stock, if sheltered

STRAW SHED FOR STOCK WITH AN L.

in cold weather, require a great deal less food to keep them in a good, thriving condition, than other stock do that are exposed to the weather. I once tried to make a calculation of how much I could save in feed by keeping my cattle sheltered; and although I did not arrive at any very definite conclusion, yet I was well satisfied that I could save more than enough to pay all the expenses of putting up warm, permanent sheds; besides avoiding all those evils that ill treatment always entails on all kinds of stock, surely and speedily impairing and even destroying the good points of any breed, however hardy.

STRAW SHEDS.—Very good temporary sheds for cattle and sheep can be made of a framework of rails or poles, and covered with straw. This will shelter stock the best by making it in the shape of an L, with the east and south sides left open. It should be so arranged that the stock can pass from the shed into the feeding yards or stalk fields whenever they choose. We, in the West, after gathering our corn, turn our cattle into the stalk fields, where they make a tolerably good living at nipping what fodder they like, and picking up rubbins of corn that were overlooked when the crop was gathered.

Prairie grass, or rather prairie hay, makes an excellent covering for a shed, as it turns the rain much better than straw does. If it is put on somewhat after the manner of thatching, it does all the better, and requires only a comparatively small amount of hay, and will turn the rain for a long time. It also makes excellent forage for cattle, and I have known whole herds here in Iowa to be wintered on nothing but prairie hay. A little grain fed out with the hay would, in my opinion, more than repay the cost of it, let the price be what it might. The stock should never get to the outside of the straw shed—I mean on the side on which the straw is piled,—for they will tramp down and waste the straw, and destroy the whole shed in a few days. Such a shed as this will answer every purpose of a better one so long as it lasts.

Farm and Lawn Roads and Highways.

There is no one thing which so marks the difference between a long settled and a new region as the roads; and yet, throughout this democratic country, where so few public expenditures can be made which do not carry with them at first sight assurance of their economy, we seldom find good ones, and it is hard to secure thoroughness in making new roads.

There are three requisites of a good road: 1st, Dryness; 2d, Firmness; 3d, Proper form. The first may be secured wherever good drainage can be had, by laying a tile drain capable

of carrying the water four feet below the middle of the road. Tiles are better than stones for drains, because if well laid and either turned aside or provided with silt basins wherever change of level decreases the rapidity of the descent occur, tiles will never fill up, while stone drains are very likely to. The tiles being covered after the most approved manner, as described in former numbers, (the joints protected by collars or otherwise, and the stiffest soil rammed down hard over the tiles), the road bed must be made. For this purpose the roadway should be nearly level, hollowing a little from each side alike toward the drain in the middle, and at least a foot below the intended surface of the road, if it is to be merely a farm or lawn road of say 20 feet in width, but deeper in proportion for broader roads and highways. This bed is laid with large stones, (flatish ones do best for small roads and carriage ways), and the surface should be only slightly crowning in the middle. Broken stones, from the size of one's fist to that of an egg, are laid upon these, and this layer is made crowning according to the usual practice, and forms a bed upon which a small amount of sharp, sandy gravel soon makes a smooth, hard road, if well rolled.

The usual custom is to have a ditch or gutter at each side of the road. This in the case of

SECTION OF ROAD.

carriage ways and park roads bounds the grass and keeps it from encroaching upon the gravel. The result is that either the earth washes away, and an irregular surface ditch is formed, or the flow of water is stopped by gravel washed from the road. We present in the accompanying engraving a plan recently brought to our notice, which offers two advantages above the common practice, and though applied, so far as we know, exclusively to park roads, is equally applicable to others of sufficient width for two wagons to pass conveniently. The differences between this and other well made roads are solely in the shape and in the arrangement of the surface.

It will be observed (see figure,) that the section of the surface instead of being *crowning* is *angular*, the angle being in the middle like a very flat roof of a house. The use of this form is, that the road may be made much flatter than otherwise, and it gives a tendency to drive equally on both sides and not exclusively in the

middle; besides rain falling flows off more freely and completely. The gutters are made as usual at the sides where the road bed ends, stoned if necessary to prevent washing, but the grass is allowed to cross them, and come up some two or three feet upon the gravel, where it is trimmed to a uniform edge. The advantage of this arrangement is that, while the water from the road quickly finds its way through this strip of grass to the gutters, it does not carry the sand with it and does not wash away the sides of the road. It is a bad plan to allow large quantities of water to flow close by the side of a road, unless the channel is broad and well walled and paved. In case of freshets damage is often done.

GAS-HOUSE LIME.—This article has the effect of lime in but a slight degree. After it has been weathered, it consists to a great extent of gypsum, (plaster.) Its effects upon the soil are to supply lime to the plant where this ingredient is wanting, (which on common soils rarely occurs,) to supply sulphur and sulphuric acid, and to produce that series of obscure, yet beneficial effects which plaster does,—all of which plaster will do equally well or better, but not so cheaply. The weathered gas lime often contains small quantities of lime remaining long in the condition or slaked lime. This is considerably abundant when the article is fresh, and then it acts with good effect in vegetable compost heaps, upon muck, etc. If applied to the soil in this fresh state, and, during the growing season, placed upon the soil where crops will be affected, the results are uniformly disastrous, not owing to the lime, but to various combinations of sulphur with lime, which, after some months' exposure, become converted into the sulphate of lime, or gypsum above alluded to.

Draining in Winter—Draining Tools.

Tile draining may often be done in winter better than at any other season, especially where the ground rarely freezes very deep. A large body of snow falling early will often prevent the frost getting into the soil, and one will often be surprised to see how a few strokes of a sharp, heavy pick will crack up the frozen crust. Of course the ditches must be dug, the tiles laid, and all filled and finished as rapidly as possible, lest it be filled prematurely with snow and ice. As protection against this occurrence and to prevent the ditch and earth freezing on a cold night, straw may be laid across the ditch and upon the heap, being kept in place by poles or pea brush. At other seasons tolerably good work may be done with common tools, but in winter the very best are most economical. There is pressing necessity to move as little earth as possible, and yet to get down to the full depth, (4 feet usually). Our Western readers frequently inquire about draining tools, and doubtless would very often order them were they advertised. For their information we would state that every first-class agricultural store that we know of either keeps them on hand or will procure them if ordered,

Clear the Water Courses!

There is hardly a county of which we have any knowledge in which there are not some sluggish streams whose flow is hindered and rendered slow almost to stagnation, at least in certain spots along their course, by unnecessary

obstructions, drift wood, logs, fence rails, reeds and sedges, etc., or by a very circuitous course. The result of this sluggishness is that the swamps are more extensive than they need to be, the water sets back, into the plowed land even, thorough drainage is impossible, miasms rise from those swamps which retain their water into the warm weather, farming operations are put back or rendered futile, crops are poor, and fever and ague, typhoid and intermittent fevers prevail, men are short-lived, and their children have enfeebled constitutions. It is easy to deplore this state of things. It requires action to put an end to it, and this might, to a degree, be done in most States almost as easily as to get a railroad charter, if any one energetic man would give to it a little time and labor.

It is obvious that where farms are small, or especially where the country is very flat and the streams are all sluggish, individual proprietors can do but little. Co-operation is required, and this must be continual; for, after swamps are reclaimed, fields drained, health and prosperity introduced, all must not relapse into the former dank, boggy, miasmatic state, because the streams are allowed to become again obstructed. Acts of legislation will probably be requisite to secure proper attention to the subject, but soon it might be with the water courses much as it is with highways. Every township or county is responsible for its own roads, and for affording facilities for travel into and through its territory.

Mr. James E. Rankin, of Detroit, directs our attention to the annoyances and losses suffered by the people of many parts of Michigan, and suggests that the duty of keeping the water courses clear might be added to those of the highway commissioners without making their labors too onerous. If this could not be done, county water commissioners might be appointed, or elected, to secure the desirable ends suggested, in accordance with law. In the older States, at least, relief, to a certain extent, may ordinarily be obtained through the road surveyors, or highway commissioners, and town officers, a regular hearing being had; but the decisions in these cases are usually based on what the former condition of the streams has been, not having a view to the improvement of the county and to the benefit of the community. The common law allows a landholder or tenant, under certain restrictions, to secure drainage for himself; but a law is really needed to check disease, to improve the country, and to benefit agriculture. Let the legislatures require proprietors to keep the water courses clear.

American Farm-House Plans.

So far as we now recollect, we have never seen a good plan for an American farm-house. We demand a great deal. Our farmers are ambitious for themselves and their children. They are workers, individually and collectively. The whole family work for a living, and glory in it. They are the substantial middle class, with good incomes, free, independent, hospitable, intelligent, and cultivated. They are the aristocracy and gentry of our land, educated, refined, practical, sensible; having the confidence of neighbors, townsmen, and fellow-citizens, they are our Senators, Representatives, and Governors. The house and home of the farmer must therefore combine in itself features which are necessities for the laboring man, conveniences and accommodations for the well-to-do yeoman, with his cultivated mind and free hospitality, and more or less of the luxuries which distin-

guish the homes of the "gentry" of other lands. We present herewith a plan of the ground floor and second story of the dwelling of a farmer of abundant means, and propose at some time to show also how its main advantages may be attained in much smaller and cheaper houses.

The plan is of a house 36 x 50 feet, (not allowing for the walls, which would vary according to

Fig. 1.—FIRST FLOOR.

the material, wood, brick, or stone, of which the house may be built,) with an extension 28 x 46 feet. It is intended to front east or south. In the middle of the ground floor is the large hall or sitting-room, with which the other rooms directly or indirectly communicate. This is a room 16 x 20 feet; at the rear of it is a back entry, 8 feet clear, with a staircase at one side, which rises by 11 easy steps to a platform over the back door, and thence by 5 steps to the second floor. This arrangement precludes the necessity for back or servants' stairs, for thus the only staircase is shut off from the rest of the house, yet perfectly accessible. On either side of the hall, doors, which may be either single or double, open into the dining-room (D) on the right, and the parlor (P) on the left. Connected with the parlor, and opening into the back entry, is a large room (B) which most farmers would make their own bedroom. It has a good-sized, light dressing-room, and two liberal closets, one opening into the dressing-room. This room would make a very pleasant library, with an alcove (the dressing-room) for retiring for quiet study or writing. Should it be used as a bedroom, some of the other rooms would become of necessity the place for books, and book-cases would adorn the hall, the parlor, or the dining-room, according to the taste of the occupants, the uses to which the rooms are put, the size of the family, number and age of the children, etc. The kitchen (K) communicates with the dining-room by a short passage way, and is cut

the mistress keeps the key; and it has a fine large pot-closet near the chimney. The kitchen is large, being 16 x 18 feet, and may be used as a dining-room, if that style of living is preferred. The china-closet is spacious, 4 ft. x 4, which is large enough for any ordinary family.

The back door opens upon a 10-foot piazza, crossing the west side of the house, having a door into the shed on the north. This shed is 16 x 28 feet, with a paved floor, and double doors at either end, so that a wagon may pass in or through, leaving or taking a load. The

cellar steps come up near the kitchen door. Across the shed from the kitchen is the dairy, on the west, and the wash-room on the east side of the L. Still further in the rear, on the west side, is the ice-house, with a cool-closet, and on the east, a store-room, staircase, and privies. This L may of course be indefinitely lengthened, and made to connect with the woodshed, carriage-house, horse-barn, etc.; but we think it well not to maintain too intimate a connection with such buildings; the danger from fire is greatly increased and no adequate convenience gained. The shed is large enough to contain a three months' supply of wood, or even a winter's supply, if desirable; a large closet for keeping utensils, tools, etc., in frequent use about the house; a stove and table, when the shed is used as a summer kitchen; besides furnishing protection from the weather at all seasons. We do not recognise the desirableness of making such a shed a wood-house, as is frequently done, for it is much more convenient for other purposes, considering its use at different seasons. However, should this be demanded, we have only to put the dairy and wash-room next the kitchen, with a cellar under them, and to use the wash-room for a back kitchen. Then the shed, located next beyond, may be made a wood-house; but its great convenience as a place to do many kinds of work which would otherwise have to be done in the kitchen or outdoors, would be lost.

The second story plan is worthy of notice, for, though very simple, it is arranged for the special convenience of the housekeeper and servants. All the rooms have spacious closets; two have dressing-rooms. There is a large linen-closet, and a bath-room, opening into the central upper hall, into which the stairs rise, and which is itself abundantly lighted by the large staircase window. A passage from the hall to the second floor of the L connects with the servants' bedrooms, (S, B, R.) which may be shut off from the main part. The second story of the L is represented as low, and lighted by dormer windows on the sides. Additional expense would raise the roof and make this floor much more spacious.

If a range, or stove, with a water-back be set in the kitchen, nothing is more simple and safe than an arrangement for having an abundance of hot water on the second floor by pumping; and, if a head of water can be controlled, hot and cold water may easily be conveyed to every room in the house, which is the perfection of water arrangements. We know that multitudes of our most respected readers enjoy their wash at

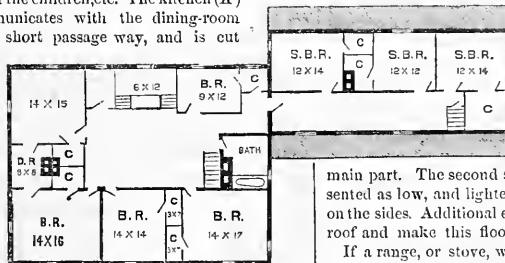

Fig. 2.—CHAMBER FLOOR.

off from it by two doors, which would generally prevent the noises and odors of the culinary department being especially observable. This room has two windows, a door into the back entry, one into the shed, and one down cellar. Into it opens the 8 x 8 store-room, of which

the well every morning so heartily that the idea of hot and cold water flowing in unlimited abundance in their bedrooms seems like the height of effeminate luxury. But affording as it does the opportunity of frequent and thorough ablutions, we esteem it as a most desirable feature in any dwelling. At any rate, we would have water, hot and cold, at some point on the second floor, and the bath-room is the most appropriate place.

The second floor may be a full story, say 8 feet in height from floor to ceiling, or the roof may be low, and part of the ceiling close to the roof be made sloping. This depends upon the style of the building, whether it be two full stories, or what is called a story and a half in height. The plan answers equally well for both. In either case there should be a good loft or garret. This is not inconsistent with a house in the cottage style, especially if the gambrel roof be employed. This is coming of late into fashion, as it was 50 to 100 years ago, and has at least the advantages of giving high, roomy garrets, and a picturesque appearance.

Dispense with the "Big Beam" in Barns.

The framing of old-fashioned barns was not done with especial reference to convenience in unloading hay by horse-power. Common mechanics now possess superior knowledge of bracing and strength of materials to that of our fathers, and architects of ability have applied

SECTION OF BARN FRAME.

themselves to flinding out cheap and strong ways of putting up wooden structures. The result is that our wooden buildings are not only better framed, but stronger than the heavily timbered ones of 50 to 100 years ago. The old barns, however, still stand, and, for aught we see, their period of usefulness may not cease for 100 years more. Where timber is abundant the old plan of framing is still followed quite extensively. There are several ways of doing away with the "great beam" in new barns; it is, however, more difficult to take the beams out of barns in which they were originally placed. In using the simple horse hay-fork each "grip" must be dragged over these beams, while otherwise the hay might be simply pitched off, or swung directly from the load to the mow.

Mr. Walter Moore, of Orange Co., sends us the description of a plan which he saw carried out in a barn of John Larkin, in Livingston Co., Mich., which is shown in the accompanying sketch. This represents a single "bent," or piece of cross framing, with the big beam out, and the purlin posts extended to the sill. In the cut, *A* represents the sill; *B*, the posts; *C*, the purlin posts; *D*, the tie beam between the purlin plates; *E*, dotted lines showing where the big beam would be; *e*, *e*, beams and braces in place of the big beam, to stay the purlin posts; *F*,

the centre post; *H* is the breast girt on each side of the thrashing floor. The plan strikes us as likely to be useful in many cases, and not of necessity weakening the structure, which it would do were the work carelessly done.

Apiarian Progress.

A member of that enterprising firm of apiarists, Bidwell Bros., St. Paul, Minn., in making an extensive tour among the bee-keepers of the United States, arrived at some very interesting practical and theoretical results which he communicated to the readers of the *Agriculturist*.

"During July, Aug., and Sept. last, we visited

12	Apiaries in Minnesota, containing 1,088 Colonies.
8	" Iowa, " 531 "
5	" " Missouri, " 623 "
6	" " Illinois, " 207 "
4	" " Indiana, " 49 "
12	" " Ohio, " 841 "
3	" " Kentucky, " 10 "
6	" " Tennessee, " 172 "
6	" " Georgia, " 31 "
2	" " Florida, " 14 "
1	" " Rhode Island, " 6 "
5	" " Connecticut, " 37 "
3	" " Massachusetts, " 78 "
14	" " New York, " 1,004 "
2	" " Canada, " 12 "
6	" " Michigan, " 74 "
8	" " Wisconsin, " 507 "
In all	5,373 "
103	" " 16 States and Canada.

(This shows an average of over 52 stocks to each apiary.)

We found movable comb frame hives exclusively in 22 apiaries; used in part in 64; other patent hives in 11; common board hives alone in 6 apiaries. We found 4,241 frame hives to 998 box, and 120 worthless patent hives. This substitution of movable comb hives for the old-fashioned box hives during the last several years, we consider the most important step in the advancement of profitable bee culture. We found fourteen different kinds of frame hives in use, seven of them of different patents.

The next most important step has been the cultivation of flowers for bee pasturage. We found only six apiaries where natural forage was abundant throughout the season, and this was in small apiaries in isolated districts. Adjacent to 32 apiaries flowers were sown to cover deficiencies, and these were by far the most successful apiaries we visited, making nearly double the surplus honey compared with the others taken as a whole. Some serious mistakes were made by a few bee-keepers in the kind of flowers and manner of cultivating them. In two apiaries the honey resources were so deficient that feeding was resorted to annually. In fourteen apiaries flowers were so few that the owners declared their bees were neither prosperous nor profitable. Were this branch of bee culture properly understood the yield of surplus honey might be increased several hundred fold.

In 63 apiaries forced swarming was resorted to, and in only three of these were natural queens used, the remaining 40 relying on natural swarming. Natural queens with forced swarms have been the most reliable. Nowhere did we find the miller worm of any serious inconvenience except in the two apiaries where feeding was necessary; six bee-keepers had never seen one. In three apiaries we found foul brood in a mild form and easily controlled.

In 78 apiaries so-called Italian bees had been introduced. In no apiary did we find Italian bees exclusively. In no two apiaries did we find Italian bees alike; neither in any two stocks in the same apiary, nor in any one hive were the bees all alike, allowing for the difference in color, size, and shape, in bees of different

ages. Ninety-four queens, better than the average, were shown us in ten different apiaries, in six different States, no two of which, as we judge, were alike. Twenty-six of these had the visible stripes of a recent mixture of black blood, and only two queens that we saw were of a bright yellow color, and one of these had evidently mated a black drone. In no apiary did we see or hear of a well marked drone, nor any one where the queens were known to have been mated even to their best drones. Apiarists are most deficient in careful breeding.

We saw ten imported queens, all unlike. If such a confusion in size, shape, and color, is consistent with purity, as claimed by many, it is no such purity as we recognize. We have spent three seasons in efforts to perfect Italian bees and have succeeded in rearing workers, drones, and queens, all alike, and handsome, by carefully selecting and mating the best, but we had to breed all the brown off from the abdomen of the queen, and bring three entire yellow bands on the drones. Unfortunately a long cold spell last winter took the color off from our bees and left us worse than where we commenced, compelling us to adopt these conclusions: 1st, that Italian bees are a cross between (probably) two varieties of bees; and 2d, that they are liable to deteriorate in our climate."

Little Things in Farming.

The whole success of a farmer hinges upon timely attention to little things. This, mainly, makes the difference between thrift and poverty. The philosophy of success is expressed in that old adage, "For want of a nail a shoe was lost, for want of a shoe a horse was lost, for want of a horse a man was lost." It is a little thing to keep accounts of the pecuniary transactions upon the farm. A half hour Saturday evening would enable most farmers to know just how they stand with the world. Yet, we suspect half of the men who cultivate the soil never make an entry in a book, and for want of this, the account runs up fearfully at the store, and many articles of luxury are purchased for which they are unable to pay at the end of the year. Debt accumulates, the farm is mortgaged, and finally lost, for want of a little paper and ink. It is a little thing to put up a tool in its place when not in use. Yet many have no tool-house, or place of shelter for any implement or vehicle. Things are left where they were last used, the plow in the field, the cart in the yard, the chains in the stable, the harness in the wood-house, the axe at the wood-pile, and the rakes in the corn crib. Many do not even house the expensive implements they have bought, and reapers and thrashers are treated like old plows and harrows. The parts made of iron and steel grow rusty, and the wood decays. A machine that is good for thirty years with proper care is used up in five by abuse. It is a very little thing to turn a nut when it is loose. Yet for want of the tightening the nut is lost, the bolt comes out, and the loaded wagon breaks down on the way to market, and a whole day for man and team is lost. It is a little thing to keep a horse properly groomed, yet for want of clean fellocks the skin cracks and the horse is lame, and the owner loses the use of him for months or weeks. Ventilation is a small affair, yet for want of it the health of stock in stables suffers severely, and disease sets in. It is a small affair to provide good seed at the beginning of the year, but the whole success of the season depends upon it. It is an easy-thing to

deal fairly with your neighbors and make a name that is better than "precious ointment." Many cheat on small occasions, do not deliver what they sell, and get a reputation for meanness that stands in the way of their success.

Our Sugar Supply.

The principal plants which supply the sugar and syrup of the country are the sorghum, the sugar maple, and the sugar cane. The manufacture of beet sugar in the United States is yet in its infancy; in France and Germany it has had the fostering care of the government, and has grown into an important industry. Vermont is the only State that comes near to supplying the wants of its people with sugar and syrup from the maple. The Sugar or Rock Maple, (*Acer saccharinum*), grows abundantly in most of the Northern States, but no system has been adopted in its cultivation, and little pains taken to spare the trees in the primitive forest. Sugar-making is regarded by most farmers who own a "sugar bush," as a small business, to be carried on in February and March, when nothing more favorable offers, as it gives employment at a season when other labor is scarce. The price is several cents a pound higher than the best refined cane sugar, and much more of it might be profitably made.

Since the introduction of the Sorghum and Imphee seed, and the distribution of the former so extensively from this office several years ago, the manufacture of syrup, especially at the West, has become an important industry. The war came very opportunely to stimulate prices, and many Counties made more than syrup enough to meet their own wants. With molasses at 80 cents a gallon, there is no doubt that the West, and perhaps the East, can make their own syrup cheaper than they can import it. But it remains to be seen whether this can be done when prices drop down to the ante-war standard. There is much complaint of the falling off in this crop the present year in the States where it has been most largely raised. This may be partly owing to the drouth, but we suspect the drooping of prices has had quite as much to do with it.

The cultivation of the sugar cane in this country is confined mainly to Florida and the alluvial portions of Louisiana and Texas. Before the war, Louisiana produced from three to four hundred thousand hogheads of sugar, and yet hardly a twentieth part of the lands adapted to this crop were brought into cultivation. In the other two States less has been done. There can be no doubt that we have in these cheap and fertile lands the means of producing sugar economically for home use and even for export. There are some drawbacks to its production there, but there are also very great advantages. The cane has to be renewed much oftener, and the season of growth is only two-thirds as long as within the tropics. But, on the other hand, the Louisiana planter has the advantage of large protection, a soil inexhaustible with suitable tillage, the latest improvements in machinery, and free labor. The greatest drawback to the rapid development of this industry is the derangement of the levees, resulting from the war. These extend all along the banks of the Mississippi, and of the bayous that run from it by short cuts to the Ocean. The whole success of the crop depends upon the integrity of these embankments, and this cannot well be left to individual enterprise, for every man would live at the mercy of his neighbor. They extend far above the sugar region into the States of Mississippi and Arkansas.

The question naturally arises: "Could not the U. S. Government take this matter in hand and guarantee in some way security?"

A correspondent argues that the Government would do a beneficial thing for the whole people by taking charge of these levees, putting them and keeping them in repair, remunerating itself by a small tax upon the lands benefited. He adds: "This would give security to the cultivator, and invite the capital which this region so much needs for its development. A large capital is already invested in dwellings and machinery, and cleared fields, but much of it is unproductive on account of the overflow. Let the Government afford this security, and this industry will soon be put upon a better basis than it had before the war. The system of small farms could be introduced, if a capitalist would furnish the means of manufacturing the sugar. A hundred small farmers might settle near him and thrive by raising the cane. There need be no more difficulty in organizing this business and dividing the profits satisfactorily, than is found in the manufacture of sorghum syrup, or of cheese in a dairy region. These alluvial lands are fitted to support a denser population than any agricultural region of the North. There is no rock, no sand, not a foot of soil that will not produce its hundred fold."

Our friend is perhaps ignorant that the Government has already appropriated what is equivalent to millions of money for these levees, and now judiciously, we think, looks over the whole ground to see that no more goes in the way that that did. It is indeed true that the judicious aid of a strong State Government, or of the United States, is needed to fully develop this beautiful and productive region from ever-threatened inundation. With all that has been done, this splendid region is but opened, only its river edge settled. We greatly desire to see it redeemed from the dominion of the cypress and the alligator, and made the home of the cane and of man.

China Tree Fences in Mississippi.

AN IDEA FOR WESTERN FARMERS.

[A correspondent of the *Agriculturist*, writing from Mobile, describes a practice followed on the prairies of Mississippi, which may well have imitators in the Western States, wherever the China tree will grow, or a substitute can be found. This tree, which is called also Pride of India, (*Molle Azedarach*), is common in the Southern States, and naturalized in some places. It resembles the Ailanthus somewhat, the foliage being, however, much more delicate, grows quickly, and survives quite severe freezing. En.]

"On the prairie lands of Mississippi not a tree can be seen for miles, except such as may have been planted for shade about dwellings, and the soil is as devoid of rocks as of trees; so the planters resort to the following method of 'growing' fences. They drill in on the line of the intended fence, in the fall, the seed of the China tree; the following spring strong shoots come up, growing several feet in height the first season. These are thinned out to 10 or 12 inches apart, and left to grow, the tops being pruned that they may not be blown down, and also to force as much growth as possible into the trunks. As they grow very rapidly, only about 4 or 5 years are required to fill about one-half the space between them. When of sufficient size, the tops are all sawed off evenly at any height required, (in autumn,) and allowed to fall on either side of the stumps, and to lie and dry during the winter. In the spring, when vegeta-

tion again starts, these tops are set on fire and burned, the heat being usually sufficient to kill the stumps, and soon the bark peels off, leaving a line of straight white posts, firmly set in the earth, which will last for a long time. I don't know as this tree will stand the cold of the Northern winters, but think it will; and if so, only a little time, not much trouble, and almost no expense, will attend the setting of a good fence. Any quantity of seed can be had in this section of country at small cost." C. C. W.

Peruvian Guano and the Chincha Islands.

Along the western coast of South America, south of the equator, little or no rain falls; at some points none whatever, or if any, but a misty sprinkle, as a rare exception. Here all substances liable to decomposition under the conjoint influences of air and moisture, are subject to circumstances rarely met with in nature on other parts of the globe. The waters abound in fish, and so fish-eating birds and sea animals are very numerous along this coast, and especially upon the adjacent islands, of which there are several groups lying at no great distance off the shore. On these islands great quantities of the deposits of the sea birds accumulate, consisting of their dung, with the parts of the fishes which they reject, their feathers, eggs, and immature young, their own dead bodies, etc., and similar deposits of seals, particularly of the Sea Lion, a large kind of seal, occurring here, great numbers of which die and leave their carcasses on the islands. This is "guano,"—"huano," (manure), of the Peruvians. The accumulations of these deposits are so enormous as to make a marked geological feature on many of the islands, but on none are they so extraordinary as upon those of the *Chincha* group.

These are three volcanic islets lying about 14 miles from the coast of Peru, to which State they belong. They are situated just without the Bay of Pisco, and about 90 miles southward from Callao, the port of Lima—places which may be found on any good map of South America.

The great value of this substance as manure was well known to the ancient Peruvians, whose legislation on the subject indicates how they prized it. Killing of the birds at any time, and even visiting the islands during the breeding season, was punished by death. The attention of the scientific world was first called to guano by Humboldt, 1804; and though Sir Humphrey Davy directed the attention of the agriculturists of Great Britain to it as early as 1810, and experiments were made with it, not a single cargo was carried to Europe until 1840 and '41. Since that time an immense trade has sprung up, which is altogether under the control of the Peruvian Government, and productive of a large revenue. The guano is sold by agents of that Government in New York, London, and perhaps at other important ports, and all cargoes taken from the islands are consigned to them.

The Chinchas offer so few attractions, and so much that is positively repulsive, that few travelers have visited them and given minute descriptions of the islands, or reports of their impressions. We are happy in being able to present the accompanying striking pictures taken from photographs of the harbor, and of the guano beds, or better, perhaps, mountains.

From the narrative of Mr. G. W. Peck, published in 1854, and from other sources, we learn much concerning these wonderful islands. Their geological formation is represented as resembling a great piece of furnace slag, full of

Fig. 1.—VIEW OF MIDDLE ISLAND AND ROADSTEAD.

bubbles; these bubbles forming innumerable caves and arches. Mr. Peck writes: "The precipices around each of the islands and of the Balista group, which is of similar formation ten miles to the southward, are entirely perforated with immense caves, that often have only a thin

unapproachable recesses." * * * "Sometimes the rock is 100 or 200 feet thick over these caves, at others it is a mere shell precisely like a section of a bubble in a cinder." He adds, "I speak of them as bubbles,—many of them are 60 feet to their roof and more than that across." The

and being moored to buoys so as to lie near the cliffs, the guano is loaded through shutes, in the same way the ship's launch is represented as receiving its load in figure 4. The entire surface of the islands is covered with guano, except where the waves wash the rocks, or the sides are

Fig. 2.—GUANO BED OF NORTH ISLAND.

crust above them, and extend in, no one can tell how far, since only a few of them can be ventured into on account of the surf that rolls in great waves into them, with thundering noises and perpetual turmoil. Far within, the dark dripping ledges may be seen covered with nests

author also mentions caves 100 feet high and arches 150 feet high and 200 feet across.

These cavernous patches of rock in the ocean rise to a height of 200 to 350 feet, having a few beaches where landings can be made, and no points at which ships can be moored to wharves,

precipitous. In the deepest parts it is not less than 100 feet in depth. The composition of different samples varies somewhat, but much less than would be supposed from the color, which in some places is a light ochreous yellow, and in others quite red. Figure 1 shows a view of

Fig. 3.—PORTION OF GUANO BED.

Fig. 4.—LOADING GUANO.

and birds, wherever nests can be stuck or birds stand; and along with the wind and spray that rush out as the waves advance, come the hoarse cries of penguins and the roar of Sea Lions which have their favorite haunts in such

on account of the constant roll and dash of the great waves rolling in from the broad Pacific.

Ships are moored in roadsteads between the islands, and receive their loads from large boats, though sometimes the ships approach the shore,

Middle Island, with the roadstead gay with shipping, and in the foreground the top of one of those remarkable arches before described. Figure 2 shows the great guano bed on North Island, a nearer view of a portion of which is seen in fig. 3.

AMERICAN MISTLETOE.—(*Phoradendron flavesceus*.)

Parasitic Plants.—The Mistletoe.

The European Mistletoe, (*Viscum flavesceus*.) is familiar to us from the frequency with which it is mentioned in literature, and the legends and superstitions connected with it. With the Druids it was, when collected at the proper time, a charm against diseases; to this day it is hung up among Christmas decorations, and kissing under it is a custom, though we are not informed that it is one confined to that particular time and place. Our American Mistletoe, though it differs from the European in some points in the structure of the flowers, bears a general resemblance to that, and would no doubt prove equally efficacious in the particulars above mentioned. The botanical name of our plant is *Phoradendron flavesceus*. The generic name is from the Greek for *thief and tree*, and has reference to the habits of the plant, which lives by stealing its food. Our plant is found from New Jersey and Illinois to Texas, and perhaps further south, and other species are common on the Pacific coast. It is a true parasite, that is, it is not only attached to the tree, but penetrates its substance and lives upon its juices. We have mosses and lichens, and in the tropics there are many orchids, ferns, and others, that grow upon the branches of trees, but derive their sustenance from the atmosphere; these are not properly parasites, but epiphytes. The epiphyte is simply a lodger, while the parasite has both board and lodging. The Mistletoe produces a small, one-seeded berry, which is exceedingly viscid and sticks with considerable tenacity; this property enables it to adhere to the branches of trees, to which it is probably conveyed by

birds. The seed, thus attached to the bark, germinates and throws out its radicle, which fixes itself to the bark and ultimately penetrates it, and the plant, finding nourishment in the sap of the tree, develops itself. The stems grow from nine to eighteen inches long, are much branched, woody, but rather brittle. The leaves, (which endure all winter,) are from three-fourths to over an inch long, leathery in texture, and, with the stems, of a yellowish-green color. The flowers are small and greenish, the staminate and pistillate being on different plants. The engraving, taken from a Maryland specimen that was somewhat injured in transportation, shows the shape of the leaves, the general habit of the plant, and the manner of its attachment to the branch of an oak. Where it occurs abundantly, it is of course injurious to the tree upon which it feeds; in some parts of the South and West it has destroyed valuable forest trees.

We have seen it, in some instances, so abundant as to completely hide the foliage of the tree which served as its host. We have not known of our species proving, as does the European, injurious to orchards, although it might readily become so, as it is not very particular as to the kind of tree upon which it feeds, and seems very much at home on the Wild Cherry. The late Doct. C. W. Short, of Kentucky, informed us that a few unusually severe winters completely exterminated it in his locality, but that after a few years it again appeared as abundantly as ever.

Variegated-leaved Ivies.

The use of Ivy as a house plant has often been advocated in these pages. The ease with which it is propagated from cuttings, the pleasing shape of its foliage, its rich and healthy looking green, its patience with all sorts of treatment, and the interesting associations connected with it, make it a plant every way desirable as a household pet and ornament. In the climate of New York it does tolerably well against walls out-of-doors, but it gets badly cut back in severe winters, though in Pennsylvania and further south, it seems to be quite at home, and flourishes finely. Of late years the forms with variegated leaves have become very popular in Europe, and the catalogues give over twenty named varieties. Some of these are of great beauty, especially those that have well-defined margins of yellow or clear white, in marked contrast with the deep green of the rest of the leaf. Some of the finest varieties do not succeed well in the open air, even in the more genial climate of England, and with us we shall probably find that we must

VARIEGATED IVY.—(*Hedera maculata major*.)

grow even the most robust of them indoors. There is a great difference in these variegated sorts. Variegation, at any rate, may be looked upon as a sort of disease, and the more "pale and interesting" the specimen the more petting it will require. But there are some that, while retaining their pleasing markings, have a vigor of growth that well adapts them for house culture. Mr. George Such, of South Amboy, N. J., an enthusiastic florist, always on the look-out for novelties, has tried a great many of the variegated Ivies, and out of the whole has found two forms that he considers worth propagating. One of these seemed to us so beautiful that we had an engraving made of it, and our artist has given the best representation that is possible with black and white. The leaves are finely mottled with yellowish-green and pure yellow, and have none of the sickly look so common in variegated plants. The specimen had apparently all the vigorous growth of common Ivy, and like that, put out an abundance of aerial roots along the stem, enabling it to be propagated with the greatest ease. The variegated Ivies should be grown in rather poor soil, as they are liable to revert to their green state if fed on too rich food. If any branch shows markings better defined or different from the rest of the plant, it should be propagated.

VIOLETS AND PRIMROSES.—A lady who was an invalid last winter wrote to us of the pleasure she derived, during her long imprisonment in the house, from sundry pots of Violets and Chinese Primroses. We intended to earlier call attention to the value of these as window plants, but they may now be had already potted of

most florists. The best violet for the purpose is probably the Neapolitan; it is double and very fragrant. It needs a rather cool room and should not be over-watered. The Chinese Primrose is valuable for the long time it remains in flower. It is now to be had in great variety, both double and single flowers, of pink of various shades, and pure white. They are easily raised from the seed, sown in May, but now plants just ready to bloom must be purchased.

Fig. 1.—SECTION OF APPLE FLOWER.

An Apple and How it is Described.

Those not familiar with pomology have in several instances asked us to explain the terms used by writers in their descriptions of fruit. The best way to make the matter understood is to give a general idea of the structure of the apple—and as there are probably many who have been familiar with apples all their lives who have never thought about their structure, we think the subject of sufficient interest to illustrate it. If we examine an apple blossom, the five petals, the most conspicuous parts, first attract the attention. On turning the blossom over, we see the five green points of the calyx, and below these a small green knob, to which they seem to be continuous, which is the calyx tube. The calyx is regarded as being composed of five parts, which are united part way up to form a sort of tube or deep cup, and the rest of the way they are free, and show as the five green points before noted. Now look inside of the

Fig. 2.—SECTION OF APPLE.

flower, and the numerous stamens with their yellow knobs or anthers will be seen just within the petals, and in the very center of the flower

will be found the elongated parts (styles) of five pistils. These parts seem to be all united at the base of the flower, or to rest upon the calyx tube. To get a better idea of the structure, cut the blossom open lengthwise, as in figure 1, which shows one of the points of the calyx, b, two whole petals, c, and part of another, several of the stamens, d, and three of the five pistils, e. The lower portion, or ovaries, f, of two of the pistils are shown as cut open, exposing the ovules or undeveloped seeds. The ovaries are surrounded by and closely united to the calyx-tube, a. This, then, is the appearance of the apple blossom, so unlike the fruit which is to come from it. Now let us note the changes that take place. A few days after blossoming, the petals fall to the ground and decay, the stamens wither, as do the long portions of the pistils, the points of the calyx remain alive, but instead of spreading as they do in the blossom, they usually curve in toward one another, and grow but little, if any. Not so the remaining parts. The ovaries, f, increase in size, but the calyx tube, a, does this in a still more remarkable degree, and grows out of all proportion to the other parts. We will now trace the parts of the blossom as they appear in the ripe apple, a section of which is given in figure 2, the letters used in figure 1 applying to the corresponding parts here. The calyx tube, a, is now the most conspicuous part, it having swollen in all directions in such a manner as to surround the stem, which now appears sunken in a cavity, j, and to bury the now insignificant calyx points, b, in

Fig. 3.—APPLE.

what is called the basin, h. The eatable portion of the apple is the calyx tube, which has not only increased many fold in size, but has undergone other changes quite as striking. In the flower it was green, hard and bitter, scarcely differing in its taste from a leaf or other green part. Now it becomes richly colored, mellow, juicy, contains an abundance of sugar, with a refreshing acid and a grateful aroma.—A wonderful chemist is the sun. Above we alluded to the calyx tube as being composed of five parts united together; we very often see apples with five wavy ridges upon them, and in one or two sorts five distinct lines may be traced from the eye to the stem. The ovaries, f, have also enlarged, and form the core, between which and the enlarged calyx tube, a, a well-defined line can usually be traced, especially if an apple be exposed to the air for a short time after it is cut. That portion of the core forming the cavity which contains the seeds becomes tough and parchment-like, and lines the cells, each of which contains two seeds. Enclosed by the points of the calyx, b, is a sharp depression, i, called the eye, and within this may usually be found the withered stamens, etc. The calyx end of the apple is then plainly the upper end, but as the fruit increases in size the weight is

more than the stem can support, and what is really the lower portion, the stem end, appears uppermost. In descriptions of apples, the size,

Fig. 4.—PEAR-SHAPED APPLE.

and shape, color, and other external appearances of the skin are first given, then the basin, h, is described; it may be deep or shallow, regular or furrowed; the eye, i, may be large or small, open or closed. The cavity, j, varies in depth and shape as does the stem in length and thickness. All these characters can be noticed upon inspection of the exterior. When the apple is cut open, the relative size of the core is noticed, and if, as often happens, the union of its parts is ruptured, it forms an open or hollow core, which is characteristic of some varieties. The shape and color of the seeds and the texture and flavor of the fruit are described by terms in common use. The pear does not differ structurally from the apple, except that the fruit tapers towards the stem instead of being sunken to form a cavity. There are some pears, however, that look exceedingly like apples, and we have seen malformed apples so like pears that their nature could only be made out by the character of the flesh. As an illustration of this we give in figures 3 and 4 two apples from the same tree, given us last summer by Mr. F. W. Woodward, of the Horticulturist.

Trees Away from Home.

Within certain limits we can readily say whether a tree will succeed or not in a given place. But with regard to the behaviour of trees removed from their native localities to a widely separated one of a not very dissimilar climate, we can not predict with any certainty, and we are constantly meeting with results that we can not explain, save by saying that the soil and situation do or do not suit the trees. The readiness with which foreign plants adapt themselves to new countries, and even crowd out the natives, is well exemplified in weeds—and a little observation will show that foreign trees seem to be quite as well adapted to our climate as the natives, if not better. We need only to quote the *Ailanthus*, *Paper-Mulberry*, *Silver Poplar*, and the *White and Yellow Willows* as familiar examples. Our nursery catalogues are mainly made up of foreign trees, as they are, as a general thing, more easily propagated than most of our own, and grow more rapidly. Among evergreens the two most vigorous growers and among the best for ornamental use as

well as for shelter, are the Norway Spruce and Scotch Pine, both, as their names indicate, of European origin. In California, a State noted for its great trees, it is said that an Australian Eucalyptus makes itself so much at home that it will probably be, before many years, the leading timber tree of that region. Even within narrower limits we find illustrations of the fact that trees seem better adapted to other regions than to those in which they are supposed to be native, and this has a practical bearing to cultivators. We recently saw in a part of Ohio, where the Red Cedar is not known in its wild state, trees of this species growing with such a luxuriance and grace of outline that we could hardly believe it to be the same as the slow-growing, stiff-looking Cedar of the Atlantic States. So with fruit. The winter apples of New England become fall apples in Ohio and Illinois, while their best keeping apples come from the places we should least expect—the Southern States. The Peck's Pleasant and other apples of New England at the West become so large and beautiful that when taken to the East pomologists are puzzled to recognize them. The Concord grape from Massachusetts only attains its greatest perfection beyond the Alleghenies. Leaving other trees out of the question we have yet much to learn about the adaptability of fruits to places. Every local society that keeps a well considered record is doing a good work, and if our American Pomological Society had done nothing but publish its tabulated fruit lists it would not have existed in vain. We hope that the forthcoming list will be made still more valuable by the subdivision of the larger States, and that both local societies and individuals will contribute their information to the general fund.

The Mount Vernon Pear.

Some specimens of this little known variety were recently sent us by Frost & Co., of the Genesee Valley Nurseries, Rochester, N. Y., who obtained them from W. S. Little, a nurseryman at the same place,—and we quite agree with them in the opinion that it ought to be better known. The fruit is said to have originated with the late Samuel Walker, Roxbury, Mass. It is of medium size, roundish-obovate, inclining

MOUNT VERNON PEAR.

to conic; basin shallow, a little wavy; eye small, open; stem stout, inclined, inserted with scarcely any depression, and often with a slight lip; skin of a bright cinnamon russet, with obscure minute dots of a lighter color; flesh yellowish, a little coarse, but very juicy, rich, and vi-

nous, with a delicate and agreeable perfume. Nov. and Dec. We are not informed as to the habit of the tree, but if there is nothing objectionable about that, it is strange that so good a pear should remain so long neglected.

The Cultivation of Horseradish.

In April last we published an article by Peter Henderson giving an account of the manner in which horseradish is grown in market gardens, where it is cultivated as a second crop to come on after cabbages or other early crop has been taken off. An account of the method of Mr. Kelsall, an extensive grower near Manchester, England, is given in the (English) Journal of Horticulture, and as this seems well adapted for growers in the small way, we give an abstract of the article. The ground is prepared by putting down a ridge of well decomposed manure, on each side of which a trench is cut, and the soil thrown up so as to cover the ridge of manure both on the sides and top—how high the ridges should be is not stated, but it is said: "The higher they are kept above the general level of the ground the better."

"The beds having been made as above described, the next proceeding is to prepare the sets. For this purpose Mr. Kelsall uses the long, small roots which grow out from the main plant; the longest, straightest, and cleanest of these are selected to form the future giant sticks of horseradish, and are prepared in the following way: Take the piece of root in the left hand, then with the right rub off all the eyes and young fibrous roots, leaving about a quarter or half an inch undisturbed at the largest end of each piece." * * *

"In planting," continues the writer, "a piece of stick is pushed from the top edge of the bed in a slanting direction towards the middle of the bed; the sets are then placed in the holes thus made, but care is taken in performing this operation to place the pieces of root in the holes as straightly as possible. Care must also be taken to place the smallest or right end in the hole first, otherwise the order of things becomes reversed, and the root, or that portion of the piece intended to produce the future roots, will occupy the position of the crown. The piece of root should be pushed in about 2 inches further than the edge of the bed. The piece of root, or set, having been planted in this way, it will soon commence forming roots at the base, and these will at once search out the manure which has been placed in the centre of the bed. As soon as they have found it the set will increase in size to an extraordinary extent, and speedily a bud will break out from the other end, which forms the crown of the plant. When leaves appear, reciprocal action between the root and foliage is carried on energetically, and the plant is then matured with great rapidity. Scarcely a single root is formed between the crown and the base of the root-stock. Here there is a cluster of roots which have found their way into the manure, and the straightest and best of these must be saved for making future plantations. The set does not grow any longer after being planted, but increases in thickness to a wonderful extent, and, from the base to the crown, is white and perfectly free from roots."

A bed like this can be readily covered with litter or manure, and the horseradish be accessible at almost any time during the winter.

To KILL APHIDES, OR PLANT LICE.—The veteran pomologist, Thomas Rivers, says: "For

aphides of all kinds, in-doors or out, winter or summer, 4 ounces Quassia chips are boiled ten minutes in a gallon of soft water, and while cooling, 4 ounces of soft soap dissolved in it. Many hogsheads of this are used here in summer, and always with effect. Sometimes two dippings of the shoots, or brushings of the under surface of the leaves, are required. This innocuous mixture has superseded filthy tobacco juice and many disagreeable compounds." It would be well to try this upon the aphids that is now so troublesome on the young shoots of cherry and other trees. As the preparation is unexpensive, it could be used on a large scale by means of a garden pump or engine.

Making Straw Mats.

Those who use hot-beds or cold frames can hardly dispense with straw mats for covering them. The usual way of making them is to lash straw in handfuls to cords stretched lengthwise for a warp. A correspondent, "N," of Milford, Conn., sends us his way of making the mats, which he considers easier and better. "Stretch the cords for the under side of the mat, (five is the usual number), lay on the straw, then stretch above the straw an equal number of cords, directly over the others. Then *sew* through the straw, catching the strings both ways, in the same way that brooms are sewed. To straighten the edges, lay a straight-edged board on the mat, stand on it, and with an axe chop-off the ends of the straw. By this method the straw is all laid on at once, and there are no seams to allow of the passage of air." The plan of Mr. N. looks practicable. In whichever way the mat is made, the straw should be laid on evenly, and at right angles with the warp. The but-ends of the straw should be placed at the edges of the mat, and the upper ends lap over in the centre, taking pains to keep the thickness uniform throughout. The making of mats is good work for stormy weather in winter, and they are of great utility in protecting plants from early and late frosts.

THE GOLDEN YEW—*Taxus baccata variegata*.—This is one of the few variegated evergreens that have a positive character, and is really fine. We think we never saw a more brilliant single specimen than one of these in the grounds of Parsons & Co., Flushing, L. I. The markings are of such a rich yellow, as to entitle it to be designated as golden. A charming shrub for a lawn, or to put in contrast with plants with dark green foliage. Unlike most variegations, this one is said to be harder than the species.

Another Comparison of Tomatoes.

Within the recollection of many of our readers, the tomato was a rarity. It is now a crop of such importance that it is a matter of no little interest to the cultivator to know which among the many varieties now offered by seedsmen is the earliest and most productive. We have already published some comparative trials, and as we wish to present all sides fairly, we give another, which differs in its results from those already given. Mr. W. H. Meadville, Penn., (an old subscriber, indeed, for he tells us he read the first number of the *Agriculturist*.) writes:

"I wanted to find out the best variety for our particular locality, (Meadville, Pa.) where the season is very short—shorter even than in some farther north. I experimented with the follow-

ing four kinds: Early York, Early Smooth Red, Tilden, and Keyes' Early Prolific. I weighed the products of each patch (of the several kinds) as they were picked from day to day, endeavored to keep an accurate account, and at the end of the season, (Oct. 1st, when a killing frost occurred), found the result to be as follows, *per plant*: Early Smooth Red, 2.5 lbs.; Tilden, 2.6 lbs.; Early York, 6.2 lbs.; Keyes, 10 lbs.

"This will probably be considered a very small yield for any of the varieties. I was surprised at it, having expected more, at least from the Tildens, with their large, fine looking fruit. But the difficulty with the Tildens and the Reds was not that they did not set enough of fruit, but that they did not ripen it up fast enough for our short season. On the last day of September, the vines were still green and flourishing, having an abundance of unripe and small tomatoes on them, and even blossoms. That night the frost came and swept them all away. The Yorks and Keyes, on the other hand, ripened up nearly all their fruit, and made no futile attempts to blossom out of season. The leaves were fading and dying before they were touched with frost at all. They did their work well, and having nothing more to do, prepared for death. I incline to think that the Yorks and Keyes are relatives, as they have several characteristics in common.

"I may remark that the seeds were all sown at the same time in the same hot-bed, about the middle of April, and set out the last week in May and the first of June. A part of each kind had been previously transferred to a cold bed about the 11th of May. They were treated as nearly alike as possible. I conclude, therefore, from this experiment, that, though the Keyes is not '30 days earlier than any other tomato,' and its leaves are not 'without odor,' it is nevertheless a valuable tomato, especially for a high latitude and a short season; and think that, if I live till another year, I shall plant more of it and less of some others, except for the sake of further experiment. Comparing the Keyes and the Yorks, the Keyes is a smoother, more handsome tomato, and less inclined to rot. I left some of them on the vines for two weeks after they were fully ripe; they wilted and shrunk, but did not rot. They are firm, with a tough skin, on which account they carry well to market, and keep well.

"My Tilden seed was genuine, obtained from Mr. Tilden himself. It may be a good tomato for a more favorable climate and a longer season, but is too slow for us. The first ripe tomatoes were picked from the Yorks and Reds. The Keyes' were a few days later; this has been due to richer soil and more shade. But once begun, they ripened up their whole crop in about four weeks, yielding more per plant in the first two weeks than either of the others."

WHY NOT A RHODODENDRON?—Those who live in cities and towns have usually but a small plot to embellish, hence the necessity of getting the most out of it. The fitting out of such places is too often left to the care of a jobbing gardener who has more conceit than knowledge, and a small front yard is so cut up and filled with a confusion of things that it looks still smaller. We recently passed a place that

struck us as particularly neat. A bit of nicely kept turf had in the centre a magnificent Rhododendron, six feet high, and nearly as wide. With its beautiful, broad, evergreen leaves, and an abundance of buds full of promise for next spring's flowers, it stood in marked contrast to the naked stems of the deciduous shrubs of the neighborhood. A single good plant like this will give more satisfaction than a crowd of shrubs, neither of which has a chance

MIGNONETTE.—(*Reseda odorata*.)

to develop itself. Good nursery grown Rhododendrons (and none others are likely to live) may now be had at from one to three dollars. They may be transplanted in spring or autumn.

The Mignonette and its Culture.

There is perhaps no flower that is so little attractive to the eye as the Mignonette, and yet there are but few so generally cultivated, not only by the florists, because "there is money in it," but in private gardens. It is so common that we were surprised some time ago to receive a letter, saying: "Do tell us something about Mignonette, how it looks and what it is good for." In looks it has nothing to commend it. The petals are so small they make but little show, and when in bloom the most conspicuous part of the flower is the brownish anthers. After the flower fades, the seed vessel grows rapidly, and unlike most seed pods it does not burst, but has an open place at the top through which the

seed can fall out when ripe. The engraving shows a branch with the small flowers, the conspicuous seed vessels, and the rather weedy looking foliage. The odor is to most persons very pleasing, though we have met with a few who disliked it. So much is the odor prized, that besides being grown largely in the open ground, the plant is one of those largely cultivated under glass to supply flowers in winter, and the most costly bouquet often owes its fragrance to this homely little flower.

It will grow readily in any common garden soil, and as it scatters its seed freely a stock is kept up without further care; indeed plants from self-sown seeds are generally the strongest and best. It is to be sown where it is to bloom, as it is one of the plants that do not readily bear transplanting. By sowing in boxes or in pots at intervals the flowers may be had all the year round. The seed is sown in six-inch pots, and when the plants are large enough to handle they are thinned to six or eight, and when these get of good size, (as they are apt to die off from over-watering, they are thinned again to three. The variety called *grandiflorum* has larger flowers and spikes, the plant is more robust, and it is best suited to pot culture. What is called "Tree Mignonette" is not a distinct variety, but the plants, though usually regarded as annuals, are by proper treatment made to last for several years. To produce Tree Mignonette but a single plant is allowed to grow in a pot, and this is trained to a single stem, picking off the flower buds as they appear. When the plant has reached the height of 18 inches or two feet, its top is pinched and its branches are encouraged to form a bushy head. When the desired shape is established, which usually takes a year or more, then it is allowed to flower. The duration of the plants is much prolonged if they are not allowed to ripen seed. In house culture Mignonette does better in a moderately cool room than in a warm and dry one; indeed, the plant is hardy enough to bear considerable frost without serious injury. It should have air whenever the outside temperature will allow of it, and care should be taken not to over-water the plants. The Mignonette is a native of Southern Europe; its botanical name is *Reseda odorata*. Its generic name is from the Latin *resedo* to calm, in reference to its supposed medicinal qualities.

THE SPORTING OF FRUITS.—In previous numbers record has been made of some remarkable instances of sporting in fruits, and we gladly receive any examples of these deviations from the original form, as we believe if the fact proves to be one of common occurrence, it will explain many of the differences we see in fruits, especially among grapes. Last autumn, Mr. F. F. Mercer, of Catawissa, Pa., brought to our notice a sport of a grape vine, which is worthy to be recorded. On a vine of Loomis' Honey, a berry much like the Isabella in size and shape, one branch has for several years borne a large, round grape, looking much like a well-grown Black Hamburg. The sport ripens at a later date, and is without the marked sweetness that characterizes Loomis' Honey. We have before noted remarkable sports in the Catawba and Black Hamburg grapes.

THE HOUSEHOLD.

Lap Robes and Picture Frames.

EXTRACTS FROM THE PRIZE ESSAY BY MISS EVA M. COLLINS, ROCHESTER, N. Y.

Some time ago we sent a number of things away to be colored. We send the wool requisite for family use to the factory to be spun into yarn. As Ralph was about starting with the fleeces, it occurred to me, as grandmother repeated to him some special instructions concerning a part of a fleece which was to be very coarse for oversocks, that coarse, slack-twisted yarn from fine wool would make a capital lap robe. It could be colored as brightly as zephyr, would be warmer, more durable, and no more expensive than a horse blanket. I could knit it in Afghan stitch, in long strips, and crocheted them together, and the robe could be as long and as wide as I pleased to make it. How nicely it would look in our large new cutter, and how comfortable it would be, especially when the front seat was in, and both the good buffalo robes were used in front! But Ralph was starting. "Oh! father, call him back." "Halloo, Ralph!" "What is it child?" "Oh! father, put in another fleece. I want to make a lap robe. Can you spare one more?"

Fig. 1.—LAP ROBE.

"Wait Ralph, here is an errand for your little finger, and I expect we shall turn out in fine style next winter."—There is the lap robe complete, (fig. 1)—fifteen strips, four inches in width, and four feet in length—seven of them black, four scarlet, two green, and two orange, put together with scarlet. Katie embroidered a palm-leaf near the points of each strip, fig. 2, as fast as completed, and Jennie made the tassels to correspond. [A palm-leaf in embroidery is nothing like a natural palm-leaf—it more resembles a crazy letter G than anything else, and our artist supposing that it was a very bad G, made his drawing accordingly.—Ed.] About every nine inches we put in a star in zephyr, in colors contrasting with the strips upon which they were worked, to preserve an agreeable harmony of color. Desirable colors not indicated by the colored strips were used to advantage upon the black, alternating with the stars upon the colored strips. Father and I have been initiating the robe into the mysteries of active service, or rather ourselves into sailing under such gay colors with sobriety.

Our "Shakspearean Reading" comes off to-night, and will be at our house for the first time. We begin "Brutus" alias "Julius Caesar," to-night. Father and I stopped at the rectory and found our rector, Mr. N., and the gentlemen who are to read the parts of Cassius, Antony, Julius Caesar and Casca with their Shakspeareans. Mr. N. is Brutus. He is our most correct reader, and whenever he will consent to it, he is made the hero of the play. We meet every fortnight, and read only one act in an evening. Two miscellaneous readers are appointed, each limited to twenty minutes, and several are designated to furnish the music. Father bought an engraving of Carpenter's "Signing of the Emancipation Proclamation" a few days ago, and as I am to read for one, I intend, if our President does not think it out of order, to spend my twenty minutes upon an explanation of the picture, with some extracts and anecdotes from Carpenter's book. The picture looked desolate all alone after it was hung. It was all there to be sure; but there were so many legs, and coats, and arms, as to become wearisome, before it was possible to get into the spirit of the tableau, at least so it seemed to me last evening, as I was studying the scene in view of to-night; but it is all right now. Something is needed above the picture. I would hang my little head of Christ there, only the engraving is so exquisitely fine, the "Cabinet" would look coarse in comparison. The better way will be to bring down the frame I made for Charlie's photograph from my room for to-night, and let Washington preside. The way I made the frame is quite a good one for variety. It is made of gilt paper, which comes in large sheets, one of which is sufficient for three frames like one in fig. 3. The outer row of points is made from strips half an inch in width, cut into pieces two inches in length. The strips used for each of the other rows are a trifle narrower and shorter than for the row immediately outside. Double the paper down first from the left, as in fig. 4, and then from the right, as in fig. 5, and sew each row of points, beginning with the outer one, upon an oval cut from an old box cover, fig. 6. The inner row of points is a piece of the gilt paper upon which points are cut neatly, and pasted over the last row of stitches, fig. 7.

Department at Table.

A mother wishes to know what she shall do to secure agreeable manners in her children at table. There are probably a good many mothers among our readers pressed with the same solicitude. Good breeding shows itself at the table more than elsewhere, for here we come to gratify an animal appetite, and without some painstaking to redeem its coarseness the repast is likely to be purely an animal exercise. Children learn more readily from example than from precept, and unless the parents are agreed in having a little formality at the table, it will be impossible to form decorous habits in the children. If the parents will observe the rules of good breeding themselves, there is very little difficulty in training the children. It helps the matter very much to have the table set in an orderly manner. Every article to be used upon the table should have its place and be in it at the beginning of the meal. It is a terrible annoyance to any well bred person to have a perpetual running to the pantry or kitchen for some forgotten article. Then neatness in the appearance of the table helps neatness and order in the children. Clean table-cloths and napkins are contagious somewhat. The meals should be at fixed hours, and punctuality at the table should be insisted upon. Nothing should be allowed to intrude upon the time allotted to meals. It should be made a time of leisure and social enjoyment. Mental care and haste disturb digestion and make dyspepsias. There should be a few rules observed in good soci-

ety laid down and enforced so early that the child will have no remembrance of a wrong way of using his knife and fork or hawdling his cup or goblet. Politeness is always to be insisted upon, and brothers and sisters should be made to study each other's happiness. This will make them agreeable in larger circles. Politeness often contributes more to one's success in life than brains or capital.

Foot Warmers.

Many people suffer more in the winter from cold feet than from any other cause. The feet are easily kept warm while exercising, but in a sitting posture, while riding in a carriage, or at home, there is much inconvenience and exposure to taking cold. For invalids it is especially important that a good circulation of the blood should be kept up at the extremities. Those ancient and time-honored devices to remedy cold feet, the junk bottle and the stone jug filled with hot water, often led to petty disasters, more vexatious than perilous. The corks would fly out or get loose and make a bad matter worse. Yankee ingenuity has improved upon these primitive inventions, and we have in fig. 1 a vessel holding about two quarts of water, quite as conven-

Fig. 1.—STONE-WARE FOOT WARMER.

iently handled as the bottle, and the cork inserted upon the top so that if it fly out under pressure of steam there is no danger of leakage. This is a very convenient article for the bed of an invalid or for the carriage in a cold day. Fig. 2 is another form of the same article. It presents a larger surface to the feet and is more convenient for use while sitting. If wrapt in cloths or sheepskin with the wool on, it will retain its heat for a long while. The heated stone or brick has been improved upon by cutting slabs of soap-stone into convenient sizes, and putting handles upon them. They are much neater in appearance, and are always at hand. Fig. 3. Aside from the suffering which these articles prevent, there can be no doubt of their usefulness even for those in health. It is much better for a robust man to ride with comfortable feet, than to be benumbed with cold. It is by timely attention to little things that the health is preserved.

Gems or Aerated Rolls.

The only convenient article for cooking Gems is a French roll pan for baking, shown in the engraving, and we cannot warrant success in anything else. The pans are made of cast iron, and can be had at the large

FRENCH ROLL PAN.

hardware and furnishing stores in the cities at about \$4.50 per dozen, and 75 cents single. Put the pan upon the stove, heated nearly to redness. Take one cup of water, one cup of milk, and three cups

of flour, of the best quality. Stir in the flour gradually, and with a spoon beat the mixture five minutes briskly. The object of the beating is to get as much air as possible into the batter. Put a piece of butter of the size of a pea into each of the moulds, and fill about two-thirds full with the batter. Put immediately into a very hot oven, and bake for twenty minutes, or until nicely browned.

This form of unleavened bread is the best article for breakfast or tea we have ever found in that land of good housekeepers, Eastern Connecticut. It is exceedingly light, palatable, and nutritious, excellent for invalids and dyspeptics, and quite as good for people in sound health. They are so nice that we hope our readers will try the article for themselves. We bear no ill-will to the hop growers, or the vendors of soda, saleratus, and other salts, but we have no doubt that the Gems once introduced into a family would greatly diminish the use of these unwholesome articles in cookery, and help to promote health and good digestion.

Comfort for Housekeepers without Help.

Mrs. E. E. K. O., of Illinois, writes us, in an account of one day in her family. "My neighbor was in and said she had made a whole dress to-day. She has no help and has as many in her family as I have. I have a washing machine, a wringer, and woman to wash, and a sewing machine. I can easily get some one to come and make up new garments, but no one to mend. I really like to mend, and it is possible I spend more time upon an old garment than it is worth. Intelligent domestics that know how house work should be done will not go out to service unless they are obliged to, and I prefer doing my own house work to having poor help. Girls think that their ideal husbands will never look into a kitchen for a wife. I suspect it is better for my children, perhaps better for me, to be without help. They try to wait upon themselves and to help me more than they would if I was less pressed with cares. I think I see an improvement in them since I gave them those two little books in which I write down their deeds both good and bad. They help me many times, that they may have the kindness put to their credit in the book, and check rising anger that it may not be set down against them. Exchanging work with them and rewarding them encourages their industry. Yesterday Anna washed the dishes, and in the evening I made her doll a dress. Orin picked up a basket of chips and brought them in, and I told him about the Israelites crossing the Red Sea. He works with great alacrity when I promise to tell him a Bible story."

The topic touched upon by our correspondent is one of very great importance in all our families. The training of children to industrious habits is much more likely to be well done in a family where necessity is laid upon the parents to work. The curse is in a measure taken off from toil where it is shared by a mother's love. Children come to love the labors of the household for the sake of lightening her burdens. The child's view of washing, cooking, and mending, is very much affected by the person tied up to these duties. If Bridget is always associated with the wash tub and the cook stove, a little of Bridget's coarseness attaches to these household offices. If mother does these things they are redeemed from all vulgar associations. There is nothing pertaining to house-keeping that the daughter may not learn with honor. She will be eager to master the mysteries of the kitchen, without suspecting that she is any less a lady for the knowledge. Society is suffering so much for the want of good housekeepers and servants that we think mothers ought to welcome almost anything that will make their daughters thoroughly skilled in domestic duties. Very much of the trouble with servants arises from the fact that the housekeeper does not understand their duties, and so is not reasonable in her requirements. She is not at home in the kitchen, and there are no common sympathies between her and her servants. A woman well trained in her early home not to despise any useful office seldom fails to make a good

wife and mother, and to have a happy, well-regulated family. Our correspondent takes a comforting view of "the situation," and is pursuing the right course with her children. We especially like her devices of keeping account with them, and of exchanging work. Such a course will encourage self-restraint and promote industrious habits.

A Picture in the Backwoods.

The cars ran off the track and we were detained two hours near a log house. It was in the midst of a corn field, in a clearing, made a dozen years ago or more. There was no carriage road passing it, and we suspect the family owned nothing but a cart that went on wheels. Yet the man owned a farm of fifty acres and valued it at fifty dollars an acre. It was good land and yielded bountifully. In the main room of the dwelling, which answered for parlor, sitting-room, and lodging-room, sat the wife and mother bare-footed, with a pipe in her mouth, and sewing in her lap. Near her sat a married daughter with the same attire for the feet, rocking the cradle. In the ell, where the kitchen work was done, stood another grown-up daughter with bare feet, mixing the corn meal dough for the evening meal. There was not the slightest indication of embarrassment at the dishabille. The ladies of the household were manifestly in the habit of receiving calls in that style of dress. There was no carpet upon the floor, and never had been. There were no pictures upon the walls, no books upon the shelf, no ornaments about the room, nothing that did not contribute directly to man's physical wants. There was no yard about the house, either in front or rear. There was not a fruit tree in sight, not a tree for shade about the dwelling, not a flower, not even a Nasturtian growing under the window. There was a shed in the rear, of the rudest pattern, where flour, corn meal, and the meat barrels, were sheltered. There was a log barn, with a stall or two in it, and a place for hay and corn. Beside these, there was no other convenience about the dwelling to indicate that man had other wants than the brutes. Yet here two human beings had lived for half a generation and reared a family of children, as rude, as ignorant, as destitute of taste, as themselves. We come at some truths best by contrast, and it cannot fail to profit some of our desponding readers in cheerful homes to study this way-side sketch of a dwelling in the clearings.

A Home-made Coal Sifter.

When anthracite coal is burned, there is often a great deal of waste. The sifting of the refuse of the grate or stove is by no means a pleasant operation, and it is often, especially where there are servants, thrown away, and thus a considerable amount of fuel is lost. Quite a number of contrivances, most of them patented, have been devised for facilitating the process of sifting, some of which answer the purpose very well. A correspondent, E. J. P., sends us from Milford, Mass., a plan of an easily built, home-made sifter, that has the merit of being cheap and apparently efficient. The materials required are an old flour barrel, a coarse sieve, a piece of one-sixteenth-inch wire, and an old broom-handle. Bore holes just above the second hoops of the barrel, and put two pieces of wire across it; clinch these on the outside so that they will make a firm place for the sieve to rest upon. Midway between the wires bore two $1\frac{1}{2}$ inch holes on opposite sides of the barrel; saw two notches in the broom-handle, just wide enough apart to receive the edges of the sieve. Put the broom-handle through the holes in the barrel, set the sieve in the notches cut in the stick, put on some kind of a cover over the top of the barrel, and the thing is ready. By pushing the stick backward and forward, the sieve slides upon the wires, and the sifting is done with ease and without dust. The ashes are a nuisance in towns, but in the country they are useful for walks, and as an absorbent in privies.

Recipes for Cooking.

The following are contributed by Mrs. D. W. Sutton, Westchester County, N. Y.

Bread.—Sift into a good sized wooden bread bowl a quantity of flour, say seven pounds, make a hole in the center of the sponge, (or in winter, some prefer setting the sponge in the tray of flour), or if the sponge is quite cold, and you wish to hasten the process, put in warm water or milk, a little hotter than it would do to set the sponge in. Thicken it up with flour until cool enough to receive the sponge; then add a handful of salt, then the sponge. Stir the flour around from the inner edges with a spoon, until a tolerably stiff batter is formed, knead until perfectly clean and smooth, and if kneaded several times, it is finer grained. A small lump of butter or lard rubbed into the flour, while it is dry, makes a nicer crust. In hot weather the batter should be made of cold water, especially if set over night, which is a good plan, preparing it about bedtime. When light again after kneading, mould into loaves and put into greased pans; cover and let it rise the third time. When light, prick the loaves, to prevent cracking, and bake in a hot oven. Care should be taken that it does not get chilled or scalded. If it threatens to be sour from the yeast, or heat, dissolve a small portion of soda, and incorporate it thoroughly. It is thought to be a great improvement by some to add a small quantity of mashed potatoes; others add a small quantity of warm Indian pudding.

2. Rye Bread is varied but little in process from the above. It is preferable to set wheat or middlings for the sponge, add a piece of butter or lard, mix most entirely with a spoon, then make into loaves, and put into well greased pans to rise. It requires longer time to bake, and a brick oven, and if it remain in the oven until cold, it is improved.

3. Turnpike Yeast Cakes.—Make good, fresh scalded emplings, as in Nos. 1 and 2, then boil up hops, about a double handful, in about two quarts of water, with several sweet apples sliced, and a handful of peach leaves if convenient. Pour this liquor scalding hot, and strained, over about enough Indian meal to thicken; when cool, mix about a quart with the light, fresh yeast, and when light again, thicken stiff with more meal, and make into rolls about as thick as a rolling pin. When a little light again, cut off in cakes not quite a half inch in thickness, and dry in the shade. This is more convenient to make into cakes than either to roll out and cut, or to form with the hands. It may be dried in crumbs if preferable. Great care should be taken after it is thoroughly dried, to put in a tight bag and keep in the dark. Though good for a year, it is better to make it every six months in dry weather. For use, soak a cake until it will crumble up fine, and mix with a quart of warm water, thickened with flour.

Pumpkin Yeast.—Boil a pumpkin soft, and mash fine, and thicken it with Indian meal and a handful of salt; when cool, add two cups of yeast. This is very convenient and nice for winter, as it will keep four months or more in winter if kept in a cellar where it will not freeze. All yeast should be kept where it will not freeze in winter.

Bottled Yeast.—Boil down one quart of hops in two quarts of water, one-half; boil and mash 12 potatoes to add to this liquid; add one cup of sugar, a tablespoonful of flour, one-half cup salt.

Rye and Indian Bread.—Two parts of Indian meal to one of rye; put the corn meal into your bread pan, with a little salt and molasses, wet it with scalding water, and be sure that it is scalded, working it at the same time with a spoon. When lukewarm add the rye, a cupful of good yeast, and mix it up with water not very stiff, knead it into loaves, let it stand to rise, and bake in a moderate oven.

Buns or Rolls.—Thicken one quart of warm water or milk, add a little salt, one half cup of melted butter, and one cup of good yeast; make into biscuits for morning, or into an oval roll, and draw a deep cut. If not very light, add a little soda.

Exposition Universelle.

The Intelligence and Judgment of the Imperial Commission to the matter of awards are clearly evinced in the following extract from

The Exposition Universelle Illustrated.

("Publication authorized by the Imperial Commission") "By their skill, universally recognized, Messrs. Wheeler & Wilson added to Howe's system of sewing machines important modifications, which have placed them in the front rank of manufacturers.

"The gold medal which has just been awarded them confirms, moreover, that none of the machines from the workshop of Howe, or of his principal tributaries, unite the qualities of simplicity and solidity of mechanism by which these machines are distinguished above all others.

"In their machine, remarkable for its form and elegance, they have substituted for the shuttle of Howe a small flat disc which revolves vertically with unvarying swiftness. Hence this machine is the most simple of all, and notwithstanding its great precision in operation, its price is not above that of the most imperfect systems.

"Elegance, perfection of work, simplicity, solidity of mechanism, and facility of management, such are the essential qualities united in the Wheeler & Wilson machine, constituting a superiority which the jury has with unanimity recognized and proclaimed.

"To these gentlemen the gold medal was awarded as *manufacturers of machines*; to Mr. Elias Howe a similar medal was awarded as *propagator*. The distinction made by the jury explains itself.

"The original machine of Thimmonier only needed to pass into the skillful hands of Wheeler & Wilson, to require its highest perfection. To-day, thanks to its cheapness, their machine is accessible to all. Its simplicity assures it not only a place in the chamber of the seamstress, but its elegant form wins its admittance into the most sumptuous parlor."

TURNER'S PATENT EXTENSION LADDER.

READILY LENGTHENED OR SHORTENED, IS SELF-SUPPORTING, EASILY TRANSPORTED, CONVERTIBLE INTO A STEP-LADDER OR SCAFFOLD, IS USEFUL TO HOUSEKEEPERS, FARMERS,

FRUIT GROWERS, MECHANICS, etc. MANUFACTURERS OF AGRICULTURAL IMPLEMENTS, WOODEN-WARE, &c., can purchase rights to make a profitable article.

A PORTRAIT OF MR. GREELEY.

The publishers of THE NEW YORK TRIBUNE having received many inquiries from time to time for a good likeness of the Editor, have made an arrangement with Messrs. Derby & Miller to furnish copies of Fitch's engraving, from a photograph by Brady, which will be sent to such subscribers to THE TRIBUNE as wish it on the conditions below. This is much the best likeness of Mr. Greeley that has been engraved. The print sells for \$1. Each subscriber who sends us \$10 for THE DAILY, \$1 for THE SEMI-WEEKLY, or \$3 for THE WEEKLY TRIBUNE, the paper to be sent by mail, and who requests the engraving at the time of subscription, will have a copy carefully mailed, post-paid, to his address. One will likewise be sent to any person who forwards a club of ten or more Semi-Weeklies or twenty or more Weeklies, at our club rates, and asks for the portrait at the time of remitting.

THE FARMERS' CLUB OF THE AMERICAN INSTITUTE.—The full Reports of the American Institute Farmers' Club, published in THE NEW-YORK WEEKLY TRIBUNE, from which the Institute's official report is made up, would each year make two large volumes of over 500 pages each, if printed in book form. Two Dollars per year. For sale by all newsmen.

TO FRUIT GROWERS.—Fruit Growers will find the discussions of Fruit Growers published in THE NEW YORK WEEKLY TRIBUNE of great value. No Fruit grower can afford to be without THE TRIBUNE. Price five cents. Two dollars per annum. For sale by all newsmen.

NEW YORK MARKETS.—THE NEW-YORK WEEKLY TRIBUNE publishes full reports of the New York Cattle, Sheep, and Hog Markets, as well as the Produce and Miscellaneous Markets. Price \$2 per year. For sale by all newsmen.

STOCK-RAISERS will find in THE NEW-YORK WEEKLY TRIBUNE a vast amount of profitable and interesting information.

THE NEW YORK TRIBUNE.—Postmasters and others can obtain THE WEEKLY TRIBUNE gratis by joining clubs. See Terms in another column.

TO WOOL GROWERS.—Wool-growing is a prominent feature in the Agricultural Department of THE NEW YORK WEEKLY TRIBUNE.

Order at once, and send 10 cts. for the New Edition of our Small Fruit Catalogue.

See Dec. No. of American Agriculturist, page 461.
J. KNOX,
Box 155, Pittsburgh, Pa.

James J. H. Gregory,
GROWER & IMPORTER OF
CHOICE VEGETABLE SEEDS,
Marblehead, Mass.

As the original introducer of the Hubbard Squash, Marblehead Mammoth Cabbage, and many other choice vegetables, I invite the attention of the public to my Seed Catalogue for 1868, which will be sent free to all applicants. Those who sent to me for seed last year will receive it by writing for it. I raise mainly rare vegetables of speciality. I have cultivated on my three seed farms this season over fifty acres of seeds and seed stock. These farms are over a mile from each other, and the seeds of two of them are much scattered, thus giving me ability to grow many varieties of seed of the same kind, while each variety is so perfectly isolated as to ensure purity. On these three farms I have raised over 100 varieties of vegetable seeds the past season, including nine varieties of Cabbage Seed, eighteen of Tomato, five of Onion, six of Beet, four of Carrot, seven of Cucumber, fifteen of Corn, five of table Peas, nine of hush Beans, six of pole Beans, seven of Squash, four of Mangold Warrig, &c., &c.

I can import or buy, as chance offers, much of this seed at about one-half of what it costs me to raise it, but I do so that I may know what I send out and be able to warrant it for purity and freshness. The great risk with all seed that a dealer imports or buys of others is that the dealer knows only what is told him of the careful selection of seed stock—and the freshness and purity of the seed, while the person who offers it, though oftentimes reliable, may be careless, ignorant or dishonest, and if so, you who plant it have to suffer, as the dealer can only reaffirm what is told him; but if the seed dealer grows his own seed, then he is able to reaffirm what he himself knows, as to its purity and freshness. If I selected the stock, planted it, gathered the seed, and prepared it for market, and thus you who plant it have this invaluable guaranty from his own knowledge of it. *That I may be able to give this guaranty that I grow so many varieties at double what it would cost me to purchase many of them, while at the same time the public will not find my prices for standard seeds higher than those of other dealers of repute. There are many varieties which I have to import, and others that I have to purchase from growers; with these I use my best judgment and experience for the security of my patrons.*

If the public wish to encourage this enterprise (which I doubtless will) and procure their seed directly from me, I invite a continuation and fair increase of the patronage that they have heretofore so liberally bestowed.

JAMES J. H. GREGORY, Marblehead, Mass.

BEST EARLY TOMATO.

Seeds Given Away.—Any one sending us four cents in stamps before January 20th will receive a packet of the **BEST EARLY PROLIFIC** Tomato seeds, together with our **ILLUSTRATED DESCRIPTIVE CATALOGUE OF SEED POTATOES, & VEGETABLE NOVELTIES** by address

L. D. SCOTT & CO.
Huron, Erie Co., Ohio.

CABBAGE SEED,
IMPROVED BRUNSWICK.

The Earliest, Shortest Stemmed, and very best Drumhead yet offered. The Boston Market Gardeners all use it in preference to any other, and to show how highly it is esteemed in this market, we will state that it sold readily at \$5.00 per ounce the past season, and all were well satisfied that it is the best variety for either early or late planting; every plant produces a good head, when fully grown, weighing from 25 to 30 lbs., and requiring only ordinary cultivation. The quality is excellent. Mr. John Stone, of Marblehead, Mass., the originator of the well-known Stone Mason Drumhead, allows us to state that he considers it far superior to any Drumhead he has ever seen; he has raised good sized heads the past season in 35 days from planting the seed. We warrant our stock the purest in the country. For sale in 25 or 50 cent packages.

We have also to offer a small quantity of the *Early Boston Market Tomato Seed*, the best variety for market or family use, price 10 cents per package. By enclosing the amount of your order, we will forward the seed free by mail; send early, as our stock is limited. Send for Circulars and Catalogues of Seeds.

IMPORTERS AND DEALERS IN

Garden, Field, and Flower Seeds,

Horticultural Implements & Garden Requisites.

The attention of all who are interested in the culture of **Flowers or Vegetables**, is invited to our large and well selected assortment of the above—comprising the newest and most approved varieties, both of European and Home production, the quality of which cannot be surpassed. For a list of which, see our

New Illustrated Seed Catalogue and Guide to the Flower & Kitchen Garden.

The **Fourteenth Annual Edition**, enlarged and improved, contains 124 pages of closely printed matter, **Beautifully Illustrated with 100 Engravings**, and a descriptive list of **Twenty-five Hundred varieties of Flower, Vegetable and Agricultural Seeds**, including all the novelties of the past season, with explicit directions for their culture; also, a list of **One Hundred and Twenty-five Varieties of French Hybrid Gladiolus**.

Embracing many new sorts now offered for the first time in this country—with many other **Summer Flowering Bulbs**, consisting of **Amaryllis, Tuberoses, Tigridias, Lilies**, etc. To which is added a list of the choicest varieties of **Grapes, Strawberries, Raspberries, Currants, and other Small Fruits, Bedding Plants**, etc., cultivated at our gardens, with much other useful information upon the subject of gardening generally. A copy will be mailed to all applicants upon receipt of 25 cents. Our regular customers supplied without charge. Orders addressed as above, either to New York or Springfield, will be promptly attended to.

B. K. BLISS & SON.

CUCUMBER—GENERAL GRANT.

The **very best variety for forcing**.—After three years' experience we can confidently recommend this as one of the most desirable varieties in cultivation for forcing. It also succeeds well in the open ground. It is perfect in form, solid and crisp, and of a most agreeable flavor. Our seeds are all saved from specimens averaging from 24 to 30 inches in length. 10 seeds 25 cents. Also all the leading English and Continental prize varieties of Cucumbers and Melons, at 25 cts. per packet, or five packets for \$1.00.

Address **B. K. BLISS & SON, 41 Park Row,** (Late Office of Agriculturist.) New York.

To the Seed Trade.

J. M. THORBURN & CO.,

15 John Street,
New York,

Have just published their **Wholesale List of Seeds for the Wholesale Trade** only, for the season of 1898. Dealers supplied on application by mail.

A Sixty Pound Cabbage!!

As the original introducer of the **Marblehead Mammoth Cabbage**, I offer the public seed grown by myself from the choicest specimens of the purest stock.

This Cabbage is raised in nearly every State in the Union, weighing from 25 to 60 lbs. For the past few years it has been the standard wonder at almost every Agricultural Fair in the United States and Canada. As the public may rely upon my continued care to keep the seed pure from all admixtures and fully up to its previous high standard, each package has a fine engraving of this remarkable cabbage, with very full directions for culture on it. Sent post-paid by all expresses for one package, five packages for \$1; or 100 packages for \$1.00.

JAMES J. H. GREGORY, Marblehead, Mass.

Early Goodrich and Harrison Potatoes.

Grown from the **Original Stock** by the subscriber, by whom they were first sent out.

Priced Illustrated Catalogue on application.

D. S. HEFFRON, Utica, N. Y.

JUCUNDA—OUR NO. 700 STRAWBERRY.

"The Prince among Strawberries. The fruit is enormously large, and the plant wonderfully productive. Fruit very solid, and the richest and most highly flavored of any strawberry I ever tasted."

JOHN N. JENKES,

Full particulars of this wonderful Strawberry furnished in our **Catalogue**, for which send at once 10 cts.

J. KNOX,

Box 155, Pittsburgh, Pa.

The Three Warrants!!

Let—I will warrant all the seed I grow to be fresh, reliable, and of the highest standard for purity. 2d—I will warrant all money sent to my address to reach me, and 3d—I will warrant all seed ordered to reach my customers. I send out these warrants to give the public confidence in this new development of the seed trade through the mails.

I am aware that in taking these responsibilities I shall incur some losses, for sometimes packages burst from careless handling of P. O. Clerks and other causes, sometimes they are lost, sometimes stolen, or eaten into by mice, but if the public will stand by me by giving me a fair share of their patronage, I will stand by them and take these risks on myself. Catalogue of over 300 varieties of vegetable seeds (over 100 of which are of my own growing) sent gratis to any address.

JAMES J. H. GREGORY, Marblehead, Mass.

CLARKE RASPBERRY.

A few thousand genuine plants of extra quality for sale. Send for Circular.

Hartford Prolific grape vines from single eye, No. 1, \$100 per 1000; No. 2, \$75 per 1000. Concord, No. 2, extra \$75 per 1000. Rogers No. 4 and 5, \$75 per 1000. John, \$25 per 1000. Samples sent if desired. **L. M. BASSETT, No. Haven, Ct.**

MISSOURI MAMMOTH BLACKBERRY, 25" below zero does not injure it. Berries 1 1/4 by 1 1/2 inches. Plants for sale in spring. Also, immense stock of **Small Fruits** lower than by any other nursery. History of Blackberry in Price List—free. Sample thankfully received. Address **JOHN STONE'S NURSERY, South Bend, Ind.**

130 ACRES SMALL FRUITS, Philadelphia and Clarke Raspberries, Early Marion and Kittatunga Blackberries, 4000 Peaches, Peas and Corn Cakes. Send stamp for Catalogue. **WM. FAIRY, Cincinnati, New Jersey.**

New and Rare Vegetables.

I make new and rare vegetables a specialty. Catalogues free. **JAMES J. H. GREGORY, Marblehead, Mass.**

SMALL FRUITS BY THE MILLION.

All of the best and new sorts of Strawberries, Raspberries, Blackberries, Currants, Gooseberries, &c., &c. Those desiring to purchase largely to plant out or to sell again, should send stamp for our **WHOLESALE LIST**. Those desiring to know how to plant, grow, market, &c., should send stamps for our

INSTRUCTIVE AND DESCRIPTIVE CATALOGUE.

We have made **Small Fruits** our practical specialty for the past sixteen years, and have endeavored to give our methods of culture, &c., in this work. Numerous parties have written us that their business has never grown so large as Catalogues, books, &c., on **Small Fruits**, but that ours was the best and most practical work of all. One prominent fruit grower writes us: "Fruit of a person who has never grown a strawberry or any other small fruit, can take your **Descriptive Catalogue** and learn well just *how* and *what* to do." We speak of our last year's (1897) edition. Our new edition will contain many additional valuable hints not found in that for 1897.

Those desiring to act as our **AGENTS** for the sale of plants will do well to enclose a stamp for sample circulars, &c., \$2.00 to \$3.00 per cent. can be realized by each. Address **FURDY & HANCE, South Bend, Ind.**, or **FURDY'S FRUIT FARM, Palmyra, N. Y.**

DEMOREST'S YOUNG AMERICA,

The Best Juvenile Magazine. A Casket of Games, Fun, and Literary Excelsiopes, adapted for the juvenile mind. Every teacher recommends it, and every parent approves it. Don't fail to get the splendid **January Number**, and secure a valuable household treasure. Single copies, 15c, mailed free; yearly, \$1.50, with a good brass-mounted Microscope, or a good Knife, as a premium. Specimen copies, mailed free. **Demorest's Monthly and Young America** together, \$2.50. **Agriculturist and Young America**, \$2.00; or to include the Monthly, \$4.00. Address **V. JENNINGS DEMOREST, No. 478 Broadway, New York.**

JUCUNDA—OUR NO. 700 STRAWBERRY.

"A most remarkable point of value in this variety is the great number of extra large berries. I saw great quantities ten to twelve of which filled a pint."

Geo. M. BEZLER, Late Sec. Ind. Hort. Soc.

Pint baskets holding 10 berries, brought in the New York market last season, 60 cts.

Order at once! sent in dozen plants by mail, for \$1, and send 10 cts. for Catalogue.

J. KNOX,

Box 155, Pittsburgh, Pa.

WHITE CHINA and BREMEN GESE.

WATERBURY DUCKS.

ROUEN DUCKS.

BRONZE BLACK TURKEYS.

S. M. SAUNDERS, Port Richmond, Staten Island, New York.

POULTRY,

Imported and our Own Breeding.

Our stock having taken about twenty premiums at the late Poultry Exhibition, now stands confessedly superior to any in the country, the Judges who awarded the **\$25 Silver Cup** premium, (which was also taken by us), pronouncing them in their opinion, "the most superior collection of fowls ever exhibited in this country by any one party." We have also purchased a number of prize pens in addition to our own. To make room for a new and still finer stock shortly to arrive from Europe, we offer a number of our prize birds as well as our other stock, for sale. For Circulars address **A. M. HALSTED & CO., Agents, 68 Pearl-st., New York.**

THE WHITE HOLLAND TURKEY, White Sumatra Game Fowls and Improved Ohio Chester Hogs are bred and sold only by **L. B. SILVELL, Salem, O.** Send stamp for Lithograph portraits.

CASHMERE GOATS—150 Cashmere Shawl Goats, selected in Asia, by Daniel S. Dyer, for sale. Address **CHARLES S. DYER, 80 Broadway, New York.**

SWINE—27 pages devoted to Breeding, Feeding, and the general management of swine. Send address on receipt of 25 cents. Worth ten times its cost. Every farmer should have it. Address **JAMES YOUNG, Jr., Marshallton, Chester Co., Pa.**

To Agricultural Societies,

Diplomas for prizes, of beautiful and appropriate design, plain or in color, can be had in any quantities of **THE MAJOR & KNAPP Engraving and Lith. Co., 71 Broadway, New York.**

Advertisements, to be sure of insertion, must be received **BEFORE** the 5th of the preceding month.

TERMS.—(cash before insertion);

Ordinary Pages, \$1.50 per line. Open Pages—\$3 per line.
Business Notices—\$2.50 per line of space, each insertion.

EARLY ROSE POTATO.

The most valuable acquisition of many years.

For Sale only by B. K. BLISS & SON.

41 Park Row, New York,

Late Office of the American Agriculturist.

Card to the Public.

I have made an arrangement with Messrs. B. K. BLISS & SON to furnish them for sale a few of the

EARLY ROSE POTATO,

to be sold only by the pound. I shall be unable to spare any more before the fall of 1888.

During each of the three years that I have grown this new variety, it has shown points of superior excellence. It has uniformly ripened ten days earlier than the Early Goodrich; produces less small tubers; is equally healthy and productive as that justly celebrated variety, and is superior in table quality. It is the best early potato that I have ever grown or seen all things considered.

Utica, N. Y., Dec. 5th, 1887.

D. S. HEFFRON.

Having seen and heard much of this celebrated potato—being fully satisfied of its superior merits—I have effected the above arrangement with Mr. Heffron, that we might disseminate it as widely as possible among the interested in the potato culture. The stock for sale being quite small, they will be offered in one point packages only—which will be mailed post-paid to any address upon receipt of *One Dollar*. Orders will be backed in this regular order, as received, and the potatoes forwarded as close as the weather will permit. As we have the exclusive control of all that will be offered for sale this spring, purchasers are requested to be on their guard against spurious varieties. All orders must be addressed to

B. K. BLISS & SON, 41 Park Row, N. Y.,
Or, 231 Main-st., Springfield, Mass.

INDELIBLE PENCILS

For Marking Clothing, &c.

Prices: Single, 50 cents. Three for \$1.00.

Per dozen, \$3.00.

SENT prepaid by Mail or Express on receipt of price. RECOMMENDED editorially by the AM. AGRICULTURIST, N. Y. EVE. POST, GARDENER'S LABORER, SCIENTIFIC AMERICAN, CHICAGO TRIBUNE, DEMOCRAT'S MAGAZINE, LITERARY DIGEST, and most of the other leading Agricultural, Religious, and General Journals throughout the land. MANUFACTURED and sold by

THE INDELIBLE PENCIL CO.,

Northampton, Mass.,
and sold by Stationers and Dealers in all parts of the land.

EAGLE SEED SOWER.

Best hand Seed Sower in use. Prices \$6 to \$18. The seed is distributed by discriminating Seed Box. It has no mechanical movements inside the Box. Clipper Wheel Hoe for pulverizing the soil, and destroying weeds. Liberal discounts to Trade. Send for Illustrated Circular.

Address

E. D. & O. B. REYNOLDS,

North Bridgewater, Mass.

THE DELAWARE LITERARY INSTITUTE, FRANKLIN, N. J., has full equipment, and offers a thorough business or scientific education, at low rates. GEO. W. JONES, A. M., Principal.

SEED POTATOES

Of all the leading varieties, among which are Goodrich's justly celebrated *Harison*, *Early Goodrich*, *Gleaner*, *Collier*, *Carroll*, *Garnet Chili*—*Early Handsworth*, and *Seaton*. Seedling Stock, also the earliest varieties known. *Early Sebec*, or *Boston Market*, *Extra Early White*, *Early Stevens*, *Dykeman*, *Jackson White*, *New White*, *Peach Blows*, also, *PATTERSON'S CELEBRATED ENGLISH SEEDLINGS*, viz: *Napoleon*, *Victoria*, *Irish Blue*, *Blue Bluc*, *Sherry Bluc*, *Forfarshire Red*, *Regent*, *Red Rose*, also *King of the Potatoes*, *Early Frame*, *Red Regent*, *British Queen*, &c. Four Pound Packages of either of the above varieties will be mailed to any address, post-paid, upon receipt of *One Dollar*. Six packages, \$5.00; twelve packages, \$9.00. Prices per bushel or barrel will be given upon application.

B. K. BLISS & SON,

41 Park Row, and 151 Nassau-st.,
(Late Office of Agriculturist.) New York.

Also, 231 Main-st., Springfield, Mass.

Fountain Pen, useful present. One filling writes ten hours; also other gold pens and cases. Send stamp for Circular. C. F. HAWKES, 41 Nassau-st., New York.

AGENTS.—N. B. The N. Y. Man'g. Co., 81 Park Row, N. Y., are still supplying Agents with the newest and best seed varieties. Satisfaction guaranteed. Descriptive Catalogue free. No stamps required.

(Continued from page 40, which see.)

Surpassing excellence for fruit and for wine is now so uniformly conceded to the Iona, that it is scarcely denied, even where prejudice and the strongest adverse interests prevail. The difference between the Iona and the other kinds is not merely great, but so radically great, that it may be said to have no competitors for table and for wine, except its companions, *Israela* and the *Delaware*. In quality, *Diana* follows next, but at as long distance behind as *Delaware* is behind *Iona*.

Four years ago we said, "In hardness of vine, constancy of production, and perfect ripening of abundant crops, it is not surpassed, and perhaps not equaled when under fair treatment, including good plants to begin with."

The history of the past four years has verified our statement by testimony from all quarters, and shown it to be in all respects the vine for general cultivation.

For further account, see Pamphlet and new Price List for spring 1888, in which prices for vines of best quality are reduced so as to leave no profit to the producer.

The great superiority of my plants is generally conceded, and my immense and unequalled facilities for propagation enable me to produce vines of best quality cheaper than can be done elsewhere. All of this great advantage, with my own diligent care and skill, I offer this season to purchasers of vines, without asking for remuneration in the form of profit.

Four years ago I offered a fine stock of *Delaware* plants under similar circumstances. The vines were all taken early in the season, leaving a large demand unsupplied. An opportunity so favorable for the purchase of *Delaware* vines has not been since offered. Such will be the case with my present stock of *Iona* and *Israela* plants. I hope in due time to offer another vine to the public, of very distinct character and worthy to be placed with the other three standard kinds.

C. W. GRANT,

Iona, near Peekskill, Westchester Co., N. Y.

ENLARGEMENT AND IMPROVEMENT!

On the commencement of its Nineteenth Year and Volume,

January 4, 1888,

MOORE'S RURAL NEW-YORKER,

(The Best and Largest-Circulating AGRICULTURAL,

HORTICULTURAL, LITERARY AND FAMILY NEWS-

PAPER in America) will be greatly

ENLARGED AND IMPROVED!

THE RURAL employs the BEST TALENT in all Departments—Practical, Scientific and Literary—and circulates in both Town and Country all over the United States, etc. Each No. comprises Eight Dozen, or Forty Pages, printed in extra large and clear Type, on Good Paper, and is more useful and better ILLUSTRATED than any other Weekly Paper. In brief, *MOORE'S RURAL* is *Ably Edited, Fully and Fully Illustrated, Neatly Printed—Practical, Scientific, Useful—Moral, Instructional and Entertaining!*

Terms.—Only \$3 a Year—less to Clubs and Great Officers (Postman, etc.) to Clubs and Great Officers. Agents or News Agents about the RURAL, or, for Specimens, Show-Bills, Premium-Lists, etc., (which are sent FREE), address

D. D. T. MOORE, Rochester, N. Y.

F. L. PERRY'S PAT. MAR 27 1885

PERRY'S GRAPE VINES

Are all that can be desired in size and abundance of healthy roots. Prices will be found upon application to be as low or lower than any advertised. Liberal terms are offered to those forming Clubs. Correspondence solicited. Address F. L. PERRY, Canandaigua, N. Y.

Are all that can be desired in size and abundance of healthy roots. Prices will be found upon application to be as low or lower than any advertised. Liberal terms are offered to those forming Clubs. Correspondence solicited. Address F. L. PERRY, Canandaigua, N. Y.

Twenty-two Varieties of Tomatoes!

I can supply Farmers and Gardeners who wish to get their Tomato seed directly from the grower, with *eighteen* varieties which I have grown (each perfectly isolated), on my three seed farms the past season. I do not market my early varieties until they begin to ripen, and the very day they ripen a practice which (as experienced gardeners know) tends to improve each variety.

M. A. Y. FLETCHER, EARLY YORK, EARLY, MAMMOTH CHRISTIAN, DWARF SCOUT, EARLY YORK, EUREKA, and FRENCH UPRIGHT, each at 15 cents per package.

Also, the following four varieties, which are not of my own growing, but were obtained from reliable parties. LATEST PERFECTED, FLECK, RED PLEIN, and YELLOW PLEIN, each at 6 cents per package. Any of the above will be sent by mail, postpaid, on receipt of price. Seventy all of these varieties sold also by the ounce. (See Catalogue.) My general Catalogue, containing over two hundred varieties of choice vegetable seeds, and one hundred of which are of my own growing, will be sent gratis to any address.

JAMES J. H. GREGORY, Marlborough, Mass.

SMOKERS ATTENTION!!

Hazman's Seal and Claratite Roller is the Smoker's great friend. See advertisement on page 476, Nov. number *American Agriculturist*. The highest prize awarded at the Fair of the American Institute, New York, 1887, was for the machine with 10 Wrappers—sent for 81. Agents wanted. Address H. C. WITT, 51 Cedar-st., New York.

WANTED, AGENTS to sell Boardman's Patent Lamp-wick Inserter, and Cast Handle Knife. Samples sent post-paid on receipt of 10 cents for Knife, and 10 cents for Inserter. V. A. A. BOARDMAN, New Haven, Conn.

AGENTS, FARMERS' SONS, CANVASSERS, ETC. R. B. The New Publishing Company, 151 Nassau-st., New York. Have issued a Compendium of Facts worth knowing, adapted to all classes, trades, and professions. Sold for 10 cents. Price, 70 cents. No. 1. Sold for (Circular of "Key to Honest Wealth and Guide to Business Success.")

JUCUNDA, — OUR NO. 700

STRAWBERRY.

Price of Plants for spring of 1888:

12 for.....	\$1.00
50 ".....	3.50
100 ".....	6.00
200 ".....	10.00
1,000 ".....	50.00

At the price per dozen and single hundred, we will send plants by mail when desired, larger quantities by Express, the purchaser paying Express charges. Orders will be entered as received, and filled in rotation at proper season.

An acknowledgment, and a circular with brief instructions for cultivation, will be sent at once, to all parties from whom we receive orders accompanied with the Cash.

ORDER EARLY.

Box 155, Pittsburgh, Pa.

CHERRY LAWN FARM.

OUR CIRCULARS FOR 1888,

of Strawberries, Raspberries, Blackberries, Currants, Gooseberries, Grapes, Rhubarb, Asparagus, Seed Potatoes, Vegetable Plants, (Cold Frame, Hot-bed, and open ground), sent to all on application.

Wholesale Circulars of prices to Nurserymen, Dealers, and Large Planters only.

All favoring us with their orders will be liberally dealt with in every respect.

D. H. BROWN, New Brunswick, N. J.

NOTICE.

The New Edition of Our Small Fruit Catalogue contains: Descriptions of all Grapes, Strawberries, Raspberries, Blackberries, Gooseberries, Currants, &c., of any merit. Also Illustrations of the Concord and other Grapes, — *Jucunda* and *Filmore* Strawberries, — *Hornet* and *Philadelphia* Raspberries, — *Kittatiny* and *Wilson's* Early Blackberries, — *Cherry* and *White* Grape Currants, — considerations that should influence the purchaser in the choice of Nursery Stock; Select Lists, both by Mail and Express; — the secrets of our success in plant, vine and fruit growing; — Prices of Stock for Spring of 1888, and much valuable information in reference to Small Fruit Culture.

We will enclose with the above Catalogue a directed Envelope and an Order List, giving the plainest instructions how to order, and forward to all applicants enclosing 10 cts.

J. KNOX,

Box 155, Pittsburgh, Pa.

The New Cabbage!

Fottler's Improved Brunswick Cabbage is a great acquisition, it being a new and larger sized than any other hard heading drumhead variety yet offered to the public. The Boston Market Gardeners have adopted it. It is remarkably short stemmed, very reliable for seed and perennate. It is about ten days earlier than any stone Mason, and the head attains a diameter of from 12 to 18 inches. It is remarkably short stemmed, very reliable for seed and thrives finely under ordinary cabbage cultivation. Give them a fair chance and hardly a plant to an acre will fail to mature a fine head. I have grown it for two years and fully tested it.

My seed is from the stock of Mr. Fottler, the original grower, and is warranted pure. Price, sent post-paid to any address, 25 cents per package, or five packages for \$1.00. For sale by the package only this season, next year I shall have it for sale by the pound as I have laid in a fine lot of heads and small cored largely. Send for Seed Catalogue. I grow over 100 varieties of garden seeds and import many sorts from France and England.

JAMES J. H. GREGORY, Marlborough, Mass.

150 Acres planted in Small Fruits. A good stock of plants for sale, wholesale or retail. Send and get list of prices for spring '88. JNO. S. COLLINS, Moorestown, N. J.

ORANGE JUDD & CO.,
245 Broadway, New York.THE AMERICAN
HORTICULTURAL ANNUAL

For 1868.

A YEAR-BOOK

FOR EVERY HOME.

The second number of this serial is now ready. It will contain a popular record of horticultural progress during the past year, besides valuable articles from

EMINENT HORTICULTURISTS.

Among those who contributed to its pages are

HON. MARSHALL P. WILDER.

PETER HENDERSON,

THOMAS MEEHAN,

JOSIAH HOOPES,

WM. S. CARPENTER,

GEORGE W. CAMPBELL,

DOCTOR VAN KEUREN,

DOCTOR JOHN A. WARDER,

S. B. PARSONS,

JAS. J. H. GREGORY,

GEORGE SUCH,

ANDREW S. FULLER,

JOHN SAUL,

JAMES VICK, and

other well known pomological and floricultural writers.

The engravings, which have been prepared expressly for the work, are numerous, and make it the

MOST BEAUTIFULLY ILLUSTRATED

work of its kind ever published in this or any other country. It contains Tables, Lists of Nurserymen, Seedsmen, and Florists, and other useful matters of reference. Sent post-paid. Price, fancy paper covers, 50 cts.; cloth, 75 cts.

ORANGE JUDD & CO.,
245 Broadway, New York.

COPELAND'S COUNTRY LIFE.

A COMPENDIUM OF
AGRICULTURAL & HORTICULTURAL
Practical Knowledge.

By ROBERT MORRIS COPELAND.

It contains 926 large Octavo Pages and 350 Engravings, and embraces Descriptions, Hints, Suggestions and Details of great value to those interested in Country Life. The following are some of the matters of which it treats:

DRAINING.
CATTLE.
SHEEP.
SHRUBS.
FRUITS.
FLOWERS.
VEGETABLES.
HOT-HOUSE PLANTS.
GRAPE CULTURE.
ORNAMENTAL TREES.

The Kitchen Garden receives particular attention. In short, as its name indicates, the book treats of almost every subject that needs consideration by those living in the country, or having anything to do with the cultivation of the soil.

SENT POST-PAID, PRICE, \$5.00.

ORANGE JUDD & CO.,
245 Broadway, New-York.THE AMERICAN
AGRICULTURAL ANNUAL

For 1868.

A YEAR-BOOK

WANTED BY EVERYBODY.

This volume is now ready, and contains much of interest to every agriculturist. Besides the general record of agricultural progress, it will contain a valuable article on

Factory Dairy Practice,

By GARDNER B. WEEKS, Esq., Secretary of the American Dairymen's Association, in which he discusses the reasons for the best practice and the most approved apparatus, buildings, etc., fully illustrated, and is equally interesting to the practical dairymen and to the novice.

Sewers and Earth Closets

In their relations to Agriculture, by Col. GEO. E. WARING.

Winter Wheat,

Describing, with engravings, new and valuable varieties, by JOSEPH HARRIS and JOHN JOHNSTON;—one upon

Scythes and Cradles,

By JOHN W. DOUGLAS, (fully illustrated;) also articles on Horse Breaking and on Biting Colts, by SAM'L F. HEADLY, Esq., (illustrated;) on Recent Progress in Agricultural Science, by Prof. S. W. JOHNSON; on Commercial Fertilizers, Veterinary Medicine and Jurisprudence, Progress of Invention Affecting Agriculture. Valuable Tables for Farmers and others, etc.

It is intended that the work shall be practical, excellent in the beauty of its illustrations, and in its adaptation to the wants of American Farmers, superior to anything of the kind heretofore published.

In its general features it will be like the Agricultural Annual for 1867, containing an Almanac and Calendar, and there will be added a list of dealers in Agricultural Implements, Seeds, etc. Sent post-paid. Price, fancy paper covers, 50 cts.; cloth, 75 cts.

Premium Circular of THE METHODIST: AN EIGHT-PAGE WEEKLY NEWSPAPER. Religious & Literary.

Terms to Mail Subscribers, Two Dollars and Fifty Cents per Year, in advance. Postage prepaid at the post-office received, Twenty Cents per year. Twenty Cents must be added by Canada subscribers to prepay postage.

Office 114 Nassau-st., New York.

PREMIUMS TO CANVASSEES!

The Publishers of the *Methodist* enter upon the canvass for new subscribers for 1897, with the determination to make it the interest of all to engage in the work. As inducements to those who will engage in getting up clubs, they propose the following premiums:

I.—PERIODICALS.

Two Newspapers for \$3.

A PREMIUM FOR YOUTH PEOPLE.

For \$3 we will send *The Methodist* and *The Riverside Magazine for Young People* to any subscriber for One Year.

For \$5 we will send *The Methodist* and the *Ladies' Repository* to January 1st, 1897.

For \$5 we will send *Harper's Illustrated Weekly*, *HARPER'S MONTHLY MAGAZINE*, or *THE BAZAR*, and the *Methodist*, to any subscriber for One Year.

The above offer applies to either new subscribers or old subscribers renewing their subscriptions and sending direct to this office.

II.—BOOKS.

For 2 Subscribers, at \$2.50 each, *Prayers from Plymouth Pulpit*, sent post-paid. 1 vol., cloth binding, beveled edge, Price, \$1.75.

For 4 Subscribers, at \$2.50 each, *The Resurrection of the Soul*, and *The Resurrection of the Body*, in two volumes, by Rev. H. Mattison, D.D. About 400 pages each.

For 5 Subscribers, the first vol. of McClintock & Strong's *Cyclopedia*, a complete Biblical, Theological, Ecclesiastical, and Biographical Dictionary of nearly one thousand pages, with numerous illustrations. Price, \$5 in cloth binding.

For 8 Subscribers the same, in full sheep binding. Price, \$5. For 8 Subscribers, the same, in half morocco. Price, \$5. All the remaining volumes will be furnished on same terms as soon as published.

For 8 Subscribers, at \$2.50 each, Webster's *New National Vocabulary Dictionary*, 1000 pages, and over 600 engravings, in sheep binding.

Postage prepaid by us on all the above, except the *Cyclopedia*. That being too large to send by mail, will be sent by any Express Company indicated, at the expense of the persons receiving it.

III.—GOLD AND SILVER WATCHES.

FROM BENEDICT BROTHERS.

For 28 Subscribers, at \$2.50, a Fine Solid Silver Hunting-Case Full-Jewelled Patent Lever Watch, Arnold Adams, London. Price, \$3.

For 10 Subscribers, at \$2.50, an elegant American Waltham Watch. Solid Silver Hunting-Case, Expansion Balance, Four Holes Jewelled, P. S. Bartlett. Price, \$3.

For 60 Subscribers, a Fine Solid Gold Full-Jewelled Hunting-Case Lady's Watch, beautifully enamelled. Price, \$5.

For 110 Subscribers, an elegant Solid Gold American Waltham Watch, Full-Jewelled, Patent Lever, Hunting-Case. Price, \$10.

These Watches are from the well-known establishment of Messrs. Benedict Brothers, keepers of the city time, and are put up ready for shipment, and guaranteed by them. The prices named are the lowest New York retail prices, and are much lower than the same styles retail in many other cities.

IV.—SEWING-MACHINES.

An Exclusive Premium for any Family.

All the machines come from the best makers, and direct from their manufacturing. They are carefully boxed and delivered to any railroad or express company in this city.

For 25 Subscribers, at \$2.50 each, a No. 3 Wheeler & Wilson Sewing-Machine. This style will sew all kinds of fabrics.

For 25 Subscribers at \$2.50, a No. 1 Willcox & Gibbs Machine, with Hemmer and Feller.

For 25 Subscribers, a Grover & Baker Sewing-Machine, No. 22.

For 25 Subscribers, at \$2.50, a No. 1 Florence, price, \$3. Makes the Single Lock and the Single Knot Stitch. Price, \$3.

For 28 Subscribers, a Letter "A" I. M. Singer & Co. Sewing-Machine.

For 28 Subscribers, a No. 21 Grover & Baker Sewing-Machine, with Cover, Lock and Drawer.

For 10 Subscribers, at \$2.50, a No. 2 Florence Sewing-Machine, with Drawer and Cover. Makes all four stitches—Single & Double Lock, Single & Double Knot, Price, \$5.

For 30 Subscribers, at \$2.50, the Elias Howe Sewing-Machine, Letter "A." This Machine is perfectly adapted for Family Sewing; also used extensively for Manufacturing purposes.

For 45 Subscribers, at \$2.50, No. 3 Florence, Silver mounted, makes all four stitches, heavy Half-case, Lock, and Drawer.

For 55 Subscribers, at \$2.50 each, a No. 5 Florence Sewing-Machine, price, \$2. This style has a beautiful heavy case, and is highly ornamented.

For 75 Subscribers at \$2.50 each, a No. 6 Florence Sewing-Machine, in Full Case, Solid Walnut. This style combines beauty and convenience, making an elegant piece of Furniture when closed, and also securing the Machine from dust and improper meddling. Price, \$15.

For 100 Subscribers, a No. 6 Florence, in Rosewood Full Case. This is the finest style on the catalogue of the Florence Machine Co. Price, \$150.

V.—ESTEY'S ORGANS.

For Churches, Sunday-Schools, and the Parlor.

For 50 Subscribers, at \$2.50 each, a Ten-Octave Cottage Organ, Walnut Case. Price \$100.

For 65 Subscribers, at \$2.50, a Four-Octave Double-Reed Organ, Walnut Case, one stop.

For 75 Subscribers, \$2.50 each, a Five-Octave Double-Reed Organ. Price \$120.

For 95 Subscribers, at \$2.50, a Five-Octave Double-Reed Organ, one stop. Price \$180.

For 115 Subscribers, at \$2.50, a Five-Octave Organ, Walnut Case, with Harmonic attachment, 2 stops. Price \$280.

For 125 Subscribers, a No. 21 Estey Organ, Five-Octave Double-Reed, Walnut Case, Harmonic Attachment, and Manual Sub-Bass, three stops. Price \$350.

For New York city subscribers, served by carrier, 50 cents on each subscriber must be added to all the above rates.

Subscribers in the Canadian Provinces must add 20 cents to prepay postage.

The way is now open. Commence at once. The better way is to send in the names as fast as obtained, in order that they may be entered on our books and the papers forwarded to them. Those who canvass for premiums will please state in their letters "ON PREMIUM ACCOUNT." Those canvassers who prefer a commission in cash instead of a premium, can avail themselves of our conditions, which are exceedingly liberal, and will be made known on application by mail.

25¢ Premiums are forwarded on the completion of clubs and receipt at our office of money for the same.

25¢ Specimen copies sent free.

GET THE BEST
WEBSTER'S DICTIONARY
UNABRIDGED
NEW ILLUSTRATED
OVER 3000 FINE ENGRAVINGS.

10,000 Words and Meanings not in other Dictionaries.

A necessity to every intelligent family, student, teacher, and professional man. What Library is complete without the best English Dictionary?

"Superior in most respects to any other English Dictionary known to me."—*Rev. George H. Morsh.*

All young persons should have a standard Dictionary at their elbows. And while you are about it, GET THE BEST; that Dictionary is NOAH WEBSTER'S—the great work unbridled. If you are too poor, save the amount taken off of your back put it into your head."—*Phrean Journal.*

Every farmer should give his sons two or three square rods of ground, well prepared, with the seeds of wheat they may buy bit. Every mechanic should put a revolving loom in some conspicuous place in the house to catch the sight penalties for the idle person. It is a great labor-saver. It has saved as time enough in one year's use to pay for itself, and that must be deemed good property which will clear itself off at once. *—New York Herald.* Also Royal Quarto Index. Published by G. & C. MERIAM, Springfield, Mass. Sold at all Bookstores. Also by mail, send \$1.00, and receive WEBSTER'S DICTIONARY, 1000 pages, Octavo. PRICE 85.

A VERY DESIRABLE DWELLING

Only 50 minutes from the center of business in New York City, easily reached 10 times a day.

Has the advantages of the Country, and yet all the conveniences of a City House—GAS; BATH ROOM; HOT and COLD WATER in other rooms; Kitchen with Stationary Wash-tubs, etc.; fine Cellar; Coal Room; beautiful double Drawing Room or Parlor; smaller Parlor or Sitting-Room; Dining-Room with Closet, and China or Silver Wash Sink; Hat and Cloak Closet in Hall; nine fine Sleeping Rooms, etc.

All the House heated by Furnace. Plumbing and Heating Apparatus of first quality.

Spacious Piazzas, Grape Arbor, etc.

House erected during the Summer of 1867, and in first-rate style and workmanship, and of the best Materials, with many conveniences not usually found in houses of the same value. It is all ready for immediate occupancy.

Location High and very Healthful—7 minutes walk from the R. R. Depot, with good sidewalks. In convenient walking distance of Churches and first-rate Schools.

Lot on the corner, 100 feet on one street, and 117 feet on the other.

Taken altogether, this is one of the most desirable residences around New York.

Terms: \$9,800, (no discount,) of which a large portion may remain on Bond and Mortgage for a term of years.

Apply personally or by letter to

Rev. E. B. DRAKE,

at Office of Agriculturist, 245 Broadway, N. Y.

PEACH GROWERS' CO.

500 ACRES HAVE BEEN SECURED—more, if wanted—in improved Farms, with dwellings adjacent to Ridgeley, a Station on Maryland & Delaware R. R., in Carroll County, Md., to be hereafter planted with choice Peach Trees, by a Company now organizing in NEW YORK, with a view to marketing the Fruit. The means and incident measures are entrusted to gentlemen of indisputable integrity. Capital fixed at \$100 per acre—not more—for land, culture and expenses, till productive: then expected to yield, at the lowest, \$1 per tree, or \$20 per acre, and progressively more—a good and safe investment, large or small, in city or country. For **SHARES OF \$10** or exorbitant Circular, with references, if desired, apply to either of the following gentlemen:

Rev. B. B. DRAKE, 245 Broadway, (1st. Office.)
J. H. CORSEKILL, Office of N. Y. Life Ins. Co., 210 N. 4th St.
RILEY A. BRICK, 169 Leonard-street,
New York, December, 1867.

THREE or FOUR NOVELS for NOTHING.—The cheapest way to secure three or four of the best and latest popular Novels is to subscribe for THE NEW YORK SEMI-WEEKLY TRIBUNE, which publishes each year three or four of the best Novels. Price four dollars. The paper is richly worth the subscription price, so that subscribers really get the Novels for nothing. Address THE TRIBUNE, New York.

Short-Hand without a Master, by which the art of taking down Sermons, Lectures, Speeches, Trials, etc., may be attained in a few hours. Fifty-fourth edition, WITH SUPPLEMENT. Price 25 cents. Send orders to O. A. ROORBACH, 122 Nassau-st., New York.

JUCUNDA—OUR NO. 700 STRAWBERRY.

"The largest Strawberries seen in this market during the present season, and probably the finest ever sent here for sale in quantity, were some of our Jucunda, sent by the Rev. J. KNOX, of Pittsburgh, Pa. They were extremely large—12 to 15 berries filling a box—of a bright color, and so firm, after their journey of 400 miles, that they might readily be shipped as much farther."

New York Tribune.

Send 10 cts. for **Small Fruit Catalogue**, giving full description, and see prices. See *Agriculturist*, page 34, for price of plants. **Order Early.**

**J. KNOX,
Box 155, Pittsburgh, Pa.**

The TREMONT WATCH CO. manufacture the only DUST-PROOF Watch movement in this country. They have a branch establishment in Switzerland, under the personal superintendence of Mr. A. L. DENNIS, (the ORIGINAL of the American system of watch-making), where they produce their Balances and Escapements of a superior quality. The cheap skilled labor of Europe, working thus on the AMERICAN SYSTEM, enables them to offer a superior article at a low rate.

"I LIKE IT MUCH."—This is what Mr. Quinn says of the HARRISON BEE-FEEDER. If you would save your bees over winter, send \$2.50 for six feeders. EDWARD HARRISON, Springfield, Ohio.

THE PERPETUAL (WATCH CHARM) CALENDAR—size of a two cent piece—with plain, massive and temperance emblems, needed by everybody everywhere. Price by mail, electroplate, plain, with enameled figures and letters, 30 cents; gold, with emblem, ditto, \$1.50. Address

E. MADEN, 161 Broadway, Room 3, New York, P. O. Box 5575. Active Agents wanted everywhere.

Worth Your Attention. If you desire the controlling manufacture of the best cheap Fruit Box ever invented—a new thing—address A. M. WARD, New Britain, Conn.

PROSPECTUS OF

The Evening Post,

The **Evening Post**, which began with the century, and now over sixty-seven years of age, does not intend to grow sluggish and supine with the advance of years, but to rival in vigor, enterprise, and the intelligence the most active of its contemporaries. Its editorial department shall be as ably organized and as energetically conducted as it ever has been; our telegraphic reports, both by the Atlantic Cable from abroad and by the various domestic lines from Washington, Albany, the East, the West and the South, shall be as full as they can be made; our city and country news shall be as various and interesting as the events admit; our correspondence from Europe and the principal home cities will be improved and increased; while our agricultural, commercial, shipping, market and other reports shall be as trustworthy and complete as industry and the expenditure of money can make them. We have the means, through the generous and unobtrusive patronage of our friends, of rendering our journal the equal of any in the world, and we have the ambition of doing so, as rapidly as the progress of business and the taste for newspaper literature will justify additional attempts.

It is understood, we suppose, that while the **Evening Post** aims to be primarily a newspaper in which the current events of world-history, political, commercial, scientific, social, literature, and the arts, are placed at its head, it is also emphatically a political paper. It cannot separate itself from the life of our times, and particularly from the life of our country, and it must discuss questions of public interest with all the earnestness, all the intelligence, all the force that it can muster and their importance may seem to demand.

ITS CREED.

What its principles in politics are, have been long known. They may be summed up in few words: National Unity; State Independence, and Individual Freedom and Equality of Rights. The perpetuity and supremacy of the Union, as the guaranty of our national strength and glory; the Independence of the States, in all their local affairs, as the guaranty against an oppressive and dangerous centralization; the Freedom as the "sovereignty of the Individual, without regard to high or low position, or to the position of all government, and the sacred means of social development, personal happiness and national progress.

These are our general principles, but in the application of them we shall insist upon the honorable payment of our public debts; the retrenchment of expenditures; the most rigid economy of administration; impartial taxation; and integrity and exactness, not partisan service, as the grounds of appointment to office. We hold that the supreme end of all government is to define, decree and execute justice among all its members. All partial laws are illegitimate; all special privileges a wrong; all interference with the natural development of industry, and an unrestricted exchange of the fruits of that industry, an usurpation of power and a pernicious impertinence. We believe, too, that every member of society who contributes to its support, in its defence, should be progressively admitted to a participation in its political control. In other words, equal rights, impartial laws, freedom from unjust and unnecessary constraints, and universal suffrage, are our mottoes now, as they have been our mottoes in the past, and, as we trust, they will be our mottoes in the future.

SEND AT ONCE.

As there is usually a great crowd pressing to have their subscriptions recorded about the first of January, some are necessarily delayed, but this might be avoided by sending on the subscription in time.

Any reader of this paper having friends who may not be familiar with the character or merits of the **Evening Post**, will be supplied with specimen copies without charge, by sending the request to the address below.

THE EVENING POST, CLUB RATES, &c.

TERMS TO MAIL SUBSCRIBERS:

Only 25c.

FOR a whole year's subscription to **HANEY'S JOURNAL**, a neatly printed monthly paper for the Farm, Workshop, Store and Household. It is different from all other periodicals, and the price is so low that all can afford it without giving up any other paper. Its contents are mainly useful and profitable matter comprising New Arts and Discoveries, valuable Practical Recipes, Profitable Trade Secrets, Money Making Manufactures, Useful and Lucrative Employment, Helps for Housekeepers, and enriens, instructive, and entertaining reading. Though not a large paper, we intend to circulate it as widely as possible, and we are confident that every reader will profit by its investment. An interesting department will be devoted to the exposure of Swindlers and Humbugs, under the charge of the author of the celebrated and widely-circulated book, "Hoaxes and Logicians." Also an interesting and instructive series, "The Rich Men of the World, and How they Gained their Wealth."

HANEY'S JOURNAL will consist of eight pages, neatly printed and moderately illustrated. Only 25 cts. a year, single copy 5 cts. Samples sent post-paid on receipt of price—none free. We feel sure nearly all will be pleased with **HANEY'S JOURNAL**, but possibly some will not. Therefore we say—send along your subscriptions and if you are not perfectly satisfied on receipt of first No., we will return your entire subscription money. Or if you prefer send 5 cts. for sample before subscribing.
Among the Contents of January No. will be found: How Bonner built up the New York Ledger; Queer Fables—walking, leaping, flying, climbing, talking, the fishes; Modern Physic; Decemury; Japan; the Islands; Turkey; Training for Health and for Athletic Contests; How to Pounce Blinde Chess for the Blind; Yonast's Cure for Hydrophobia; Wasteful Advertising; Art of Weather Judging; How People see Ghosts; Maple Sugar Making; Scientific Apparatus; Silver Mounting; Rosewood Prize Hats, Toys, &c., have been distributed free among those sending correct answers to the Regular Monthly Prize Puzzle—see last No.

HUNDREDS OF DOLLARS

In Cash, besides many Valuable and Attractive articles, such as Skates, Field and Parlor Croquet, Printing Press, Address Machine, Scientific Apparatus, Silver Mounting, Rosewood Prize Hats, Toys, &c., have been distributed free among those sending correct answers to the Regular Monthly Prize Puzzle—see last No.

MERRYMAN'S MONTHLY.

and we intend to be equally liberal in future. Competition open to all. The best illustrated family magazine of the important events of the month, and the best of a copy.
We will send four different numbers of the **Monthly** post-paid, to any place where there is no news agent or only one, and will allow a profit, with hints for securing an excellent opportunity to secure a stock of good reading for a trifling sum.

We also publish the following Attractive Books which we will send post-paid on receipt of price:

Guide to Authorship, a practical and valuable aid to all who wish to engage in Literary Pursuits of any kind, and to all who wish to gain a knowledge of success, preparation, value, and disposal of MS. Also, Art of Editing, Proof-reading, technical terms, estimates for publication.

"It will save them asking a great many questions, or making a great many blunders."—*Am. Jour.*—"Will be of great service to those who contemplate a trial of the pleasures and pains of a literary life."—*Godey*.—"Useful to all, old and young, who write for the press."—*Phet. Jour.*—"Were the instructions in this little work carried out, they should have more writers, and fewer scribblers."—*Yankee Blade*.—"Gives the reader interesting details of the techniques of literary handicraft."—*N. Y. Tribune*.

Secrets Worth Knowing, tells how to make medicine, perfumery, toilet and dental articles, cosmetics, soap, and all the various candies, waxes, cordials, cheap and delicious temperance beverages, veterinary remedies, manufacturers' secrets, and many articles in universal use, made at trifling cost and sold at large profits. 25 cts.

Rogues and Rogueries, new, revised and enlarged edition, exposing all tricks and traps of evil-doers, all swindles and humbugs. Interesting and instructive. Illustrated. 25 cts.

Phonographic Handbook, for Self-Instruction in the modern, improved, and simplified art used by practical reporters. Easiest and best. 25 cts.

Handbook of Ventriologism, and how to make the human voice utter any words or sentences. "Really a valuable aid."—*Boston Wide World*.—"Will enable any one to produce the most wonderful vocal illusions."—*N. Y. Tribune*.

How to Make Bad Memory Good and Good Better, a new art valuable to all teaching how the most wonderful facts of memory may be performed, and how all defects of memory may be remedied. Useful to all, especially students (particularly when preparing for examination), teachers, clergymen and all professional men. 15 cts.

Common Sense Cook Book, a reliable guide for the preparation of a wide range of dishes and all the various and popular ones. The detailed attention the number of delicious but inexpensive preparations which are included in it. It is free from those errors so common in the cooking in many of our high priced books, and the proportions of ingredients are carefully given, as well as the most reliable and successful recipe. The book contains a very large amount of matter for the price, and even if you already possess a good cook book, you cannot fail to find many things in this one simply worth the price. 30 cts.

Orpheus C. Kerr's Comicalities, with 150 humorous illustrations. 25 cts.

Grant Songster, new, humorous, and sentimental songs for clubs and the campaign, words arranged to well-known singing tunes, and adapted to solo and part singing. 10 cts.

Handbook of Dominoes, including all the popular European games, and all the new ones. Illustrated. 15 cts.

Home Recreations, a collection of delightful pastimes, games, puzzles, magical, optical, and other amusements, and numerous diversions for the home circle and juvenile parties. Illustrated. 25 cts. (to March). We have also published two charming stories, containing an amount of reading matter equal, by actual measure, to ordinary 25 cent novels, liberally illustrated, with

we sell at 15 cts. each, or both for 25 cts. each—**Carmie, the Creole Spy**, a tale of Tennessee during the war—**Driftwood**; or, **The Swamp Specter**, a story of the celebrated "Red River Expedition," and nothing of an immoral tendency. Good as well as cheap.

Make the annexed diagram with three strokes of the pencil without rubbing out any lines or going over any line twice. It is a very simple and easy test of the eye. See illustration in **Merryman's Mammoth** collection of our best Illustrated Dollar Price Puzzles, Pictorial Tebbases, Puzzle Pictures, Magic Webs, and the New Game of Castle Croquet. 15 cts.

The above are sold by the principal Booksellers and Newsdealers, and if they are in your vicinity we prefer you should get them of the local dealer. If this is not convenient however, orders may be sent direct to us at any time (as we are permanently located). They will be promptly forwarded. All orders must be accompanied by the Dealers supplied by all Wholesale Dealers, or the **AMERICAN NEWS CO.**, New York.

We shall at any time be pleased to have persons call at our place of business and examine any of our publications without feeling obliged to buy if they do not desire to.

Remember name and location—

HANEY & CO., 119 Nassau-st., New York.

Just Published

A NEW WORK ON APPLES.

AMERICAN POMOLOGY.

APPLES.

By Doct. JOHN A. WARDER,

PRESIDENT OHIO POMOLOGICAL SOCIETY; VICE-PRESIDENT
AMERICAN POMOLOGICAL SOCIETY, ETC.

293 Illustrations.

To pomologists a work by Dr. Warder will need no commendation. Though a citizen of Ohio, he is so sure to be at any pomological gathering, be it East or West, that the whole country claims him, and if any one has a right to entitle his work *American Pomology* it is certainly Dr. Warder. The present is the first instalment of a work intended to cover the whole ground. In it the author has attempted the difficult task of bringing apples into something like order.

This volume has about 750 pages, the first 315 of which are devoted to the discussion of the general subjects of propagation, nursery culture, selection and planting, cultivation of orchards, care of fruit, insects, and the like; the remainder is occupied with descriptions of apples. With the richness of material at hand, the trouble was to decide what to leave out. It will be found that while the old and standard varieties are not neglected, the new and promising sorts, especially those of the South and West, have prominence. A list of selections for different localities by eminent orchardists is a valuable portion of the volume, while the Analytical Index or *Catalogue Raisonné*, as the French would say, is the most extended American fruit list ever published, and gives evidence of a fearful amount of labor.

This differs from any fruit book heretofore published in this country, in its complete classification of apples. The author gives the principal European systems and modestly puts forth his own to be tested by practice. He divides apples into four classes, according to their forms. Each of these classes is sub-divided by other obvious characters, and it would seem that any apple described in the book might be easily identified. We trust that this will prove a great help to the pomologist.

Fruit-growers will welcome this book as a valuable and long-wished for addition to pomological literature, and it will be found equally useful to the novice and the experienced orchardist. The work has 293 Illustrations, is printed on good paper and well bound.

A NEW WORK.

GARDENING FOR PROFIT,

IN THE MARKET AND FAMILY GARDEN.

BY PETER HENDERSON.

Illustrated.

This is the first work on Market Gardening ever published in this country. Its author is well known as a market gardener of eighteen years' successful experience. In this work he has recorded this experience, and given without reservation the methods necessary to the profitable culture of the commercial or

MARKET GARDEN.

It is a work for which there has long been a demand, and one which will commend itself, not only to those who grow vegetables for sale, but to the cultivator of the

FAMILY GARDEN

To whom it presents methods quite different from the old ones generally practiced. It is an

ORIGINAL AND PURELY AMERICAN

work, and not made up, as books on gardening too often are, by quotations from foreign authors.

Everything is made perfectly plain, and the subject treated in all its details, from the selection of the soil to preparing the products for market. Frames, Hot-beds, and Forcing Houses, the management of which is usually so troublesome to the novice, are fully described, and the conditions of success and causes of failure clearly stated.

The success of the market gardeners near New York City is proverbial, and this is the only work that sets forth the means by which this success has been attained. Valuable hints are given to those who would raise Vegetables at the South for northern markets.

The following synopsis of its contents will show the scope of the work:

Men Fitted for the Business of Gardening.
The Amount of Capital Required and Working Force per Acre.

Profits of Market Gardening.

Location, Situation, and Laying Out.

Soils, Drainage, and Preparation.

Manures, Implements.

Uses and Management of Cold Frames.

Formation and Management of Hot-beds

Forcing Pits or Green-houses.

Seeds and Seed Raising.

How, When, and Where to Sow Seeds.

Transplanting, Insects.

Packing of Vegetables for Shipping.

Preservation of Vegetables in Winter.

Vegetables, their Varieties and Cultivation.

SENT POST-PAID.

PRICE, \$1.50.

PRICE \$1.50

ORANGE JUDD & CO.,
245 Broadway and 41 Park Row, N. Y.

A NEW BOOK. THE GRAPE VINE.

By FREDERICK MOHR,
DOCTOR OF PHILOSOPHY AND MEDICINE.

Translated from the German, and accompanied with
Hints on the Propagation and General Treat-
ment of American Varieties.

By HORTICOLA.

This work is mainly devoted to the most elementary matters. It explains the structure and mode of growth of the vine so clearly that no intelligent person who reads it need be in doubt what to do with his vines. It has been well translated, and a chapter on the propagation of American varieties has been substituted for the original one on multiplying the European grape. As anatomy is the foundation of surgery, so is a knowledge of the structure of the vine to the vine dresser. In both cases it is as important to know when and where to cut, and how.

CONTENTS.

Development and Structure of the Grape Vine.
The Node; The Branch; Reasons for Pruning; Training.
Training on Trellises; Treatment in Summer; Plantations.
Vines Trained along the Garden Walk.
Trellises on Walls; Tree Trellises.
Vines Trained to Trellises; Bronn's Method.
Time Required for Covering a Trellis.
Manuring the Vine; Age of Vineyard.
The Rising Sap in the Vine; The Grape Disease.
Treatment of Vines Injured by Frost.
Impléments; Proper Time to Perform Work on the Vine.
Constituents of the Vine and their Distribution.
Propagation of the Vine: By Layers; By Cuttings; By Grafting; By Inarching; By Seeds.
Hybridization.

American Varieties—General Management; Planting; Pruning; Pinching; Covering in Fall.

SENT POST-PAID. PRICE, \$1.00.

ORANGE JUDD & Co.,
245 Broadway and 41 Park Row, N. Y.

A NEW WORK. SMALL FRUIT CULTURIST.

By ANDREW S. FULLER.

PRACTICAL HORTICULTURIST, RIDGEWOOD, BERGEN CO., N. J.

A new work, and the only one devoted to Small Fruits. Special treatises of this kind have the advantage that the author can more thoroughly discuss his subject, and go into greater detail, than in a work embracing both large and small fruits. The work covers the whole ground of Propagation, Culture, Varieties, Packing for Market, etc.

CONTENTS: INTRODUCTION—I. BARBERRY—II. STRAWBERRY—III. RASPBERRY—IV. BLACKBERRY—V. DWARF CHERRY—VI. CUNNANT—VII. GOOSEBERRY—VIII. CORNELIAN CHERRY—IX. CRANBERRY—X. HUCKLEBERRY—XI. SWEETGUM—XII. PREPARATION FOR GATHERING FRUIT.

We predict that this work will bring Mr. Fuller many enemies, as he has given his opinion about varieties without reserve. On the other hand it will be more strongly endeared him to all true lovers of horticulture, as these wish to have the merits of fruit given without reference to the persons who introduce them.

While very full on all the small fruits, the Currants and Raspberries have been more carefully elaborated than ever before, and in this important part of his book, the author has had the invaluable counsel of Charles Downing. The chapter on gathering and packing fruit is a valuable one, and in it are figured all the baskets and boxes now in common use. The book is very finely and thoroughly illustrated, and makes an admirable companion to his Grape Culturist.

DRAINING FOR PROFIT

AND

DRAINING FOR HEALTH.

By GEO. E. WARING, JR.,

ENGINEER OF THE DRAINAGE OF CENTRAL PARK, NEW YORK.

Illustrated.

TABLE OF CONTENTS:

LAND TO BE DRAINED AND THE REASONS WHY.—Indications of the need of draining.—Sources of water.—Objections to too much water.—Wet sub-soil.

HOW DRAINS ACT AND HOW THEY AFFECT THE SOIL.—Characteristics of well laid tile drain.—Surface-water and rain water beneficial, springs and soakage water injurious.—Cracking of stiff clays.—Evaporation and filtration.—Rain fall.—Evaporation.—Temperature.—Drought.—Porosity or mellowness.—Chemical action in the soil.

HOW TO GO TO WORK TO LAY OUT A SYSTEM OF DRAINS.—Amateur draining.—Maps.—Levelling instruments.—Outlets and location of drains.—Main drains.—Spring water.—Fall.—Tiles.—Depth and distance apart.—Direction of laterals.—Collars.—Discharge of water from drains.

HOW TO MAKE THE DRAINS.—Tools.—Marking the lines.—Water courses.—Outlet.—Silt Basins.—Opening the ditches.—Grading.—Tile laying.—Connections.—Covering the tile and filling in.—Collecting the water of springs.—Amending the map.

HOW TO TAKE CARE OF DRAINS AND DRAINED LAND.—Removing obstructions.—Mistake of substituting large tiles for small ones which have become obstructed.—Heavy lands should not be trampled while wet.

WHAT DRAINING COSTS.

Draining, expensive work.—Their permanence and lasting effects.—Cheapness versus economy.—Details of cost.—(1. Engineering and Superintendence.—2. Digging the ditches.—3. Grading the bottoms.—4. Tile and tile laying.—5. Covering and filling.—6. Outlets and Silt Basins.)

WILL IT PAY?

Increased crops required to pay cost of draining.—(Corn, Wheat, Rye, Oats, Potatoes, Peas, Hay, Cotton, Tobacco).—Instances of profit.—Benefit of draining in facilitating farm work.

HOW TO MAKE DRAINING TILES.

Materials.—Preparation of earthen.—Moulding tile machines.—Drying and rolling.—Burning.—Kilns.—General arrangement of a tiler.

THE RECLAIMING OF SALT

MARSHES.—Extent of marshes on the Atlantic Coast.—The English Fen.—Havre de Grace.—The exclusion of sea water.—Removal of the causes of inundation from the upland.—Removal of rain fall and water of filtration.—Embankments.—Muskrats.—Rivers and Creeks.—Outlet of drainage.

MALARIAL DISEASES.

Fever and Ague.—Neuralgia.—Vielinity of New York.—Dr. Bartlett on Periodical Fever.—Dr. Metcalf's Report to U. S. Sanitary Commission.—La Roche on the effects of Malarial Fever.—Dr. Salisbury on the "Cause of Malarial Fevers."—English experience.—Reports to the British Parliament.—Cause of Malaria removed by draining.

HOUSE AND TOWN DRAINAGE.

Sewerage.—The use of pipes.—The new outfit sewers in London.—The use of steam pumps to secure outlets.—Utilization of sewage matters in agriculture.—Effects of imperfect house drainage on health.—Typhoid fever.—The Westminster fever in London.—Epidemic at the Maplewood Young Ladies Institute in Pittsfield, Mass.—Lambeth Square, London.—Back drainage.—Water supply.—General Board of Health, (England).

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY

HAVE JUST RECEIVED
**TWO FULL CARGOES
OF THE FINEST NEW CROP TEAS.**

22,000 HALF CHESTS by ship *Golden State*.
12,000 HALF CHESTS by ship *George Shotton*.

In addition to these large cargoes of Black and Japan Teas, the Company are constantly receiving large invoices of the finest quality of Green Teas from the Moyne district of China, which are unrivaled for fineness and delicacy of flavor.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out the account entirely the profits of the Chinese factors.

1st. The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d. The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d. The Importer makes a profit of 50 to 59 per cent, in many cases.

4th. On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1000 to 2000 packages, at an average profit of about 10 per cent.

5th. The Speculator sells it to the Wholesale Tea Dealer in lots at a profit of 10 to 15 per cent.

6th. The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th. The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th. The Retailer sells it to the Consumer for ALL THE PROFIT IN HIS CASE.

When you have added to these FRONT PROFILES as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, and with the exception of a small commission, paid for purchasing to our correspondents in China and Japan, one cent each, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, our customers in all parts of the United States can receive their Tea at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

Some parties inquire of us how they shall proceed to get up a Club. The answer is simply this: Let each person wishing to join in a Club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in circulars. Write the names, kinds, and amounts plainly on the list as given in the Club Order published below, and when the Club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation the members can divide equitably among themselves.

Parties sending Club or other orders for less than thirty dollars had better send Post-office Drafts or money with their orders, to save the expense of collections by express; but larger orders we will forward by express to collect on delivery.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for Clubs less than \$30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OOLOONG (Black), 70c, 80c, 90c, best \$1.25 lb.
MIXED, (Green and Black), 70c, 80c, 90c, best \$1 per lb.
ENGLISH BREAKFAST (Black), 80c, 90c, \$1, \$1.10, best \$1.20 per pound.
IMPERIAL (Green), 80c, 90c, \$1, \$1.10, best \$1.25 per pound.
YOUNG HYSAN (Green), 80c, 90c, \$1, \$1.10, best \$1.25 per pound.
UNCOLORED JAPAN, 90c, \$1, \$1.10, best \$1.25 per pound.
GUNPOWDER, (Green), \$1.25, best \$1.30 per pound.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c, 25c, 30c, 35c, best 40c per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in this article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c per pound, and warrant to give perfect satisfaction.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of the

GREAT AMERICAN TEA COMPANY,

Nos. 31 and 33 VESEY STREET.

Post-Office Box, 5643, New York City.

EVIDENCE AFTER A YEAR'S TRIAL.

Treasury Department,
Fourth Auditor's Office, Washington, Dec. 1, 1867.
Inclosed herewith I send you our regular list for December. It is now twelve months since we began the use of your Teas and Coffees, and I am pleased in being able to say that the satisfaction derived from the use of said articles by the members of this Club, instead of being confined to individual instances, is universal and, I think I may safely say, without exception. Thanking you for the many favors received at your hands, I am, sir, very respectfully, your obedient servant,

L. CASS CARPENTER.

Saco, Mass., May 6th, 1867.

To the Great American Tea Company,
31 and 33 Vesey Street, New York.

Gents:—The order I sent you on 23d April for Teas came safe to hand on the 1st May, and the amount, \$915 was forwarded by M. U. Express. Every one seems delighted with the quality of your Teas. The information spread like a prairie on fire, from house to house, that Teas of excellent quality and delicious flavor were to be had for \$1, and \$1.25 per lb., and the enclosed order speaks more in praise of your teas than I am capable of, knowing that only fourteen days have elapsed between the first order and the second.

Many thanks for the complimentary package, and you will please forward this my second order for \$923.50 soon as convenient.

I remain, yours respectfully,

JOHN HEMINGWAY.

CLUB ORDER.

Fond du Lac, Wis., Oct. 28, 1867.

To the Great American Tea Company,
31 and 33 Vesey Street, New York.

Gentlemen—Yours of the 9th came to hand in due time, and likewise the box of Tea and Coffee, I received in good order, and gives good satisfaction. After eleven months trial I have never heard one complaint about your Tea and Coffee. As long as you do as well by us as you have done, we shall never be sorry for finding out the Great American Tea Company. Inclosed please find an order for more Tea and Coffee. Many thanks for your complimentary package.

Yours truly,

ALEXANDER MASON.

N. B.—All villages and towns where a large number reside, by Clubbing together, can reduce the cost of their Teas and Coffees about one-third beside the Express charges, by sending directly to "The Great American Tea Company."

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bagués* or *imitations*. We have no branches, and do not, in any case, authorize the use of our name.

Post-Office orders and Drafts, made payable to the order of "Great American Tea Company." Direct letters and orders to the (as below, no more, no less).

Great American Tea Company,

Nos. 31 and 33 VESEY-ST.,

Post-Office Box, 5643, New York City.

NOTICES OF THE PRESS.

From the *American Agriculturist*.

THE GREAT AMERICAN TEA COMPANY. TO QUERIES.—Before admitting their advertisement, we learned that a large number of our clerks and others had for several months been buying their Tea and Coffee from this Company, without its being known who they were, and that they had been highly pleased with their purchases, both as to quality and price, and were all recommending their friends to the same course. As we have published this advertisement for many months, and received no complaints, we conclude "there is no humbug about the establishment."

Iona, Israella and Delaware Vines.

Of Iona, my stock is large and excellent for all planting, including superlative plants grown especially for gardens and small vineyards for early abundant bearing. I have also a large stock of fine healthy plants of small size for nursery use to make two-year-old transplants, or for very careful vineyardists. My stock of Israella is not large. I have Delaware 2 years old, also single variety.

Iona and Israella holding rank in value far above all others, have received the largest share of my attention in propagation. Israella, my vineyard, for wine or for table use, from lives' seedling cannot stand in comparison, *My estimation*. It has more hardy and enduring roots than any variety that I have introduced, and it bears in every variety of soil, and has more strong points of excellence than any except Iona.

There are a few points in regard to grapes that clearly and palpably demand special consideration at the present time, of all who would choose wisely for planting as to profit and enjoyment for vineyard or garden, for wine or for table use. The point of profit has been reached and passed already by California and vineyardists for the table and for wine, the "uneducated million," are disappointed the expectation of those who planted for them grapes too poor for their own eating, and the rate of interest is almost everywhere low.

With grapes as good as the best of those of Europe, and hardly productive vines, the point at which large profit will fail cannot be reached in many cases (such as Iona). Tons of good grapes like Iona will not satisfy the wants of families that would find a score of pounds of Concord more than enough. One bottle of Concord wine of good quality too much for health and enjoyment where a cask of Iona would be found to suit nearly an allowance.

A SOUTHERN MULE-TEAM. — Drawn and Engraved for the American Agriculturist.

The spirited and faithful engraving of a southern mule team, with its black driver, and the mud-burdened wheels of a winter road, presents a scene familiar to many of our readers. How many hundreds of fine teams were sacrificed to war's necessities during the years 1861 to 1865, not even the records in the quartermasters' offices will correctly show. But the war fairly introduced the mule to northern agriculturists, and now he is more than ever popular with those who have steady hard teaming to do, where four or six mule teams can be conveniently handled. Mules have greater endur-

ance than horses if put to hard labor. They are not so heavy as large horses, and on this account not suitable for heavy city teaming, where two powerful horses must do the work of four lighter ones, principally on account of the necessity of turning in the narrow streets.

The mule is adapted to farm work and to hot weather, though he works well in our coldest winters. He is an easy animal to keep, less liable to disease than a horse, and, though subject to the same maladies, seems to be very much less injured by them for common service.

Mule teams have long been, and probably

ever will be, a prominent feature of the agriculture of the Southern States. The negro driver and the mules seem to get along wonderfully well; they seldom have fallings out, and the brutality common among city teamsters, who have the gentler-tempered horse to manage, is rarely or never exhibited by the mule drivers.

We believe it to be a fact that a mule is but little if any more stubborn or willful than a horse if subject to the same treatment. Certainly the ass is the most long suffering of brutes, and whatever of spunk the mule has, we think comes from the side of his dam.

AMERICAN AGRICULTURIST.

NEW-YORK, FEBRUARY, 1868.

Verdant fields, bright with white clover, or fresh springing grasses, together with the blossoming of shrubs and trees, make many days of the February of the Gulf States and the far South among of the most delightful of the year. Plowing for spring wheat and for other crops gives employment to the laborers and teams, and the season of the work fairly begins with the warm, drying, weather usually occurring at this time of the year.

The Northern Farmer buffers the Winter usually for a good part of this month. He may look for deep snows, powerful rains, ice storms, and hard freezing weather, with the thermometer below zero, and need not be disappointed if before the 20th the frost is all out of the ground south of latitude 41°, and bluebirds are singing. Nevertheless it will probably freeze up again, and the poor little birds will look blue enough.

The days are much longer, and they should show notably more work done than those of December or even January; nevertheless, there is comparative leisure, and season for reviewing the past year's work and laying plans for the coming months, when so much hard labor will be demanded that the mind will not give itself readily to continuous thought. Whatever plans are made, on this very account, if for no other reason, should be put upon paper, so that when the time comes for their prompt execution, they shall not be forgotten. The season of field work, when it does come, will be likely to come all at once, and then you will feel as if every moment were gold, as if the horses and oxen, though doing their utmost, did not walk half fast enough. Therefore use the leisure of this month to get all ready for spring work.

Hints About Work.

The farmers of New England, to say nothing of our readers in New Scotland or even farther north, may smile at the idea of our dropping hints about spring work for February, and congratulate themselves that they have two months of winter yet; as the old salt, in the midst of a roaring north-easter, expressed his supreme pity for "them unhappy folks a-shore now." Nevertheless, we, of a milder climate, can stand it very well not to have the thermometer go below zero more than twice a week, in December and January, and to have a thaw in February that will give us a chance to do a good deal of spring work important to do early.

Field Work.—If the snow is off from the fields, the opportunity is a good one to pick up stones. Cart them off from the mowing and grain fields in the mornings, while the ground is frozen. The grass fields may be gone over with a sharp hoe, and all the tussocks of grass or clods that stand up above the rest of the field cut off smooth.

Winter Grains.—If grain does not look well, and has been thrown by the frost, apply a light even dressing of fine well weathered manure, or soil, and roll, or simply roll without the top-dressing.

Grass and Clover Seeds.—These may be sown toward the end of the month, if the frost is pretty well out of the ground and the surface open and fissured. The sowing is easiest done on a light snow, when the seed may be seen, and an even cast secured. To this end, it is often well to sow in two directions across the field, and sometimes even three, as in sowing grass seed upon a lawn. Suitable weather for this frequently does not come until March. Avoid sowing where melting snows will wash the soil away, or move the seed unevenly.

Buildings.—Timber may be prepared for new buildings, or for alterations and repairs of old ones, and if the weather favors, the frames may be raised, and the building go on. A few handfals of salt, or a little old brine, put about the posts of sheds, corn cribs, gates, etc., which are likely to be heaved out of place by the frost, will prevent it, in most cases, certainly until the salt washes away.

The Wood Lot still furnishes work in cutting firewood and clearing up stuff already down, cutting bean poles, splitting rails and posts, dressing and hauling them. It is a good season to cut pine and hemlock, but hard wood ought to be cut earlier in the season for either firewood or durable timber.

Ice.—The provident have probably taken advantage of the cold weather of December or January, to have their ice all gathered. Still it is not too late, though where ice can be brought to the door, twice a week all summer, at a cost of \$7 or \$10 for all that a family needs, it is hardly worth while to be at the expense of filling an ice-house. When ice is used for a large dairy or other purposes, the case is quite different. Many houses in which it has been found difficult to make the ice keep, will keep it very well if a thick layer of straw or wheat chaff is put at the bottom, and the house filled with powdered ice, thrown in, and beaten to pieces.

Farm Hands.—February is the best month for the employer to engage the best hands, and it is the best time for the hands to make the best engagements. The prices offered to secure a first-rate man are usually larger now than later. At present, January 15th, labor is very abundant in the vicinity of New York City, and it seems likely to remain so.

Seed.—Look out betimes for all the seed you are likely to want, getting samples to test the vitality, and examine the quality before purchasing largely.

Manure.—Composts may be made with two-thirds dry manure, and one-third fermenting stable manure, which will be ready for use in six weeks. Muck composts, or those made with peaty material or soil, may be hauled and spread at any time. It is also an excellent plan to work over all the manure in the yard and barn cellars, laying it up in compact rectangular heaps, well trodden down.

Animals. toward the close of the winter, often begin to show lack of appetite, staring coats, vermin, etc., and, if these are neglected, more serious maladies. This indicates neglect of some kind, and the master must look better to his own.

The Card and Currycomb can hardly be too frequently or too thoroughly used. They will often exterminate lice from colts and calves in a short time, if used two or three times a week upon them. The best article we know of for the removal of vermin is the carbolic acid soap. Cresylic soap is, we believe, simply a trade name for the same thing. This is very efficient as a sheep dip, or wash, at this season, and may be applied without any danger of poisoning or injuring the animals.

Working Stock should not stand idle; find some work for them, and, if possible, gradually increase it, that they shall not feel plowing and other hard work by and by. Both horses and oxen, used on the road, must be kept sharp shod, to prevent slipping and disabling themselves on the ice, and it is an excellent plan to feed roots with the grain given to both horses and cattle, or any other animals.

Colts.—Pet and handle constantly, giving sugar or bits of root. There is often leisure for breaking colts at this season to both saddle and harness. There is seldom need of whipping. Coaxing with carrots or sugar will go twice as far. The results are more lasting and all for good. Whipping may produce a beneficial result for the time being, but the after-effect is only evil, except with hard cases which nothing else will effect.

Steers also may be broken to the yoke and to labor. This is usually an easy matter, and it is an excellent thing to have the sight of the yoke and bow in the hands from the first associated with salt or a turnip. Yoking will be easy ever after.

Bees should be well fed; their gain in flesh is of far less consequence than the gain in the manure pile, but both are equally affected by good food. The great gain in beef cattle ought to be in the autumn. In the winter, if the stables be warm, bees will keep on gaining very well, as a general thing, but in cold stables, the gain will be an expensive kind, food being used as so much fuel only.

Cows.—Most farmers dry their cows early, in order to save the labor of milking. This is poor policy,

unless the cows are valuable chiefly as producers of beef animals. It injures a cow to give milk after she begins to make bag, and as the time of the very beginning of bag making is indefinite, it is well to milk up to within four or five weeks of calving, and then dry off rapidly and stop. The calf is larger at birth for having the nutriment which would otherwise be withdrawn in the milk, but a very large calf often endangers the life of the cow.

Sheep.—The strongest should be by themselves, weak ewes and lambs by themselves, so that the allowance of grain or oil-cake shall be evenly distributed. There is profit in very early lambs, but buildings and everything must be adapted to raising them with their rapid growth unchecked by exposure to the weather, yet encouraged by fresh air and sufficient room for healthy exercise.

Work in the Horticultural Department.

In the recent war in Enrope, the Austrians burned an important bridge; the Prussian commander telegraphed to Berlin, and in a short time a duplicate bridge came with every piece numbered, and ready to put up. There was in store, at Berlin, a duplicate of every important bridge located near the seat of war. What has this to do with horticulture? The principle of being ready for every emergency has much to do with it. Head-work has quite as much to do with a campaign as hard fighting, and effective generalship tells, though perhaps in a less brilliant manner, as well in the kitchen garden as on the battlefield. An extra spade or whiffletree, and a reserve supply of seed to replant in case of failure, are as important to the gardener as an extra bridge or reserve regiment are to an army. Now is the time to anticipate accidents and provide everything that may be needed. Next month, active operations will be crowding, and even now, at the South, out-of-door work is going on. Trees should be ordered at once. We learn from nurserymen that stock of some kinds is very scarce, and it may be necessary to apply to more than one dealer, in order to procure the required varieties. The assortment of seeds is at its best this month, and it is well to secure them now. The same with implements; purchase the best, and have extra ones, or duplicates of parts that are liable to be broken.

Orchard and Nursery.

There is but little of out-of-door work that can be done, except what was given in last month's notes, though at the South planting is in order.

Injured Trees are to be attended to as soon as the trouble is discovered. Limbs that are broken down by ice and snow are to be removed, the wound pruned clean, and, if it be a large one, covered with grafting wax. As the snow disappears, the work of

Rabbies and Mice will show itself. If the bark is only partly removed, put over a thick plaster of cow manure and clay or loam, and bind it on with a piece of matting or cloth. This will keep the parts moist and in good condition to heal when growth begins. Trees that have been completely

Girdled, may be saved by the method of grafting noticed on page 43 of the "Basket."

Washing and Scraping are of great benefit to neglected trees, and washing, at least, may be done with advantage on all fruit trees. It destroys the young and almost invisible growth of mosses and lichens, kills dormant insects that have hidden in crevices, and improves the tree generally. Various tree washes have been recommended, but there is probably nothing better than good home-made soft soap, thinned with water to work conveniently with a brush. It is best to apply it in a damp, but not rainy, time. Remove the loose scales of bark by means of a blunt scraper.

Insects are to be fought at all seasons. We repeat the advice to remove the eggs of the tent caterpillar before they hatch. They are to be found near the ends of the small twigs, glued around in a neat band. The females of the canker worm begin to ascend the trees as soon as the ground thaws. There

are many protectors, all of which agree in principle—that of interposing a barrier over which the insect cannot pass. See "Basket" item, page 49.

Clons may still be cut. Pack them in sawdust; or, if put in a tight tin box, and kept in a cool place, their own moisture will keep them plump and in good condition until it is time to set them.

Planting and Grafting.—The time for doing these operations will depend much upon the locality. We wish to give the caution not to be in a hurry. It is better to delay both until the cold, drying, winds of spring are over. Much of the failure in grafting is due to its being done too early, and many a young tree is dried up before its roots are in a condition to receive any moisture from the soil.

Nursery Trees now being sent out at the South, will be delayed in transportation, and often suffer either from freezing or drying. Thaw frozen trees as gradually as possible, and bury dried and shrivelled ones, tops and roots, until they become plump.

Fruit Garden.

For care of injured trees, treatment of insects, and general matters, see notes under "Orchard."

Pruning of small limbs may be done with the knife wherever necessary, to bring trees into shape.

Grape Vines not attended to last autumn should be pruned in the first mild spell that occurs. Whenever the frost is fairly out of the ground, set

Strawberries as soon as plants can be procured.

Manure may be spread around the trees.

Trellises will be needed for grapes, and posts should be got out. Where durable timber is scarce, set a short locust post in the ground, and spike to it an upright of other wood. Look up the various plans of trellises, and select that which is best.

Kitchen Garden.

Where there is no glass in use there is but little that can be done in most northern gardens, save the accumulation of manure. It is the one thing needful for success in gardening anywhere, North or South. The late Mr. White remarked that he saw more manure ready to put on an already rich market garden of two or three acres, at the North, than a southern planter would think of putting on a farm of five hundred acres, garden included.

Southern cultivators will now sow early crops of bardy vegetables—turnips, carrots, lettuce, cabbages, radishes, onions, leeks, spinach, parsley, etc., and plant potatoes, peas and rhubarb, asparagus and other roots. The time for sowing tender vegetables, such as okra, beans, cucumber, etc., must be governed by that at which it is safe to plant Indian corn. Corn is so generally planted all over the country, and the time at which it is safe to put in the crop is so well established in each locality, that there is always a safe guide for the inexperienced.

Manure, whether to be spread for the crops or to be used for hot-beds, must not be allowed to get overheated. Turn it over, and water it, if too dry.

Cold Frames.—Plants in these will need more care, must have plenty of air, and exposure by removing the sashes whenever the weather will allow.

Hot-beds, unless very early vegetables are wanted, need not be made, at the North, until next month. In southern gardens they may be prepared, and tomatoes, peppers, egg plants, cabbages, etc., sown in them. Shelter from prevailing winds should be looked out for, and if necessary to make the bed in an exposed place, it will pay to put up a temporary fence to shut off prevailing winds.

Straw Mats are almost indispensable where there are hot-beds. See article on page 23, January.

Brush and Poles for peas and beans should be cut while there is leisure, trimmed and sharpened, and stacked near the place where they will be used.

Root Crops that were left in the ground all winter—salsify, parsnips and horseradish—may be dug for sale or use whenever the ground is thawed.

Rhubarb may be forced, by taking up the roots and setting them in boxes of earth in a green-

house, or a few roots in the bed may be forced by covering with boxes or barrels around which is heaped a good supply of fermenting manure.

Potatoes.—Plant some early sort, such as Early Goodrich, as soon as the frost will allow.

Flower Garden and Lawn.

There is plenty of planning, and some work to be done. One of our best writers gives the advice to always have the garden look different each year. The advice is good, and is capable of being followed even in a very small place. Take a single bed in a lawn. One year it may be gay with Colons and other "foliage plants;" in the fall, plant Hyacinths, Tulips, and other bulbs; in early spring, sow *Portulacæ* to make the bed gay when the bulbs have passed out of bloom. In a similar way each bed in a lawn can every year present some new feature. Of course in borders where there are herbaceous perennials, there must be some sameness in their appearance for several years in succession. Yet if these are so planted as to allow room for the introduction of clumps of annuals or bedding plants, a pleasing variety can be made, and be different every year.

Ornamental Trees should have the same care as fruit trees. Most of them will repay manuring, and they need pruning whenever a branch disfigures the proper shape.

Shrubs may be pruned and thinned. Those that bloom on the new wood may be cut back, but those which have their flower buds already formed need only to be thinned when the growth is crowded.

Seeds of Annuals may be sown, where there are facilities for keeping the young plants in good condition until time to set them out, but as a general thing sowing in hot-beds or in window boxes had best be left until next month.

Plants in Pots must have air on warm days, or they will get drawn up by the increasing heat of the sun. Give water only when the soil in the pots is dry.

Roots, such as Dahlias, Cannas, etc., stored in cellars, ought not to be too damp. If there are signs of mould or rot, remove them to a dry room.

Wood Work that is to go out of doors should be repaired. Give rustic work a coat of oil, and paint such trellises and frames as need it.

Lawns may be rolled as soon as the frost is out of the ground, and if they did not have a top-dressing last autumn, give one now of good compost.

At the South.—Make walks, prepare borders, and set edging. On page 63 is given a successful method of raising box-edgings from cuttings. Transplanting of trees, shrubs, and herbaceous perennials, may be done, and the hardier annuals sown.

Green and Hot-Houses.

As the weather gets milder more care will be required with the fires, as sudden changes are apt to occur. Maintain an uniform temperature, which should be 10° to 15° lower at night than during the day.

Camellias that have done flowering are to be pruned, and if the pots are full of roots, re-pot.

Azaleas will now be coming into flower; give more water, and when in bloom, shade from the hot sun in the middle of the day.

Pruning of plants that appear to be sickly may be done, cutting them back at the same time. It is not always necessary to put into a larger pot, but shake out the old earth from the roots and re-pot with fresh soil, in the same pot.

Annuals may now be sown, either to bloom in pots, or for turning out into the borders.

Propagation of bedding plants of all kinds should be going on. Our most successful growers use very short cuttings, of tender and succulent growth.

Forcing Plants.—Hardy shrubs and herbaceous plants that were potted for forcing may be brought into a warm place; give them water as they start.

Bulbs, as they pass out of flower, are to have the flower stalk cut away, but should not be allowed to dry until the leaves show signs of withering.

AMERICAN AGRICULTURIST.

ORANGE JUDG & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.20 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

GREAT SUCCESS

AMONG OUR

Canvassers for Premiums.

Unprecedented Numbers of Subscribers Received—Great Loads of Premiums, large and small, sent out Daily—Our Canvassers unusually successful almost everywhere—The Work still in rapid Progress—Plenty of Room and Time for filling up Premium Lists already begun, and for starting new Lists—Fine Premiums for Everybody, his Wife, "and the Rest of Mankind" (yourself included.)

Though highly successful in past years, yet never before has this Journal received such large daily accessions of subscribers as have poured in since last Christmas. For days together the mails of each 21 hours have brought in above 2000 subscribers, several times running up to over 2600 and 2800, and but once going so low as 1600 per day. Seven days alone added 16,275 names to our subscription books. Our premium clerks have had to work long after midnight to square up their accounts and prepare for dispatching, the next morning, the loads of Sewing Machines, Books, Back Volumes, Scissors, Clothes-Wringers, Silver-ware, Melodeons, Watches, Guns, Tool-chests, etc., etc., including all the articles down through the whole table of Premiums. (See next column). With a few exceptions the universal report is, that people were never more willing and anxious to supply themselves with the *Agriculturist*, and thus the premiums have been secured with unusual ease by the great majority of those who have begun to make up clubs.

It may well be so, for the paper is certainly very cheap and very useful to every family in the land. Why, leaving out all the reading matter, the engravings would alone be worth far more than the subscription price! Every intelligent person will notice that these engravings are, in character and workmanship, superior to those published in any other illustrated journal in the country—superior even to the illustrated journals printed abroad. At least \$10,000 worth of engravings will be published in the *Agriculturist* this year alone. But those constitute only a small part of the value of the *Agriculturist*.

Our friends everywhere may now start new premium clubs, and secure valuable and very desirable articles in return for a few hours' or days' work.—In every town of 500 families, at least 200 to 300 copies of this paper would be taken, if some persons would simply present it, show its advantages, and take the trouble to gather up and forward the subscriptions, in return for which they would secure valuable premiums. The exposures of

Humbags have saved in hundreds of towns far more than the cost of supplying a regular copy to every family.

February and March are first-rate months for canvassing. People are planning ahead for the work of the year, and they will be quite ready to secure the aid, the hints and suggestions afforded by the pages of this journal. In tens of thousands of cases, a single hint received from this paper has in the end proved of far more value than the cost of a dozen or twenty years' subscription. We invite all who have obtained premiums to strike for another one; some have already taken two to five or more; and let those who have not tried it, make the experiment this winter. Our premiums are standard articles, and a supply can be obtained for all who will call for them, during two or three months to come.

Table of Premiums and Terms,
For Volume 27.—(1868).

Open to all—No Competition.

No.	Names of Premium Articles.	Price of Premiums.
1.	Garden Seeds for a Family (40 kinds).....	\$3 00
2.	Flower Seeds for a Family (100 kinds).....	\$3 00
3.	Barney's Stock (Any kind desired).....	\$30 00

Only good articles.—We are careful not to place upon our list anything for a Premium which is not the best, and, in all respects, what is claimed for it. All, therefore, who secure premiums, may be sure that they are not running the risk of getting poor or indifferent goods.

No charge is made for packing or boxing any article in our Premium List. The forty-four Premiums, viz., Nos. 1, 2, 6, and from 36 to 39, and from 50 to 86 inclusive, will each be delivered FREE of all charges,

by mail or express, (at the Post-Office or express office nearest recipient), to any place in the United States or Territories, excepting those reached only by the Overland Mail.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified.

It is Easier than one would suppose, to get up a premium list! Hundreds have written thus, after a little experience. Take a copy of the paper, show what it is, how much it gives in a year for less than half a cent a day, or less than three cents a week, and few will fail to make so good an investment. They will thus be benefited, and you will soon have names enough to secure the premium for your trouble.—TRY IT!....To-day.

If from any cause one fails to get the larger premium desired, the names can be used for a smaller one.

As fast as obtained send us the names, that each subscriber may begin to receive the paper, and when done canvassing, choose the premium, and it will be promptly furnished. Send the exact name with each list, and be sure to mark each list "For Premiums," if it is so designed, that you may be properly credited in our premium record book.

Sundries:—Specimen numbers, Show-bills, etc., furnished free, on application, but sparingly, as they are costly....NOW, in this winter season, is the best canvassing period, but three or four months can be taken to extend clubs begin now....Premium Clubs may contain names from different post-offices, if all are sent by one person....Old and new subscribers are counted, but part should be new subscribers....In the Table the regular cash price of each article is given; and in the next column the number of names required at the lowest club price (of \$1 a year, for twenty or more names)....Any one getting up a club at \$1 or \$1.25 each, can, if preferred, add money enough to bring the names into the \$1.50 column....Remit in drafts or checks on New-York City banks, payable to the order of the Publishers; or in P. O. money orders; or in registered letters, if money must be sent.

Full Descriptions of the Premiums were published in October No., and also on a separate sheet, which will be sent free to any one desiring it. The articles named in the table are all very valuable. We can only spare room here for the few notes following:

Nos. 50 to 60—Volumes of the American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. We have stereotype plates from the Sixteenth to the Twenty-sixth Volume complete, from which we print numbers as needed. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid. They are put up in clean numbers, with the Index to each volume.—They are profusely illustrated, the Engravings used in them having alone cost above Twenty Thousand Dollars! Those obtaining premiums for from one to ten volumes, can select any volumes desired, from XVI to XXVI, inclusive. For ordinary use, the sets of numbers unbound will answer quite well.—Many hundreds of these volumes are taken every year as premiums.

In Nos. 61 to 71 we offer the bound volumes also.

Nos. 74 to 85—GOOD LIBRARIES.

—In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any one of the premiums 74 to 85, may select any books desired from the list below, to the amount of the premiums, and the books will be forwarded, paid through to the nearest Post-Office, or Express office, as we may find it most convenient to send them. We need not enlarge upon these premiums; every one knows the value of good books. Twenty-five or Fifty dollars' worth of books on subjects pertaining to the farm will give the boys new ideas, set them to thinking and observing, and thus enable them to make their heads help their hands. Any good book will, in the end, be of far more value to a youth than to have an extra acre of land, on coming to manhood. The thinking, reasoning,

Containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Mark all subscriptions sent in as New or Old.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; make them payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every money seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the *Registry fee*, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both, for postage and registry, put in the money and take the letter in the presence of the postmaster, and take his receipt for it. Letters sent in this way to us are at our risk.

Postage.—To our published terms for the *American Agriculturist*, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. Everywhere in the United States, three cents, each quarter, or twelve cents, yearly, must be pre-paid at the Post-office where the paper is received.

Three Notes About Advertisements.—1st.—To be sure of insertion, advertisements must reach us by the 15th of the preceding month; it takes the greater part of a month to work off our large edition, especially to print the engravings well. 2nd.—Advertisers should remember that we cannot insert Patent Medicines, or anything deceptive in form or substance, and that advertisers, unknown to the editors personally or of good repute, must furnish good references or other evidence that they have both the ability and intention to do just what they offer to do. Our rule is to admit no advertiser to whom we would not ourselves send an order with the money in advance, if we chanced to want his articles at the price put upon them. 3d.—Our Readers will usually find much valuable information in the advertising pages, by looking them all through, and as we are unusually strict with the advertisers themselves, it is gratifying to them to know that through this journal they come in contact with a large and widely scattered class of intelligent and enterprising persons. We therefore request those ordering of our advertisers, or sending to them for catalogues, circulars, etc., to state where the advertisements were seen.

Grand (Humbug) Prizes!—Clark, Webster & Co., A. A. Kelly, and sundry other parties, are troubling many people by telling them that they (the said people) have drawn prizes of \$200, more or less, which will be forwarded on receipt of the usual cash 5 per cent. assessment. A good many have even sent the money to us, to hand over to them, all of which has been returned to the senders—and pray don't trouble us with any more for this purpose. The "grand prizes" are only certificates for "shares" in a humbug "Petroleum Company." Two Hundred Shares (the \$200 prize drawn) are worth about one-sixteenth of one cent at the present low price of paper. Most of the "prizes" and "gifts" offered by numerous other parties are similar.

Good for Postmaster Kelly.—We really regret just what are the "politics" of the N. Y. City Postmaster—whether he is a Conservative, a Republican, a Democrat, or a "judicious mixture of several," and so we may be permitted to commend his acts as postmaster without treading on anybody's "political toes." The efficiency displayed in all parts of this, the most important Office in the country, the improvements in the city delivery, etc., are patent to all. But we have only room to speak of one thing here, viz. his gratuitous efforts in connection with Mr. Gayler and others, to protect people from the swindling fraternity. Various plans have been tried, involving no little trouble and annoyance to the officials. The latest one is temporarily effective. As we have often announced, many of the swindling schemes are carried on by a few persons who operate under different names. With all our investigations, we can hardly guess how many aliases have been used by Todd and others. Mr.

Kelly hit upon the expedient of refusing to deliver letters addressed to fictitious names, and many thousands of such letters are now held back from the claimants. He has been sued for this, but he shows fight, and we hope he will keep it up vigorously. If defeated in any one case, we hope he will try another, for there are certainly many fictitious firms engaged in watch, jewelry, gift, and other swindling enterprises. If no other good comes of it, it will at least result in compelling the operators to show their hands, or their real names, and when this is done the parties will be more directly accessible to prosecution as swindlers. The U. S. Mail, issued at the N. Y. P. O. at \$1 a year, a desirable periodical for all business men, as well as for all Postmasters, has done good service against the swindlers by mail. It has been the most efficient ally of the *Agriculturist* in this respect.

The American Horticultural Annual for 1868.—This year-book commends itself to all cultivators, whether amateur or professional. Perhaps the best notice we can give of it is to present a résumé of its contents: An Almanac and Calendar of Operations for each month of the year; several useful Tables; an article on Rhododendrons and their Culture, by S. B. Parsons; Propagation of Geraniums and Other Soft-wooded plants, by Peter Henderson; Propagating Evergreens from Cuttings, by Josiah Hoopes; Tropical Gardening, by George Sack; Horticultural Implements and Appliances; Apple Culture with particular reference to Early Varieties, by Wm. S. Carpenter; The New Apples of 1867, by John A. Warder; Pears Tested in 1867, by Hon. Marshall P. Wilder; Peaches, Plums, and Cherries, in 1867; Native Grapes in 1867, condensing reports from all parts of the country; Notes on the Small Fruits in 1867, by Andrew S. Fuller; Notes on the Rarer Evergreens, Deciduous Trees, and Hedge Plants, by Thomas Meehan; New Roses tested in 1867, by John Saul; New and Interesting Bedding and other Plants, tested in 1867, by Peter Henderson; Annuals—New ones tested in 1867—and Selections for Sowing, by James Vick; Notes on New or Noteworthy Vegetables, by Jas. J. H. Gregory; Horticultural Books and Periodicals for the year; List of Nurserymen, Seedmen, and Florists.—Under each head are given references to the new fruits, plants, etc., described, and to all those figured in the horticultural journals during the past year. The volume is abundantly and beautifully illustrated, printed on fine paper, and sent by mail in paper covers for 50 cents, and bound for 75 cents. This is one of the cheapest books ever issued; it contains 161 pages of matter, the excellence of which is attested by the names we have given above. The Annual for 1867 is still in demand, and the plan of the series is such that the volumes will always have a permanent value to all who cultivate plants, whether for pleasure or for profit.

Harris' Insects.—The edition of Harris' Insects Injurious to Vegetation, edited by C. L. Flint, is the most popular work on entomology, and, indeed, almost the only one not intended for the purely scientific student. The familiar descriptions of the insects are much aided by the excellent plain and colored illustrations. Neither this nor any other work contains all the insects one meets with, but as it comprises those which are injurious to cultivated and wild plants, it includes the more common ones, and is sufficiently systematic to give a general idea of the classification of insects. It takes a practical view of the matter as well as a scientific one, and gives the means, as far as known, of combating these enemies of the cultivator. This very beautiful and popular work will hereafter be published by Orange Judd & Co. An edition is now in press and will soon be ready, in a style to keeping with the former issues.

Price, with finely colored plates, \$6.00; plain, \$4.00.

Cannot Tell.—We have several times been asked if a particular person is a subscriber to the *Agriculturist*, and where he lives. In a letter now before us, the writer takes this method of finding the whereabouts of a friend. We cannot easily ascertain if a name is on our books, unless we have the State, County, and Town, and are usually unable to answer such inquiries.

Fruit in Nova Scotia.—C. C. Hamilton, Pres't Nova Scotia Fruit Growers' Association, sent us a half barrel of specimens which were so long on the way that they arrived in bad order. In his letter he says:—"The Valley of Kings and Annapolis Counties, protected on the north by a high mountain, and having the Bay of Fundy to the north of the mountains, seems well adapted to the raising of fruit. Apples are largely cultivated, and within ten years immense numbers of orchards have been planted, a large portion of the trees being imported from the United States, many of which are now bearing. Several nurseries are now in operation which will soon supply us with all the trees we want. Besides apples, we grow pears, peaches, grapes, and quinces, in a limited way, and abundance of plums." Good for Nova Scotia.

Gardening for Profit.—Those who cultivate a large or small garden are reminded of the excellence and practical character of this work. These are attested not only by the general commendation of the press, but by the remarkable demand for it from all parts of the country. Though written by a market gardener, its teachings are none the less adapted to private cultivators. To those with whom land is limited to a small plot, it is especially useful in showing how the most is made of a piece of ground. Every one who cultivates vegetables, whether for sale or for his own use, will find in this work something that will facilitate his operations.—Price, by mail, \$1.50.

Horticultural Societies.—We have several notices of winter meetings of Horticultural and Pomological Societies, which reached us just after the January number had gone to press. Secretaries of these societies are most excellent people, but they are provokingly slow. Of course, we only wish to publish the times of meeting of the State societies, and those whose assemblings are of general interest. If the meeting is to be held in January, give us the notice by the 10th of December.

For Sabbath Schools.—The Question or Lesson Books, entitled, "*Lessons for Every Sunday in the Year*," continue in quite as large demand as ever before, notwithstanding the fact that several other books, modeled essentially after the same plan, have been recently issued. These are designed to secure the learning of portions of the Scriptures; to give a connected view of Sacred History; and especially to aid S. S. Teachers who are not well supplied with commentaries, reference books, and other helps. No. 1 embraces the period from the Birth of Christ to the end of Acts; No. 2, the rest of the New Testament; No. 3, from Adam to Elijah; No. 4, from Elijah to Christ. About half a million copies of No. 1 have been called for, besides large editions of Nos. 2, 3, and 4. They are used by all Denominations. That they are non-sectarian, is well proved by their use in the various churches in nearly equal proportions, and especially by the fact that the author has received letters from members of almost all orthodox churches, each claiming him as one of their own members.—These books are sold at the very low price of 15 cents each; postage to be prepaid when sent by mail, 4 cents each, or 3 cents, when in parcels of 10 or more. We send full sample copies, (Nos. 1, 2, 3, and 4,) post-paid, for 75 cents.

Sundry Humbugs.—During a couple of weeks past we have received a mass of letters containing the schemes of no less than 47 swindling operators—in New York, Philadelphia, Boston, Pittsburgh, Columbus, O., West Hampton, N. Y., Milford, N. H., Providence, R. I., Albany, Troy, Williamsburg, etc., etc. Of these 23 are Gift Enterprises, Lotteries, and pretended Associations, and about a dozen are from bogus Watch and Jewelry dealers. Others are circulars of Mining Companies, Employment Agencies, pretended Cheap Oil Manufacturers, Cheap Ink Powders, vile Publications, Wonderful Medical Discoveries, etc., etc. It would take a volume to describe all these schemes. Here is an extensive Mining Company, claiming the endorsement of U. S. Senators, and other public men, and pretending to be immensely profitable, yet the "President" is sending circulars soliciting subscriptions at \$5 each, from which "agents" are offered \$2, and seven shares free for each 10 shares sold; that is, for \$30 from agents, 17 shares of stock will be given, worth now \$85, and soon to be certainly worth \$255, while "1 per cent in gold is guaranteed on the first of each and every month." This is the gist of the matter, but the offers are so ingeniously stated, and the commissions to "agents" so large, that we hear of numerous persons taking the bait. Why, if even one-quarter of the allegations were true, the Senators and Merchants endorsing the scheme would quickly seize upon all the stock for themselves. We would in one hour get subscriptions for the whole, and save the "President" all the expense of circulars and postage. People should look at these schemes with a little common sense figuring. The truth is, it is all a humbug; the pretended President pockets all he gets; the wonderful Gold Mine is not nearer than the moon. We have dwelt longer on this one swindle, as it is an example of many others much in vogue a few years ago, and now apparently coming to the surface again. The Watch schemes are still numerous, varied in form, but all of a piece. Great promises are made, and cards, tickets, etc., are sent with definite offers of valuable watches for a small sum. We warn the reader that, without exception, every offer of watches and jewelry by circular or ticket is a humbug. In 99 cases out of 100, no return is made for money forwarded, and when anything is sent, it is a poor thing so gilded or silvered by galvanizing as to temporarily cover up the real cheat. Honest dealers who are constantly importing watches and jewelry, would take all the good stock off the hands of these "operators," if they had any, at far higher prices

than they pretend to ask in their circulars. *There is not a watch in this whole city to be bought under its real value,* wholesale or retail, and on standard articles like good watches, there is not a wide difference between the wholesale and retail price—nothing more than a fair business profit. *All of the stories of the "circular" and "ticket" men are the merest falsehoods.*...Take one example of these watch and jewelry swindlers: Geo. Howard & Co., up Broadway, send out an ingenious circular calculated to deceive the unwary. A careful examination of this document shows that they offer tickets at \$1 each, or 26 tickets for \$20. In another place they offer watches valued at \$12 to \$20; and in a third place they say "more than one-half of our tickets draw Gold or Silver Watches." Is anybody so green as to be deceived by this concern? Yet they claim to be selling "6,000 tickets a week" and if they did not find many dupes, they would not continue to send circulars and pay postage. We are trying to enlighten the class among which these and other swindlers find their victims. We hope the circulation of the *Agriculturist*, so rapidly extending, will soon leave no unenlightened families for the humbug fraternity to operate among....Look out for "patent rights" sold for notes "not to be paid until the article proves satisfactory." In such cases, the guarantee is separated and the notes sold in a collectable condition.

...An immense "Lottery" with the sympathy-for-Lincoln dodge attached, is started at Columbus, O.,—with 50 cent tickets, as taking as the "Royal Havana Lottery," with the "wheel" lot and all, only here it is called a "Distribution," and is said to be "managed" by the "Lincoln Bazaar Association." The Managers of the Express Company do not approve of the active efforts in promoting this enterprise, by their Agent, at Columbus, O., and they assure us that it shall be stopped at once....Young men, beware of circulars about sporting and obscene books. Those who send these violate the law once in so doing, and they intend to do it again by *stealing* the money you send them....We are greatly pleased to find other Journals waking up to the importance of giving information about the various swindling schemes that are flooding the country. We have labored hard for this for many years past, at large expense of time, patience, and money, and with the annoyance of lawsuits commenced as a bluff, but as often withdrawn or defeated. We have frequently labored almost alone in this field, as many journals have apparently feared to disturb the profits of their advertising columns. But since General Van Wyck compelled attention to the subject by bringing it forward in Congress, many other papers have taken it up. Even a recent number of the N. Y. Herald slashed away in its editorial columns at the very schemes we have so long been showing up. The Herald would have been consistent for once, if in the same paper there had not appeared a flaming advertisement of the Gettysburg Gift Enterprise. The N. Y. Tribune recently published a long exposure of swindles, going over the same ground we have traveled for many years past. This would have come with more force, if that paper had excluded the advertisement of one of the Gift swindlers that occupied its columns only eight or ten days before. But we hail the appearance of the antidote; and while so very many journals take the ground of "no responsibility for advertisements," the reader must look to the editorial columns for the truth. We can not see how publishers of otherwise respectable newspapers can constantly advertise humbugs, and the disgusting—nay, the crime-producing—medical advertisements that pollute their pages. Take the N. Y. Daily Times as an example. The Herald don't profess to do any better, and any one who places it in his family, knows what to expect.—We have no desire to criticize or find fault with others; but the mixing up of these pernicious advertisements with news and other desirable information is to be greatly deplored; it tends to destroy the morals of the young and the weak-minded, and by so much is a positive injury to society at large.

Cotton Culture.—By Joseph B. Lyman, late of Louisiana; with an additional chapter on Cotton Seed and Its Uses, by J. R. Sypher. New York: Orange Judd & Co.—This work which was announced in December, is now ready. It forms a neat hand-book of 190 pages, and gives all the details of cotton culture, from selecting and stocking the farm, to baling and marketing the crop. Illustrations are given of implements, presses, buildings, and of the insects that are injurious to the cotton plant.—Price, by mail, \$1.50.

A Cover for the Agriculturist.—C. H. Brown, East Bridgewater, Mass., makes a cover for his numbers in the following manner: "Take a thin piece of straw board, double it together, and cut it about one quarter of an inch larger, each way, than the *Agriculturist*, and make a notch at the top and bottom where it is bent. Cover it with some neat paper, and take a common boot lacing, and tie around it from top to bottom, passing it through the notches, and the cover is

ready to receive the *Agriculturist*. A number, (after it is cut), may be slipped under the string, and taken out again when the next one is received. In this way the papers are kept clean, neat, and straight, and are in good condition for binding at the end of the year.

Journalistic Changes.—The Farmer's Advertiser, St. Louis, is now published as a weekly, and has taken the name of Journal of Agriculture; it remains under the excellent editorial supervision of Doctor L. D. Morse. Colman's Rural World is now also a weekly, and Col. Colman has C. W. Martfeldt as joint editor. The Southern Cultivator has changed hands several times since the death of Mr. White, and is now edited and published by Wm. and W. L. Jones. The two Richmond agricultural papers have united, and the resulting Journal, taking the name of both, is the Farmer and Planter.

The Tribune's "Religious Items."

—It is not exactly within our province to reflect upon the religion or politics of any person or paper, but as a neighborhood act we must just hint to the Tribune that the following is just the oddest "religious item" we have met with: "Mr. Beecher's farm, up the river, yielded crops valued at \$3,700 last year."

Tainted Barrels.

—Mrs. A. R. Austen, Ill., says they can be cleaned. "Dissolve a tablespoonful of strong potash in two gallons of rain-water, over the fire. Heat the water to near the boiling point. Rinse around so as to reach every part of the barrel, and stand to cool with the cover on. Then give a good scrubbing and pour out. Rinse with scalding rain-water and stand to cool as before. Raise the cover occasionally to see if the barrel is sweet, which can be told by the smell of the steam. Rinse thoroughly in cold water. If not cleansed by one operation, repeat the process."

An Amateur's Queries.

—(1.) "Do you not think it injurious to use fertilizers that contain potash on tender plants?"—(2.) "Do you approve of whitewashing fruit trees?"—(3.) "Do you approve of plugging trees with sulphur or other ingredients to drive off insects? If so, which is the best article?"

(1.)—The question is too indefinite. All of the common fertilizers contain potash in some form. (2.)—Soft soap will answer all the purposes of whitewash and has none of its disadvantages, among which is its unsightliness. (3.)—We have many times disclaimed any approval of this, but have published one or two reported cases with the object of bringing out facts.

The Farm and Fireside, published in Woonsocket, R. I., and in Philadelphia, has been discontinued at the close of its first year. We are sorry to miss this sprightly young journal from our exchange list.

Barberry for Hedges.—Dr. M. A. C. and others. We never had occasion to grow the barberry but once, and then the seeds were mixed with earth, and frozen and thawed several times before sowing. They came up in the greatest abundance. If the seed be fresh, we believe this preparation unnecessary. Sow as early as possible, in a mellow seed bed; do not cover over half an inch. Plants two years old are best for a hedge.

Birch Bark Pots.—Last spring, Mr. S. F. Alvord, S. Hadley, Mass., sent us samples of birch bark pots, which he finds excellent for starting tomatoes, etc., in the house. They were made of the flexible bark of the Canoe-Birch, (*Betula papyracea*). Where this tree is common, which is only in northern localities, the bark may be used for the above, and other domestic purposes.

The Walter Grape.—In December last we published an account of the Meeting of the Lake Shore Grape Growers' Association, furnished by Mr. Geo. W. Campbell. In this report Mr. C. said: "The Walter was not on exhibition; its originator being perhaps better satisfied with publishing pictures, exaggerating it four times larger than any specimens yet exhibited." Messrs. Ferris & Caywood think that this statement is calculated to do them an injury, and we give place to their reasons for not exhibiting the Walter, and their denial of the charge of exaggeration. They say:

"The Walter, as exhibited at Cleveland a year ago last fall, averaged five-eighths of an inch in diameter as measured. Increase this 'four times,' and it will be two and a half inches. Your readers can now see on which side the exaggeration is by referring to the cut, which was the size of the fruit year before last; and yet Mr. Campbell says we have given to the country 'pictures four times larger than any of the fruit ever exhibited.' He will be as anxious that we shall not exhibit the grape at Lake Shore, hereafter, as he was this fall that we should, as he will be compelled to look these facts in the

face. The Walter has each year, since it first bore, increased in size, and last season averaged eleven-sixteenths of an inch in diameter. These facts are known to the many hundreds who have visited the vine from different sections of the country. We have as yet but one bearing vine which has borne thirty-two clusters each of the past two years, and as our business was of such a nature as to require our personal attention constantly, we concluded to exhibit the small crop but once and telegraphed to the President of the Hammondsport Fair to this effect; but the next day A. J. Caywood, of the firm, was taken ill, and as many were arriving daily from a distance to see the fruit, we concluded not to send it.

"We cannot imagine what consideration caused Mr. C. to endeavor to make your readers believe that we were deceiving the country by exaggerating the size of a new fruit. He was one of the Committee who awarded the first premium to the Walter, at Cleveland, and exhibited as much enthusiasm over it as any one person we saw, and we find on our book his name for twelve vines. We feel constrained to name a few of the many who have visited the vine this last season, and declared in our presence that it was fully as large as Catawba, which averages considerably larger than the berries represented in our cut: J. A. Regan, Esq., Amenia, N. Y., (owner of the Salem); Rev. Asa Bullard, 13 Cornhill, Boston, Mass.; Robert B. Parsons, Esq., Flushing, N. Y.; C. L. Hoag, Esq., Lockport, N. Y.; Rev. B. P. Roe, Highland Falls, N. Y.; and the grape growers in this vicinity.

White Grapes.—"J. D. P." has planted several white varieties, but his fruit all came of another color, and he wishes to know which is the whitest "in this climate." As there is no date to his note, we are puzzled to know where the place is that makes white grapes, "all ways of another color." It may be that careless nursery-men have as much to do with it as the climate. Or it may be that our correspondent is not aware that white, as applied to grapes, includes green, yellowish, pale amber, and anything but white. Probably the hardest and most reliable of the white varieties is the Martha. Very sweet, and in quality much like the Concord. If J. D. P. has a long season, the Maxatavay would suit him; it is an excellent variety under favorable circumstances. The best of white grapes is Allen's Hybrid, but it is too liable to mildew for general cultivation.

Elm Wood, its Uses.—"H. A. M." Harrisburg, Pa. We presume our correspondent inquires for the use of the White Elm, (*Ulmus Americana*), which is by far the most common. The chief objection to it for fuel is its exceeding toughness, but it is used extensively for this purpose upon the farm, though not often carried to market. It will answer for boards, planks and joists, in positions where it will not be exposed to the weather. It is chiefly used for making the hubs of carriage and wagon wheels, and there is generally a market for it at the manufactories of these. The young trees are prized for streets and avenues. The wood of the Winged Elm has a much finer grain and is more valuable.

A String of Queries.

—"J. M. E." Mil. Vernon. 1. The best kind of feed box for horses—is made of iron, and is to be found at the large agricultural and hardware stores in the cities. There are several patterns. 2. Corn Stalks cut and steamed make good feed for horses. If the animals are worked, they should have oats or meal in addition. 3. Bone dust can be procured at the large agricultural stores in our cities at from 40 to 50 dollars per ton. 4. Sorghum will grow on any good corn land. 5. Scrap cake can be procured at the tallow-chandler's.

Verbenas from Seed.—Lizzie Scarborough, Ill., writes that, being unsuccessful in keeping Verbenas over winter, she has tried raising plants from seed. The seeds should be sown as early as possible, and all the better if it could be done under glass, as it is desirable to get the plants in flower early. If seed of a good stock be obtained, most of the flowers will be passable, and there is a chance of getting some very fine ones. There is a great interest attending raising plants that are liable to vary from seed. To be sure, we have to pet a great many that turn out to be worthless, but one success makes us forget many failures.

Patent Office Reports.—J. F. Browne. Write to the Representative in Congress from your district, and he will either supply you or tell you how to obtain one. They are mostly distributed by Congressmen.

A Bit of Potato Experience.

—J. H. Page, Wapella Co., writes: "Seeing your article in last year's *Agriculturist*, in reference to growing potatoes under straw, I concluded to try my luck, which was not so favorable as 'Hoosier's.' I planted three varieties, viz., the Spotted and Blue Neshannocks, and Cuzco, in

precisely the same manner that he did, and along side of them I planted the same kinds, the same distance apart, covered with a plow, and kept them well plowed and hoed. Those covered with earth came up sooner, grew faster, the vines had a much better color, and at digging time produced a third more and better potatoes. Mine under straw, like his, were badly eaten by the moles, etc., and while he covers his this year with straw, I shall cover mine with dirt. In digging, I found it as much trouble to remove the straw as the earth. Seeing it stated that a mixture of coal oil and water sprinkled on potato vines would repel the 10-lined potato beetle, I tried it, making it strong enough to turn the vines black in places; I applied it with a swab, made by tying a rag around the end of a stick. In applying it I knocked off a great many bugs, and by the time I got back on the next row to where I started, the bugs would be up eating away as greedily as ever, and the only plan by which I could get rid of them was to go over the patch once in two or three days, with a tin pan, hold the pan beside the potato hill, and with the hand brush the bugs into the pan, where I had them at my control. The Garnet Chili potato, bragged about so much in the East, has proved the poorest potato I ever raised, as far as eating qualities are concerned. It is often hollow, watery, and hard; it will not cook tender, and has a strong, rank flavor, when cooked." We quite agree with Mr. P. in his estimate of the Garnet Chili.

Whetstone Holder and Guard.—In using a stone for sharpening a scythe, beginners or inexperienced persons often cut their hands against the edge. Then, again, the best stones are usually fragile and likely to be broken into pieces too short to hold in the hand. We bought in London a little instrument useful in both of the above cases. Fig. 2. is a little ring of zinc-coated iron, with four flanges or prongs and a tightening screw on one side. This is slipped over a wooden handle cut out in the centre like a clothes-pin. (fig. 1.) A whole stone, or a broken half of one, is securely fastened by turning the screw, which enables one to use up fragments, or to use very short stones; while the flanges guard the hand from being cut, if a wrong movement happens to be made.

Fig. 2.

The Report of the Department of Agriculture for 1866.—This is a volume of about the size of its predecessors, and in quality of its contents above the average of them. It presents one new feature, in having taken to advertising certain favored agricultural machines. Under the head of "Improved Farm Implements," particular makers get first-rate notices, which, we presume, they paid handsomely for to somebody. With a collection of essays by writers—known, unknown, and those who never ought to be known—should be put together each year, and called a report, we are at loss to understand. Much of the writing is of the magazine style, and of interest to no one but the public printer. All that it is of any importance in the volume could have been better told in one third of the space. With other reforms we look for one in this matter of reports, and it will be well for the new Commissioner to see if book-making in his department does not need to go the way of the seed peddling.

Wooden Cards.—One of the Parisian novelties is visiting cards, cut of the usual thickness (or thinness) from Beech, Sycamore, or other white wood, with the name printed from a copper plate in the usual way. Not likely to become popular.

Death of R. A. Alexander.—The death of an enterprising, judicious, and successful breeder of improved stock is always the occasion of sincere regret among all who regard the prosperity of the country. In the death of Robert Atchison Alexander, we lose from among the prominent breeders of this country not only one of the most distinguished, enthusiastic, and successful, but a gentleman of cultivation, refinement, and high-toned character, of great wealth, which was freely used to pro-

mote the cause of Agriculture, especially in improving the stock of horses, sheep, and cattle. Though possessing some of the most famous blood and trotting horses, it is said he never bet upon a race, and used his influence against degrading wagers and bets both the horse and otherwise useful trials of speed. We regard his loss as a public calamity. His death took place December 1st, at his home in Woodford Co., Ky.

Potatoes on Broadway.—The windows of the office of the *Agriculturist* are at present occupied by a fine display of potatoes, from Reigis & Hexamer, Newcastle, Westchester Co., N. Y. It is curious to observe the crowd they attract. Probably many wonder at the great number of varieties; others stop and think of the time when they used to pick up potatoes on the farm; others, may be, think that when they are able to leave the city and live upon the farm, they will raise just such. Whatever may be their thoughts, there is generally a crowd of interested spectators who inspect 'taters.

The American Agricultural Annual for 1866 is, we think, decidedly in advance of its predecessor, which met with such general acceptance. It presents a great variety of information upon subjects of universal interest to agriculturists; its illustrations, besides, are carefully executed, and numerous. In addition to the Almanac, guide for work for each month, numerous useful tables, and minor items, the especially attractive articles are: *Factory Dairy Practice*, by the Secretary of the Am. Dairymen's Association, fully illustrated by engravings; *Milk and Butter*, by Prof. S. W. Johnson, of Yale College, giving the results of recent scientific investigations; an article on the *Wastes of Sewerage and Projects for their Utilization*, and upon *Earth Closets*, by Col. Waring, author of the article on *Drainage* in the *Annual* for 1867; *Horse Breaking and Biting Colts*, (illustrated) by Col. Heddley, of Morrisstown; on the *Potato Crop of 1867*, by Dr. Hexamer; on the *Culture of Wheat in Western New York*, with description of favorite varieties, by Joseph Harris, accompanied by an interesting letter from John Johnston, of Geneva; on *Scythes, Snaths, and Cradles*, (fully illustrated,) by John W. Douglass. There is an article on *Fish Manure*, of especial interest, one on the *Prices of Fertilizers*, and *How to Judge of Fertilizers and their Analyses*, giving useful information.

The chapter on "Progress of Invention," etc., discusses a number of new or recently introduced implements of sterling value; and the one on "Progress in Agricultural Education" gives a statement, in brief, of the condition of the various State Agricultural Colleges.

The *Annual* closes, after giving lists of Agricultural Books published during the year, and of Agricultural and Kindred Journals, with a *Farmers' Directory*, giving names of Manufacturers and Dealers in Agricultural Implements, Dealers in Seeds and in Fertilizers, and Breeders of Improved Animals of all sorts, Poultry, and Bees.

It is a very valuable companion to the farmer, and interesting and useful for everybody. It is printed very neatly, and the engravings are excellent. 12mo., pp. 152. Orange Judd & Co., New York. Price, in paper covers, 50 cents; bound in cloth, 75 cents.

Seeds, Plants and Implements.—Where to Get Them.—It is not necessary to inform our old subscribers that we do not answer queries as to the best place to get seeds, nursery stock, implements, etc., but the number of letters received of this purport, makes it necessary to state the fact to our new subscribers. These questions answer themselves in our advertising pages, and if we wished to purchase ourselves, it would be quite difficult to decide which advertiser apply to. We believe them all to be fair dealing men. Each dealer has his specialties, which are usually indicated in the advertisement.

Girdled Trees.—"R. V. M." gives the following timely advice. When spring opens in many places, the trees will be found to be girdled by rabbits. The damage should be repaired as R. V. M. directs, before vegetation starts. "With a sharp chisel, about a half or three-fourths of an inch wide, make several incisions around the tree, downward into the bark and wood just below the girdled portions. Then make several similar and corresponding incisions upward into the bark and wood just above the girdled part. Into these it thrust portions of apple limbs, with the bark on, sharpened into a wedge at each end. These form a connection between the upper and lower bark, through which the sap flows upward and the elaborated juice flows downward, and if these portions are placed thickly around the tree, they soon unite together at their sides, and form a complete belt. The places of union must of course be waxed. Connecting the two separated portions of bark in this way has long been practiced, but this particular mode of doing the work by means of a chisel, is little

known and is the only one of any value, as it can be done with great expedition. It scarcely ever fails to secure union, and the wedge at each end fits so securely, as not to be easily displaced."

Feed for Milch Cows in Winter.—E. Naylor, Ohio. The quantity depends upon the size of the cow. She should have as much hay as she will eat up clean, and at least four quarts of Indian meal per day, or its equivalent in other kinds of grain. Roots are exceedingly desirable for milch cows. We err in giving too little oily and succulent or moist food to cows in milk.

The Pashas' Standard.—On page 53 reference is made in connection with a description of the beautiful flowing tail of the Thibetan Yak, to its use by the Pashas as a standard and as a badge of office. The accompanying engraving gives an idea of how they are borne. As our general officers have their rank indicated by wearing one, two, or three stars, so these officers are distinguished as Pashas of one or of two tails. Horses' tails are also used for this purpose, and perhaps more commonly.

Poultry in Winter.—Before the fowls begin to lay generally, make a careful study of them, if breeding for fancy at all, and divide up the flock; put the finest pullets with the best old cock, and the best hens with your choicest cockerels. Give six hens to one cock, and set a few clutches of nine eggs each, this month. A correspondent says the best place he ever had for young turkeys was an empty hay bay. No place could be better for the earliest broods of chickens, if the barn be light enough. Early chickens sell well as broilers, and are generally the prize-takers at the fall shows.

Care of Swine.—Take good care of breeding sows; give them warm nesting places, and plenty of straw, a few cabbages or roots occasionally, and twice a week or oftener a pint of freshly burned charcoal, pounded very fine, and mixed with meal; a handful of ashes is good now and then.

Hop-Sets.—W. Farmer, Daotah Co., Minn.—These can be safely sent a long distance by rail. The dealers usually advertise them at the proper season.

Triplets—Calves.—John P. Dodge, of Macomb's Farm, had an Ayrshire cow, which dropped three bull calves, Dec. 28th. They are half Alderney.

The Rinderpest in Belgium.—An alarming eruption of this disease, it is announced, has occurred simultaneously at two points below Antwerp. The infected localities were at once put under the charge of Government officials, sanitary cordons established, several animals slaughtered, and it was hoped the disease was under control.

The American Naturalist.—This popular journal of Natural History gains in value as it gets older and more firmly established. The January number, now before us, has an especially interesting article by the eminent comparative anatomist, Dr. Jeffries Wyman, on the Shell Heaps of New England. These shell heaps, often an acre in extent, and several feet in thickness, occur at various points along the coast from Florida to Maine, and indicate the favorite places of resort of the Indians. A careful examination of them shows, not only the kinds of "shell fish," which served the aborigines as food, but the bones of several birds and quadrupeds indicate the variety of their fare, while fragments of pottery, implements of bone, etc., give us glimpses of their domestic life. Besides the article of Dr. Wyman, there are others upon different branches of natural history, in which the subjects are treated in a manner sufficiently popular to be acceptable to the general reader, and well illustrated. Those who have been wishing for a magazine of popular science, should see to it that this one is supported not only by their subscriptions, but by their contributions. The magazine is published by the Essex Institute, Salem, Mass., monthly, at \$3.00 a year.

Canada Thistle.—C. W. Jones writes: "I have several patches of Canada Thistles on my farm, and have been at work on them for several years with the dock spade and salt, and found that I can keep them under, but cannot eradicate them, by this process. It has occurred to me whether you could not point out a less ex-

pensive and more effectual way of getting rid of them, and if so, you will very much oblige me, as well as a number of my neighbors." Smothering with a heavy coating of straw has been sometimes successful. If the patches are not too large it would be worth while to try the effect of a heavy mulch of straw, tan bark, or something of the kind.

The Arch Sleigh-Bench.—Henry H. Zabriske, of Paterson, N. J., sends us a sketch of a style of sleigh-bench, which strikes us as both new and valuable. He writes: "I work at wheelwrighting, and make what I call the arch-bench sled, which is cheaper and stronger than the old style. I made one for myself

of 1½ inch stuff, that will carry a ton weight with ease; everyone that sees it likes it, and I have more orders for making them than I can fill in a long time. If it is new to your readers, give it to them. I have eight acres of land which I never knew the good of until my neighbor got me to subscribe for the *American Agriculturist*." The size and strength of the pieces must be adapted to the use to which the sleigh is to be put. The bench consists of a rim, bent like a wagon-wheel felloe, attached to the cross-bar or beam by bolts, and substantially braced by iron braces at the sides, as shown in the engraving.

Moving Trees.—Harry Baker, Washington Co., Wis., gives his method of moving trees from the forest, as follows: "Before the ground freezes, cover the roots of the tree selected for removal with coarse manure sufficient to keep the frost out, and do the same to the place the tree is to occupy. When it freezes hard, take away the covering and mark a circle around the tree, leaving a good ball of earth; outside of the circle dig a trench, sufficiently wide to work in, and shape the ball of earth like an half orange till it rests on a pivot. Then dig the bank away for a gangway large enough to let the ball of earth through, leave it till morning, when it will be as hard as a stone; then take the team and stone boat, slip the stone boat down the gangway, use the tree as a lever, and pull the top directly from the stone boat; then slip the boat underneath the tree, and draw it up to the place where you want it, dig your hole, set the tree upright, drive three stakes around, and fasten with hay bands. The advantage of moving trees in this way is, you do not injure the limbs or the small fibrous roots, and it is surprising how easily one can move a large ball of earth with a tree stuck in it for a handle. If there is snow upon the ground, the operation will be so much the easier."

Root Grafted Trees.—There is a growing feeling that much of the trouble with young orchards in the West is due to the manner of propagation, and one of the Western Horticultural Societies has published a warning against root-grafted trees. The wisdom of this depends entirely upon what is meant by root-grafted trees. If it is intended as a protest against the practice of attaching a fragment of a root to a cion, and trying to make a tree of it, we in the main agree with it. If, on the other hand, it is intended to include those trees formed by grafting upon the collar of a seedling stock, we must dissent. Both reason and practice teach that trees grown in this way are as good as those produced in any other manner.

"Rotten Root."—Among the causes that produce death in young trees is the disease known as "rotten root." The matter was discussed at the recent meeting of the Northern Illinois Horticultural Society. Mr. Walsh ascribes this to the "woolly aphid," which attacks the roots and causes large excrescences, followed by decay and the death of the trees. The remedy proposed is to examine the trees in the spring, and if any insects are found, which may be recognized by the cottony substance which envelops them, to apply hot water.

Forcing Vegetables.—"*J. H. S.*," Montreal, Canada. This is done only in a small way in this country, and in hot-beds. It would doubtless pay well were all our large cities to have regular forcing houses. The first outlay is of course considerable, but a properly managed house will give several crops in a season, and the products will meet with a ready sale. The best house

is doubtless that described by Mr. Henderson in his *Gardening for Profit*, where drawings and measurements are given as well as directions for its management.

Macaroni.—*R. G. Honeybrook, Pa.* Your trouble, which resulted in making a "mush" of your macaroni, was probably due to your getting the American article and not the Italian. The imported is made from a wheat containing a great deal of gluten, and cannot be successfully imitated with common wheats. Get Italian macaroni, break it to a convenient size, and put it in boiling water to which a little salt has been added, and boil gently until done. It can then be dressed in various ways. If you wish it *a la Milanese* put it in a tin pan or pudding dish, grate cheese over the surface, and brown in a quick oven. Dressed with butter and a little milk it is very nice, as it is when served with any good gravy. Macaroni is not very expensive and to our notion is a most welcome article on the dinner table.

Tea Pottery.—"Subscriber," in New-London, Ct., says: "My good wife is one of those who believe that nothing equals the black earthen pot to infuse or draw tea in; and these being perishable, because unfitted to stand sudden heat, she has generally found it for her advantage to purchase them by the dozen. She has a way to prevent breaking that may be useful in other families, viz., always keep somewhere on the top of the range, or stove, the sancer of an earthen flower-pot, which costs little or nothing. When needed, she draws it over a hotter portion, and sets the tea-pot in it. If by chance the sancer is broken, little harm is done. As the result of this course for six months, she reports only two saucers broken, and the pot remaining whole."

Meerschamm.—*J. S. Witner.* The material of which the true Meerschamm pipes are made is a mineral found in some parts of Turkey and Greece. Chemically it is a silicate of magnesia and in composition allied to soap stone. It being very light, the fanciful name Meerschamm, foam of the sea, was given to it, which has led to the not uncommon idea that it is in some way prepared from sea froth. In its rough state it looks like a lump of very white clay. It is easily carved and worked into shape, after which it is put into boiling water, and then polished. Imitations are made so like the true article that only an experienced eye can tell the difference.

Good for Maine.—A daily paper says that the Maine ladies trim a large pumpkin seed with fur, and wear it for a bonnet, the large end being worn in front, to protect the forehead. We shall welcome any style of ladies' head-dress that is worn with a view to protect any part of the head. Any change must be for the better.

Dickens' Works.—The advent of this the most popular of living authors, and his public readings, have given new life to the old editions of his works, and have called out several new ones, varying in style and in price. Some of the very cheap editions are in such small type that they are not to be commended to those who have any regard for their eyes. T. B. Peterson & Brothers, Philadelphia, publish several editions, ranging in price from 75 cents, in paper, to \$3 a volume. That called the "People's Edition," with each work in a large duodecimo volume, is on good paper, in clear type, and strikes us as being, at \$1.75 a volume, the best of the moderate priced editions, and cheap for the quality.

Erratum.—In the January number, page 21, in speaking of the European Mistletoe we by a slip of the pen called it *Viscum flavescens*. It should of course have been *V. album*.

Canker Worms.—In some places the tent-canker is mistaken for the canker-worm, but the two are quite different in their habits, and the span worm, also called canker-worm, is different from either. The females of the true canker-worm are wingless; they form their chrysalids in the ground and come out of these in early spring (sometimes in autumn), crawl up the trunks of the trees, and there lay their eggs, from which are hatched the destructive worms. All the methods of combating this insect have for their object the preventing of the female from ascending the tree. Numerous things have been proposed in the way of obstructions, from tarred paper to very ingenious troughs to be kept filled with liquid. There are many of these that will answer, if properly attended to, and all are perfectly useless, if the barrier, whatever it may be, becomes passable by drying, or becomes bridged over by dust, leaves, or even dead insects. In 1865 we published an illustration of an easily made protector, which, as it has been inquired for several times, we reproduce. Pro-

Fig. 1.

cure a strip of tin 3 inches wide and long enough to make a ring to encircle the tree, and leave 2 inches space all around between it and the trunk. Turn over one edge of this tin as shown in figure 1. A piece of cotton cloth, as long as the tin and rather wider, has a hem upon one edge to receive a cord, and the other edge is fastened to the tin by placing it in the fold and hammering close. The manner of application is seen in fig. 2: The cloth is bound tightly to the tree by means of the drawing string and the ends of the tin joined by means of one or two rivets. The edges of the cloth are to be fastened where they lap, by a few stitches. All should be so arranged that no insect can pass up the trunk without first going over the tin, which of itself forms quite an obstacle to the insect, though not a complete one. The surface should be smeared with Mr. David

Fig. 2.

Lyman's prescription, of equal parts of kerosene and castor oil; this is fatal to insects and keeps in good condition for a number of days, but should be renewed once a week. Any one who is really in earnest in protecting his trees, will visit them every day or two to see that the protectors, no matter what kind is used, are properly adjusted and in good working condition.

Spring Budding the Peach.—*F. H. Colton.* The earliest time at which this can be done is when the stocks are in full leaf and the bark will separate from the wood, or "run," as nurserymen say. The cions to furnish the buds must be cut while still dormant, and kept so by placing them in an ice-house.

The Westchester Co., N. Y., Agricultural Society. At a recent meeting for election of officers for the present year, made choice of Mr. Warren Leland, as President. Mr. L. resides in the town of Harrison, where he has a fine farm of 500 acres, 450 of which are under cultivation. This is said to be one of the best cultivated farms in the country, and we have no doubt it is cultivated with profit, there being in this case no middle men between the producer and consumer. Mr. Leland's fondness for agricultural and horticultural subjects is well known, and the society certainly has secured the services of a very efficient officer.

The New York Fertilizer Market.

—The price of fertilizers along our seaboard is regulated a good deal by the price which they bear in New York. This is especially true of bone-dust and the superphosphates. The changes which take place in the prices, are usually gradual, and commonly upwards. There are a number of kinds of "superphosphates" in market, passing under a variety of names, animalized, ammoniated, etc. It would be an exceedingly useful thing if all the prominent fertilizers, especially superphosphates, could be subjected to examination by competent chemists, and their results published. The manufacture of superphosphates presents an unusually attractive opportunity for rascals to defraud the unsuspicious. The prices of some of the most reliable fertilizers are as follows:

No. 1 Peruvian Guano.—The price for this article varies with the premium on gold. At present, with gold at 35 per cent premium, it is selling at \$85 per ton of 2000 lbs.; with gold at 40 per cent, it would be worth \$90.

Baker and Jarvis Island, (South Pacific Phosphate.) Guano.—\$45 per ton. These can be treated with sulphuric acid, the same as bones, thereby making a good superphosphate; they should contain an equivalent to 60 to 70 per cent of bone phosphate of lime.

Superphosphates of lime.—\$35 per ton, in bags of 160 lbs. and barrels of 250 lbs. Raw bone superphosphate, \$35 to \$56 per ton in barrels of about 250 lbs.

Fine Ground Bone Dust.—In barrels of 250 lbs., the barrels tarred, \$45 per ton; floor of bone, \$60 per ton; fine floated bone, \$65 per ton.

Fish Manure.—Finely ground, \$45 per ton; not ground, \$30 per ton.

Gypsum or Land Plaster.—Ground, \$1.75 per barrel, by seven barrels or more; a barrel will weigh about 250 lbs. Shell Lime.—10 cents per bushel, or \$1.50 per barrel.

Sulphuric Acid, 66° (Oil of Vitriol), 2½ cents per lb.; Sulphuric Acid, 60° (Pum Acid), 2½ cents per lb. Carbonyls, \$3 each, (returnable); they contain about 150 lbs.

Lead Pipe—Lead in Water.—"*E. C. S.*" asks if the illness of his horse is due to his drinking water which came through a lead pipe. It is not easy to

tell without knowing more about the case. As a general thing, spring water is not apt to be contaminated by lead; at all events, the risk is removed by using the tin-lined pipe, which is just as cheap and perfectly safe. . . . A. B. Razz. The quantity of lead in water that has passed through lead pipes is so small that while its detection is easy to the chemist, it cannot be made with any certainty by those not familiar with chemical operations. If you wish to make the experiment, add a few drops of vinegar to the water, and gently evaporate a quart or so in a china bowl or plate to a wineglass-full. Dissolve a bit of Iodide of Potassium, (to be had of the druggists), the size of a pea, in half a wineglass of water, and add it, a drop at a time, to the concentrated water in another wineglass. If lead be present a yellow cloud will appear in the water, and upon allowing it to stand, a yellow powder (Iodide of Lead) will settle to the bottom of the glass. Great caution should be used in adding the solution of Iodide, as an excess dissolves the yellow powder.

Grasshoppers.—Atchison County, Mo., was plagued with grasshoppers last year. G. Steiner writes: "They have eaten up all the winter grain, and have done the cabbages and other late crops great damage. In May last, the eggs hid late fall hatched by myriads, and the insects remained with us until the middle of July, when full grown. Then they rose up of one accord, and all left at once. On the 20th of September, they returned in clouds that darkened the sun, and at the time I write, they have laid their eggs in the ground. Last spring they destroyed all the spring wheat and oats, and did rye and other crops much damage."

Plaster vs. Stable Manure.—T. Lee, Mich. On many soils remote from the shore the effect of plaster is magical, bringing in white clover and securing a strong growth of grass. If this is fed off by cattle remaining upon the pastures, the land increases steadily in fertility. Plaster is not, however, a substitute for manure. Four and a half miles is a long way to cart stable manure. We should prefer to cart night soil, if it can be obtained for the carting, as it can in most towns and villages, where they are anxious to get rid of it. This is generally the cheapest source of fertilizers to suburban farmers. Dead animals from the city streets are also used to great advantage. Wood ashes, and the wastes of woolen factories, and of tanneries, are generally worth much more than they cost. Spread plaster on pastures, one or two bushels to the acre, and sprinkle it about the stables. It also may be used in the hill, with corn and potatoes, with good effects.

Hedge in Maryland.—"Hedge," Kent Co., Md., wishes an evergreen hedge, and we give his letter for the most part entire, as it and the answers will interest others, and it also shows how questions crowd upon us. This letter has been on hand for a long time, for the reason that there were so many queries that we saved it to make it the text of a longer article than we usually put into the "Basket," but finding no space elsewhere, we reply here. (1) "I wish to plant a fancy or ornamental hedge, that will turn stock, on each side of my lawn or front yard. I prefer an evergreen. (2) Holly is very slow; how would it do to set out a row thickly with young Holly trees, say as large as your wrist, cut off the tops to four, five, or six feet, and then, in a year or so, when the plants were started vigorously again to growing, to lay or slash them as the Orange Orange and Buckthorn is sometimes treated? Or cut the plant down to the ground when first set out? (3) How are Holly hedges usually made? (4) What would you say of the *Mahonia Aquifolium*, (Holly-leaved Barberry or Mahonia Barberry.) and how best propagated? (5) Your opinion of the common Barberry, (*Berberis vulgaris*)? (6) How would the *Taxus bacata*, (European Yew) answer the purpose? How best managed, etc.? Is it an expensive plant, and do the nurseries usually furnish it? (7) Have a small farm, nicely and publicly situated. In putting an Orange Orange hedge around the whole place, can bound all around by road, and wish to divide the lawn and front yard by this fancy hedge. (8) At Wilmington, Del., we have *Willows* of which *poet* and *baskets* are made; we call it the *Powder Willow*. Is that the *White Willow* for live fence?"—1. None of the Pine family will make a hedge that will turn stock. 2. The only way to get a proper hedge is to start with young plants, and make a good growth from the base. It would take much longer to get plants of this size established, and in shape,—if it could be done at all. The treatment for the Orange Orange would not do for the Holly, as one is a rapid grower, and the other a very slow one. 3. Holly hedges are but little known in this country. In England, great stress is laid upon a well and deeply worked soil, in order to get as rapid a growth as possible. Young plants are set at a foot or eighteen inches apart, and treated as other hedges. 4. This will not make a hedge that will turn stock, but very handsome as a division hedge, with the fault, at the

North, that the leaves turn black in winter. Readily raised from seed. 5. We think highly of it, but it is not an evergreen. 6. Will not turn stock, and too uncertain unless you wish to experiment. May be had at the nurseries at a not very high price. 7. If you wish a "fancy hedge," and one that will turn stock, we do not know of anything better than the Holly, if you can wait for it. Why not keep the stock away, and then Hemlock, the most beautiful of evergreen hedges, can be used. 8. The White Willow and the "Powder Willow" are the same, and the one used at the West for fences. It would not answer your purpose as an ornamental hedge.

Pine Leaves as a Mulch.—"W. H. L." writes: "In the Dec. No. you recommend covering strawberries with Pine straw, or rather the foliage from the Pine tree, which I carefully rake off the grass, as it falls, as it appeared to me to kill the grass on the lawn where it laid. Will not the use of it on the strawberry sour and injure the soil so as to interfere greatly with the sweetness or quantity of the crop?"—The effect on the grass is merely mechanical and not due to any injurious quality in the Pine leaves. A covering of any kind is injurious to grass when it is growing. With strawberries the case is different. We wish to cover the soil to prevent alternate freezing and thawing, and if the mulch is allowed to remain, to keep down the weeds. Pine straw has been used largely at the South for such purposes, and we never heard of its producing any untoward effects.

Weeds.—"J. W. K." Quincy, Ill., asks "Is there any way to exterminate what we call here wild sweet potato vines, or wild morning glory vines?" We have frequently stated that there is no specific to kill weeds. There are but two ways of getting rid of them: Put the hand in some crop that requires constant working, and cultivate it diligently, or use a crop that will grow so luxuriantly as to crowd out the weeds.

Poppy Culture.—"J. C. L." Montgomery, N. Y. An attempt was made early in the present century to cultivate the Poppy for opium. We have forgotten why it failed, but as the production of opium is much dependent upon a suitable climate and very cheap labor, we do not think that this and similar cultures can be undertaken in this country with a prospect of success.

Buckthorn Hedge.—"J. S. E." Afton, Iowa, says: "Please give us some information through your columns or by letter, with reference to the Buckthorn or English Hedge, of its adaptation to our climate, and durability as hedge." The "English Hedge" is the Hawthorn, and the Buckthorn is comparatively little used in England. Some of the best hedges we have seen have been of Buckthorn, and we are at loss to know why it is not more used. Its hardiness adapts it to northern climates, it grows well, is not liable to be attacked by insects, and holds its leaves well into autumn.

Beans for a Fence.—Thos. Bragg, Raleigh, N. C. Apparently the White Runner, this is a white variety of the Scarlet Runner, so much used as an ornamental climber. The beans are often sold for the Lima, to which they are much inferior, though of fair quality. The plants are decidedly different in appearance, and the ripe beans are thicker and much whiter. It has quite a number of local names, and is, we think, advertised by some dealers as new, under one or more names.

Bees in February—Advice to Beginners. by Wm. W. Carr.—"The directions in the Apilary for last month are still in force. It is customary at this season to purchase bees. Being comparatively light in stores and in numbers, they can be moved with less risk of combs breaking down, or of smothering, than after May. As there is but little to do in the apilary this month, beyond seeing that the hives are properly ventilated, and the entrance so contracted as to prevent a strong current of cold air blowing on the bees, and to exclude mice, I will give a few hints to beginners in bee culture. In the first place, buy none but strong, healthy stocks; it is better to pay twenty dollars for such a colony, than to pay five for a diminutive starveling, which will neither produce surplus honey nor give an increase of swarms. To build up a weak colony and make it prosper requires experience for success; beginners should let it alone, and neither be anxious for a rapid increase, nor dwell on the deceptive beauties of geometrical progression in counting upon the number of stocks one may be the owner of in a few years. Many persons engage in bee culture, expecting to amass a fortune in a short time, and by a little mismanagement sustain a heavy loss instead of realizing a handsome profit on the money invested. Improve the long winter evenings by consulting the best authors, Langstroth and Quinby, and question persons in your neighborhood who have met with the greatest success. Procure the best hive; in this, no

your judgment. I prefer the Langstroth. Keep none but strong colonies. If the beginner will exercise a good share of common sense, experiment cautiously, he will thus avoid involving the welfare of his apilary in the success or failure of a single venture, and will be pretty sure to meet with encouraging success in bee culture.

Hotels in Europe.—We so often met subscribers, who recognized us from the register of names at the hotels in Europe, that we conclude very many of our readers travel abroad. And why should not this be the case? The enterprising people who accumulate money for traveling, are quite likely to avail themselves of the advantage which such a journal as this affords. As many others of our hundreds of thousands of readers are likely to visit foreign lands, we may well give from time to time any useful hints drawn from experience or observation.—Every American traveler knows the difficulty of choosing a good hotel in the different cities in Europe. The guide books, especially the one most carried by Americans, often commend only those houses which pay the highest bounties. (Thus, for example, at Interlaken, Switzerland, there are many good hotels, but as we incidentally learned, the author of the guide book received 500 francs to name but one. Of course, we found a portion of the 500 francs in our bill, at that hotel.) As the European hotels charge by the items, there is good opportunity to reckon these up to any desired sum—all the traveler will stand, usually. Candles, or "tallow droppers," are almost always charged for, at three to six times their cost. Most of the hotels are neat and well kept; some of loud pretensions are far from neatness and comfort. We name here some which we found all right as respects comfort and reasonable charges, starting some where we found extra comfort. Cork, *Royal Victoria*; Dublin, *Grechian*; Belfast, *Imperial*; Portrush, *Antrim Arms*; Edinburgh, *Waverloo*; Brussels, *Bellevue*; Amsterdam, *Amstel*; Cologne, *Bellevue*; Frankfurt, *Union*; Dresden, *Bellevue*, also *Victoria*; Berlin, *Hotel de Rome*; Stockholm, *Lyngby*; St. Petersburg, *Hotel de Grand*; Moscow, *Ducasse*; Warsaw, *L'Europe*; Cracow, *Szare*; Munich, *Four Seasons*; Mt. Ricci, *Rigi Staff*; Andermatt, *St. Gotthard*; Faido, *Angelo*; Magadino, *Bellevue*; Stresa, *Barracane Isles*; Domo d'Ossola, *Grand de la Ville*; Brivez, *Angleterre*; Martigny, *de la Tour*; Geneva, *de la Paix*; Verone, *Schweizerhof*; Turin, *L'Europe*; Milan, *Carroz*; Berna, *Londres*; Venice, *Bauer's Grand Hotel de la Ville*; Bologna, *Bron*; Florence, *New York*; Leghorn, *Washington & Victoria*; Rome, *Angleterre*; Naples, *Hotel de Russie*. We omit cities where the hotel selected was more or less unsatisfactory. At London, the *Langham* is a really grand hotel, much frequented by Americans. Those who wish less display of fashion and dress, and lower prices, will find very comfortable quarters at the *Queen's Hotel*. We have tried both. As most persons remain there two weeks or more, the preferable way is to seek what are termed "lodgings" or "apartments." One can get good well furnished rooms, with service, cooking, etc., at moderate stipulated rates, and order whatever he likes for each meal, paying only its cost. In this way he has all of the comforts of a home, just such food as he desires, or the market affords, and as cheaply as he could live at home. We found a good home at Mrs. Clive's, No. 6 Upper Woburn Place, adjoining Tavistock Square and Dickens' city residence. (The streets in this quarter are barred against carriages from sundown to 8 A. M., which renders them very quiet.) In Paris, in 1892, we found the *Grand Hotel de Louvre* an excellent residence, at reasonable rates; in 1897 it was exorbitant in its charges and pretensions, as were most Paris hotels. One will enjoy more quiet and comfort at less pretensions but good homes, like the *Hotel de Londres*, on Rue Castiglione, and others of its class. In Vicenza, all the hotels are said to be pretentious, and rather proud of their reputation for high charges; we found the *Archduke Charles* of this class, and would try another if going there again. At Luzerne, there are several good hotels, full and expensive in the "season." The *Hotel Balances* is reasonable, quiet, and has some very good rooms, with balconies over the water; table, good. The worst of all the hotels we were forced into, was the *Hotel de Londres et Post*, at St. Michael, before crossing Mt. Cenia. The other hotel there cannot be worse, and may be better.

Milking—How Often Should it be Done?

An experienced dairyman discusses at some length, in the *Agricultural Gazette*, (Eng.), the number of times a cow should be milked daily. We need not give his views in full, but they are decidedly in favor of milking three times a day instead of twice. His argument for a more frequent milking is founded upon the fact that a cow with the calf by her side, in an

abundant pasture, where she can soon get her fill, will feed four times in the twenty-four hours, and have an equal number of times for ruminating, and that the calf will suckle regularly at times corresponding with these. While he does not think that milking four times a day is advisable, as we are able to depart from the natural course of things within certain limits, yet he holds that thrice is nearer to the manner in which the cow is milked by the calf than is twice, and that cows, milked three times a day, have a tendency to convert their food into milk, rather than into fat, while with a less frequent milking, the secretion of fat is more active. He says:

"The reader will bear in mind that we are confining our observations to cows fed on highly nourishing food—the starving system of the olden time having been thrown overboard; and the question now under notice, of cows being more liable to go dry and run to fat when only milked twice a day than when milked thrice, must appear so plain to those who have any lengthened experience in the matter, as hardly to require a word of detailed argument to fortify the conclusion. Thus, according to our own experience, there were about 14 hours between the evening and morning milkings, on the bi-meal plan, and 10 hours between the morning and evening. In some town dairies, the length of time between the evening and morning meals is greater, and that between the morning and evening, less. During the summer months, we have had only 13 hours between the evening and morning, and 11 between the morning and evening, the times being thus more equally divided. Under the three-meal system there were ten hours between the evening and morning, and seven hours between each of the other two meals; the night interval in the summer time being shorter, and the day interval longer. Such being the facts of the case as to the length of time, upon which the argument hinges, the reader will perceive that, assuming the ruminating, digestive, and secretory functions equally healthy and active in both cases, the milk remains four hours longer in the udder of the cow under the two-meal system than under the three-meal system over night, and twice these hours during the day. The effects of this difference upon the functional economy of the cow generally is obviously to increase her carcass weight, and reduce the quantity of milk secreted between meals. In discussing this question, it must further be borne in mind that both these processes—the manufacture of meat, if we may so call it, and the manufacture of milk—are continuously going on in a healthy cow; so that it does not require much force to turn the balance either way, more especially when there is a natural tendency to the secretion of fat, especially over night, and the adverse to the secretion of milk. In principle, the argument of milk remaining in the udder for a length of time after it has been secreted, is identical with that of leaving a portion in the udder after milking. No doubt sour brewer's grains and distiller's wash may be given to cows in quantity sufficient to stimulate the secretion of milk, and counteract the tendency to run to fat, but the practice is out of date, and the argument which it involves unworthy of the present enlightened age.

"In those localities where cows are only milked twice a day, there would doubtless be many objections raised in the adoption of milking three times, even in examples where all the milk is consumed upon the farm. But those who raise this objection should first bear in mind that their present practice took its rise in

times when cows and calves were half starved, conditions which do not apply in the present age; second, in those districts where three times milking is the common rule, no difficulty is experienced in getting servants to attend regularly to the hours of feeding and milking.

"As to commercial dairies, where the whole of the milk is either sold wholesale or in retail, the third meal may be used for raising cream, or a portion of it, the remainder being warmed and mixed with the morning milk, which would rather improve the latter than otherwise, the evening milk being richer than the morning milk. This, we may observe, is no hypothetical proposition, but the actual practice successfully followed in those districts where cows are milked three times a day—large towns in them being better supplied with new milk, butter, and cream, than towns situated in districts where the two-meal system is exclusively practiced. In short, no valid objection can be raised to the three-meal system, if dairymen would consult their own interests, and the welfare of their cows, free from craft prejudices."

Farm Laborers—Prospects.

The time is at hand in the North, for securing labor for the approaching season. The hired man, in the good old times, began his work on the 1st of April, and the term of service was for 6 or 8 months. A longer term did not suit his convenience, or that of his employer. He could teach school in the winter, or strap on his trunks and peddle, tend saw-mill, or butcher pigs, and make more money than he could on the farm. And, then, in the days of homespun, with all due allowance for the many virtues of our fathers, there was not quite so much enterprise in winter as now, and comparatively little was done upon the farm. The hired man got 9 or 10 dollars a month for his summer labor, and thought he did pretty well. Now the average price of labor in the Eastern States is 33 dollars a month, and for the whole country, 28, as last reported by the Commissioner of Agriculture. We think there must be a little reduction from these prices the present year. There has been a large accession to our population from Europe, the most of them males, in the prime of life, who have come to this country seeking labor. They have strong hands and willing hearts, intent upon improving their fortunes and in due time getting homes of their own. Many of these go West, but multitudes linger at the East, and can be employed at reasonable prices upon the farm. Then it is to be considered that our manufacturing interests are somewhat depressed, and wages are reduced from ten to twenty per cent., and some establishments are stopping. This will throw some out of employment, and they will seek support upon the farm, which alone has bread enough, and work for all.

The prospects for agriculture the coming year are exceedingly promising everywhere, except in the cotton states. We have raised, the past year, the best wheat crop ever produced in the country, and the prices are satisfactory. The corn crop, short in some states, was, on the whole, an average, and the prices high. Potatoes were a very short crop, and the prices higher than for many years. With a few exceptions, everything the farmer produces brings a good round profit on the cost of production, showing that the business can be safely extended. We think, as a rule, our Northern farmers do not employ as much labor as they ought, to make their business profitable. They are content to

rub along, just supporting their families, when they might do this and have a handsome surplus by using more labor. It costs very little more brain work to direct the labors of six men than the labor of one. If there is a profit in hiring one man, there is six times the profit in hiring six, other things being equal. Of course, it requires more capital and more care. There can be no doubt that farming pays with present prices, and we hold that land is profitable just as we expend labor and capital upon it. If any man has any doubt upon that point, let him plant an acre of corn, applying fifty dollars' worth of stable manure, and giving thorough cultivation, and compare the result with little or no manure and poor cultivation. Labor is much higher than it used to be, but farm crops sell enough higher to make up the difference, and leave a margin for profit. We have no doubt that multitudes of our skillful farmers would greatly improve their fortunes by using more labor and enlarging their business. They have skill enough and capital enough, if it were put in the right place. The markets show clearly enough, that we want more hay and grain, more beef and butter, more potatoes and poultry, and that all farm crops pay well for raising. The manufacturer and merchant are very much in doubt about their ventures now, and some are failing. The farmer has no solicitude of this kind. He may extend his business and thrive.

Get skilled labor if it can be had, but if not, use the emigrant. Many who come over have been trained to farm labor, and very soon adapt themselves to our methods. If the farmer can be in the field with his help the most of the time, skill is of less importance. One of the best hands we ever had, began work with us the day after he landed, and staid with us six years. If a green hand has aptness he will acquire skill, and after a few months will be as serviceable at most kinds of work as the best hand. There is no difficulty in getting emigrant labor, in any quantity, and at reasonable prices. Thousands of them come to our shores every month and are eager to secure places. Give them a chance to earn their bread, and to make homes for themselves upon land of their own.

SOFT-SHELLED EGGS.—An English poultry manager suggests the following treatment:

"When a hen lays this sort of egg, and not habitually, the occurrence is generally accompanied with hard or full crop. In that case, it is owing to indigestion, to be treated with one or two teaspoonfuls of English gin. One cause is said to be over-feeding when fowls are too fat. These eggs are generally dropped from the roost, and if it is not too high from the floor, or if they fall on straw, may be saved entire, and used for puddings. As to symptoms, experience will make known the indications, and the time when a hen is about to pass one of these eggs, by appearing somewhat dull and uneasy when walking about; when proper precautions should be taken to secure it, and prevent the other hens from gobbling it up. The writer has a favorite hen, which always regularly drops these eggs from her roost, and never lays any others, and has done so for these five years past, although in perfect health."

Probably the medicinal effect of American gin would be quite as efficacious as that of "English." We give his statement for what it is worth, with the remark that the trouble is usually considered due to a lack of lime in the food, and this is supplied by giving the hens shells, bones, and other forms of lime.

Framing to Secure Wide Floors in Barns.

Wide floors, unobstructed by posts, are often a great convenience in barns, and as it is desir-

TRUSS-BENT FOR BARN.

able to know a good way to frame a bent so as to dispense with posts and make it a self-supporting truss through a part of its length, we have had the accompanying figure engraved. It represents a truss-bent in the barn of Rev. David R. Waller of Bloomsbury, Pa., which supports the second floor of the barn, on one side, and a hay mow upon the other. The barn has two stories and a basement, and all the hay and grain is drawn in upon the second floor, over a bridge, from an approach walled and banked up. This truss is of simple construction, philosophically braced and entirely secure. The size of the timbers would vary with the width of the barn and the extent to which it is self-supporting, as well as with the weight it is expected to sustain.

A MILK PRODUCERS' ASSOCIATION.—Boston people are proverbial for having notions, but it usually happens that "Boston notions" are good ones, as witness a late meeting to form a Milk Producers' Association. We are glad to see any movement that will tend to bring the producer and the consumer nearer to each other, as it results in the farmer getting more for his articles, and the non-producing consumer receiving more for his money. Those who supply the Boston market with milk, naturally enough object to that state of things, in which the producer receives $3\frac{1}{2}$ cents a quart for his milk, which is sold in the city for 8 $\frac{1}{2}$ cents. We quite agree with them in the conclusion that 5 cents a quart is rather too much to pay the middle man. At the meeting in Boston, an organization was effected, by the adoption of a constitution and by-laws, but we fail to get, in the account of the proceedings, an idea of just what they propose to do. But infer that their course will be such as will bring a greater share of the proceeds of the sale of milk into the hands of the farmer. We are glad to see anything that looks like co-operation among farmers, and any indication that the same tact, talent, and energy is obtaining in agriculture that is an absolute necessity in other kinds of business. We cannot see why co-operation in the milk business should work to the detriment of any but the middle men. It would be easy, practicable, and profitable, in any community where milk is supplied to a large city, for the milk producers to make a co-operative or joint stock company, and engage a man of known business talent and integrity to see to the transportation of the milk to market, and its delivery to retailers. We have no doubt that such an organization, well managed, would pay good dividends to the farmers.

ANOTHER FORAGE PLANT.—It was not long ago that the French journals were full of accounts of the *Brome de Schrade*, *Bromus Schra-*

deri, or *Rescue Grass*, over which a great amount of enthusiasm was expended. Now we have one of our wild grasses extolled, under the name of Perennial Millet—*Millet vivace*—as a very valuable forage plant. The grass in question is *Panicum virgatum*, a coarse, reedy grass, that grows in moist, sandy soil; it has long and flat leaves, and an open, large panicle; it grows four or five feet high, and is perennial. The French writer has experimented with a small patch, and though its tendency to form clumps does not altogether suit him, yet he thinks that it is one of the forage plants that furnish the most vegetable matter upon a given space of ground. He states that all sorts of animals are very fond of it; it does not speak very well for the taste of French animals if they fancy such coarse food. Probably the number of our pasture grasses might be advantageously increased, but we doubt if the coarse-leaved and coarse-stemmed *Panicum virgatum* will be one of them.

The Department of Agriculture.

In last month's *Agriculturist* we announced the appointment of Col. Capron as Commissioner, but were very chary of giving him any praise in advance, for we knew we should soon be obliged to find fault with him. We gave him warning that we were watching his acts, but that did no good,—he has acted, and we are "down on him." We learn that the new Commissioner has abolished the seed-shop and seed distribution. Oh! Colonel! now you have done it, and in the name of many injured people we protest. Mortals are weak, and power is a dangerous thing to trust in their hands. We wished you well, but seated in your place only a few short weeks you go and "bust up" the great "National Seed Shop." We protest—in the name of the people in general, or of individuals in particular. We protest in the name of the seedsmen: where else will they be able to dispose of their old stock? What are certain Philadelphia seedsmen to do now, when Lima Beans and Hubbard Squash can no longer be sent forth by the mail as novelties? We protest in behalf of Senators and Representatives in Congress. Where can their poor relatives and other dependants find occupation, now that they can no longer put up seeds? How many votes will be lost at the next election for the want of a few pole beans! We protest in the name of the people, and there is where we have you, Col. Capron. Did you think what a great agency for the education of the people that seed shop was, and how its most practical lessons will now be wanting? When *Echium vulgare* was sent out for a bee plant, didn't the farmer learn the botanical name of one of the worst of weeds, and didn't he have to exercise his ingenuity to get rid of it? When seeds of tropical plants were sent to Wisconsin, did not the farmers there learn the useful lesson that every kind of plant would not grow everywhere?

We protest in the name of the poultry. Many a poultry yard will miss its accustomed variety in food; formerly it was something to be a fowl belonging to a friend of a Senator or a Representative, as several times a year it had food, which if not very good, was at least expensive, and was bought by Uncle Sam's money, was brought by the U. S. mail, and was fed out by a friend of a friend of Uncle Sam. It must be a poor cock who couldn't fancy himself the American eagle upon such food.

Finally, we protest in our own name. An interesting portion of correspondence must

cease. The inquiries as to what are Alfalfa, Bene, Sanfoin, and other things sent out without any intimation as to their uses, will come no more, and we shall no longer have the satisfaction of telling our friends what is food for their cattle and what is food for themselves.

Seriously, Mr. Commissioner, we congratulate you upon having done the only possible thing with the national seed shop. Instead of trying to reform it, you have abolished it altogether, and in doing so you have abolished one of the most unfair, corrupt, and useless parasites that ever sucked blood from the treasury.

More Gates and Fences.

A Maine correspondent sends us sketches of a convenient farm or door-yard gate, which we represent in fig. 1. It is simple, and easily made, as the rollers or wheels upon which it moves are such as barn doors are hung upon, and may be obtained of most hardware dealers, or at well furnished country stores. The gate rolls open and shuts on a line with the fence, and on a perfect level. The latch stile is made of two pieces, and has a wheel at the bottom, as shown in the cut. This may be an iron wheel with a groove, and made to run upon an iron rod; or it may be flat-edged to run in a groove. The hinge style, if it may be so called, has a grooved wheel, or roller, attached to the upper part of it, which rolls upon a rod of iron,

Fig. 1.—SLIDING GATE.

made fast to the upper rail of the fence. The whole contrivance is very simple, and any one with a slight knowledge of the use of tools may make such a gate. It is not subject to be blown open nor to be slammed to pieces by high winds, and the task is much easier to clear away the snow for it to slide back and forth, than to make room to open a swinging gate.

The accompanying sketch of a substantial stone fence is received from the same correspondent, who would, we presume, hardly recommend it as economical for the farmers of the Grand Prairie, however suitable it may be for those who earn their bread upon the granite hills of New England. Figure 2 represents a fence made of granite blocks, each one foot square, and six feet long, set upon blocks a foot in height. The granite or gneiss rock of some

Fig. 2.—A GRANITE FENCE.

sections splits into rectangular pieces with great ease, the cracks following natural planes of cleavage, at least in one direction. This enables those who can procure such stones, to use them as building material, and for fences, either in the way shown, or as posts, iron dowels being set in to support rails. They make most excellent gate posts, and it is often well worth while to be at considerable expense to procure such, especially where the situation is of a character to cause common wooden posts to rot rapidly.

The Bovine Family—The Yak.

Animals of the *Bovine* family are found native in almost all parts of the world, South America and Australia being, we believe, the only countries of any extent having no indigenous oxen. The genus *Bos* includes all the animals properly called bovine. They are all distinguished from other ruminants by smooth, hollow horns, directed more or less sideways, and curved upwards or forward, in a semilunar form; bodies, thick and heavy; tails, long and terminated by a tuft; udder, between the hind legs, and having four teats. The males are called bulls, the females, cows, and the young, calves, whatever the species. A considerable degree of confusion has existed among naturalists in regard to these animals, and they have been forced to base specific distinctions upon characteristics which in the different varieties of domesticated species vary greatly. The species now included by naturalists in the genus are the following:

1st. The Urus, or Aurochs, or Bison, *Bos urus*—nearly extinct, closely related to the American Buffalo. One fine herd is preserved with great care by the Emperor of Russia, in the forest of Lithuania in the province of Grodno.

2nd. The American Buffalo, *Bos Americanus*. Distinguished by a flat, fleshy hump upon the neck and shoulders, caused by a prolongation of the spines of the backbone, and a long, shaggy coat.

3rd. The Gyal or Jungle ox, *Bos frontalis*,—a domesticated race closely resembling the common ox, existing in the mountainous districts in the north-eastern part of India.

4th. The common ox, *Bos taurus*.

5th. The Buffalo, *Bos bubalus*. Distinguished by horns turning backward, a rounding forehead, no hump, little or no dewlap, and a slender, tufted tail. Found both wild and domesticated in Southern Asia, and domesticated in Asia, Southern Europe, and Northern Africa.

6th. The African Buffalo, or Caffer ox, *Bos Kaffer*. Distinguished by horns very broad at base, transversely wrinkled, and of great size; the animal is the largest of the ox family, ears large and half pendulous, hair prevalently short, but shaggy about the fore quarters.

7th. The Yak, or Grunting ox, of Thibet and

Tartary, *Bos grunniens*. This is an exceedingly interesting animal, and it is to be regretted that so little is known from which an accurate idea of its economical value can be determined.

There are both wild and tame varieties in the mountains of Thibet. We present a picture engraved from the photograph of a bull in the botanical and zoological garden of Paris (*Jardin*

botaniques, and, taking color easily, they are dyed of all gaudy hues. They are, besides, used by the Governors of provinces under the Turkish Government as badges of rank, two or three being borne upon a spear before the officer, who is known as a "Pasha of two tails," or of "three tails," as the case may be. Tails of white horses are also used, but those of the Yak are

preferred, being more costly and beautiful. (See "Basket" item.)

There are several varieties of this animal in Central Asia, and these varieties are so great as only to be accounted for by travelers on the supposition that they have been crossed with domestic cattle or with the zebra of India. Our knowledge of the facility with which crosses with the buffalo are made renders it probable that this species, which, in some respects, seems still more closely allied to the domestic ox than the buffalo, may be capable of

being similarly crossed. Some Yaks fully equal in size large oxen; others are not much larger than sheep. In some the hump is covered with a full mane, or rather great masses of soft, long hair; in others there is comparatively little. All have the flowing tail and more or less of the long silky hair, which is put to various uses, being spun into ropes, or spun and woven; the fine hair of some varieties being also used for textile fabrics of great beauty. The introduction

of the Cashmere or Angora goat, about which there is now so much stir in the country, indicates an interest in animals of long silky fleeces which leads us to commend the Yak to our enterprising importers.—As a beef, dairy, and laboring animal, all we know of the Yak is, that its flesh and milk, (butter, etc.,) are said to be good, as used by the Asiatic mountaineers; and though seldom worked in the yoke it is much used as a pack and saddle beast, being sure of foot and quite a rapid traveler.

There have been a few introduced into this country, and one, we believe, is still living, and in a menagerie.

The Cattle of the Channel Islands.

Wherever domestic animals within a limited district are subjected to similar circumstances, being bred and used for the same purpose, the characteristics and looks of different animals

THE YAK OF THIBET.—(*Bos grunniens*.)

des Plantes). This shows the general characteristics of the species better than we can describe them. The body is deep, the shoulders high, and the height increased by a hump, which gives an undue appearance of lowness to the rump, the head broad, covered with thick hair, the horns being much like those of the common ox. The legs are short, but the long hair makes them look shorter than they really are. The neck, dewlap, and sides, are covered with long

JERSEY BULL, "JUPITER," PROPERTY OF RICHARD M. HOE.

hair of a silky lustre, while a coat of fine hair covers the entire body. The hair of the mane, back, and tail, is peculiar, being finer and more silky. In the Royal Yak the color of the head, body, and legs, is black, while the hair of the mane, back, and tail, is of a brilliant white. The Yak has a tail much resembling that of a horse, and these tails are in great request among the wealthy residents of India and China as fly

gradually become very much alike. In this way all the breeds of cattle and sheep have been established, and it is usually the case that such a breed of animals is peculiarly well adapted to the uses of the district in which it is formed, (better, indeed, than to any other), and that it loses more or less of its distinguishing characters when removed. In the place of its nativity, a breed is therefore prized; and the views taken by intelligent breeders establish a uniformity of taste, in color, size, and points, which after a few generations give rise to differences between the cattle in contiguous valleys, or islands, as in the case of the Channel Islands. To a close observer noticeable peculiarities are usually seen even in the cattle of neighboring parishes, or even farms, if the herds have not been much crossed.

The group of the Channel Islands consists of six, the principal of which are Jersey, Guernsey, and Alderney; Jersey being the largest and Alderney the smallest. This group, which is subject to the British crown, lies in the bay of St. Michael, off the coast of Normandy and Brittany in the North of France, and is famous for butter, cider, perry, and parsnips, and for a race of peculiar cattle distinguished for the richness of their milk.

The original stock from which the different breeds into which this race has become naturally divided sprung, was doubtless from the adjacent main-land, and was, perhaps, also essentially influenced by animals brought from a distance which might easily have been landed from ships touching at the islands. Since the cows of these islands have become so valuable and sought after in foreign countries, the greatest jealousy has sprung up that no taint of foreign blood should be justly imputed to the breed of any farmer; so that now the cattle of each island, particularly of Guernsey and Jersey, have been quite free from any foreign intermixture for many years, and every year their characteristics are better defined.

Dr. Twaddell, in an account of a visit to the islands given before the Philadelphia Agricultural Society not long since, said that there are 3,000 Jersey, and 1,200 Guernsey cows, exported from the islands every year.

The name Alderney, frequently given to this breed, is essentially a misnomer, for it is admitted that the cattle of the island of Alderney are a mixture of Guernseys and Jerseys, and not of so uniform a character as those of either, and hence not entitled to be considered a distinct breed, and certainly not to give the name to the breed which is found so much more uniformly characterized upon the island of Jersey.

We present an engraving of a fine bull belonging to Col. Hoe of Westchester County. It was accurately copied from a photograph, which will account for a little stiffness of position.

Walks and Talks on the Farm.—No. 50.

"What is the best kind of cow for me to keep," asks a suburban friend, "the object being to get good rich milk without special regard to quantity?"

It would seem an easy matter to answer such a question; and, indeed, I replied at once "Alderney." But further conversation led me to the conclusion that the Alderney, instead of being the best, would be one of the worst cows, for my friend to buy. In the first place, he could keep but one cow; and in the second, he wanted milk every day in the year. In such circumstances no other plan can be adopted except to buy a milk cow and keep her as long as she

gives the requisite amount of milk; then sell her and buy another. A grade Devon would perhaps be the best of all cows for such a purpose. She gives rich milk, and with liberal feeding, would steadily improve in condition, and could be sold to the butcher for as much as she cost. I have known a cow of this kind to give milk every day for five years, and then be worth for beef a good deal more than she cost.

The fact is, we may as well give up talking about thorough-bred cattle for ordinary purposes. The real question is, not whether the Short-horn, Devon, or Hereford, affords the best beef at the least cost, but which breed gives us the most valuable "grades" when crossed with common cows. We understand pretty accurately the merits of the different breeds, but little is said in regard to the qualities of their grades. Of course when we know the characteristics of the thorough-breeds, we can form some idea of the merits of their grades, but there are questions in regard to them that need to be more fully discussed. I can easily see how a Short-horn grade from one of our best native milk cows would give more milk than a thorough-bred Short-horn cow.

Mr. Willard, of Herkimer County, was here last week, and we had a long talk about dairy matters and his visit to England. He found, what I have always asserted, that in the mechanical appliances for making cheese we are far ahead of the Cheshire farmers. Our best factory cheese is also better than the Cheshire cheese and brings a higher price. In Cheshire little or no grain is raised. The land, as in the dairy districts of this State, is devoted almost exclusively to grass. But in the Cheddar cheese districts more grain is grown, and the farmers pursue a mixed system of husbandry. The farms afford a much larger aggregate amount of produce. They keep as many cows on a given area, and get a considerable amount of grain besides; and the cheese brings a higher price. I want to see the same system tried in the grain growing districts of this State.

One thing surprised me. It seems that the general system adopted in Herkimer County is, to keep the cows as long as they give a fair quantity of milk—say till they are 12 or 14 years old, and then sell them for "barrelers." Cows that in their prime were worth \$100 a head are kept till they are "used up," and then sold for \$5, \$8, or \$10. Many such cows have been sold the past few months for \$5 a piece. Now it will become an outsider to condemn a practice adopted by intelligent farmers after many years of observation and experience. It is fair to presume that there is, or has been, a good reason for the practice. I can understand how such a system originated. When new milk cows could be bought for \$25 a head, and good beef was worth only 2 cents per pound, live weight, it would not pay a dairyman to keep cows with reference to anything else than the amount of butter and cheese that could be forced out of them. I have known the owner of a saw-mill, when the slabs accumulated to an inconvenient extent, to take out the machinery from the mill and set fire to the whole thing, and then rebuild on the clear space. This was the quickest and cheapest method of getting rid of the slabs. So too, when my farm was cleared, eight acres of the heaviest timbered land was chopped down and set fire to in a single year. It was probably the best thing that could be done with it. At the present time such timber would be worth four hundred dollars an acre. Now what

would be thought of a farmer who was so wedded to old customs as to continue this method?

Choice beef now commands a higher price in the markets of New-York, Boston and Philadelphia than in any other city in the world. Do we fully comprehend the bearing of this fact on our agriculture?

Last week I was in New-York and went to the old Bull's Head Market (now removed up to 100th street). It was the Monday before Christmas, and yet the quality of the cattle was, as a general rule, of the poorest description. It was a soft, rainy day, and one of the salesmen remarked: "They've got us to day; last week we had them." Prices fell half a cent to a cent per pound. And yet I saw one pair of six year old cattle sold for \$500, or 20 cents a pound, "estimated dressed weight." They were large, coarse, grade Short-horns; not by any means of choice quality, but very fat. I have a grade Hereford cow, six years old, that has been giving the richest of milk all summer (though not in large quantity) that would now make far better beef than these steers. She has fine bone, thin skin, handles superbly, and has a great tendency to fatten.

It takes more food to produce a pound of cheese than a pound of beef; and yet the latter commands the higher price. There is danger of glutting the cheese market; there is no present danger of glutting the beef market. We are brought into competition with all other nations in the production of cheese, while we have a monopoly of the best beef market in the world.

Suppose a dairy farmer raises his own cows. They prove to be good milkers, and he keeps them till they are twelve and a half years old, and then sells them for \$10 a piece.

The heifer comes in, say at two and a half years old. Up to this time she has cost, say \$50. And after that her keep, say, costs \$50 a year for ten years; or \$550 in all. She produces, say \$75 a year for ten years, and sells for \$10; or \$760 as the total produce. Profit \$210.

Take the other system. The heifer comes in at two and a half years old, as before, and has cost \$50. You then keep her till she is eight years old; say five and a half years keep at \$50 a year, or \$275, or \$325 in all. She produces \$75 a year for five years, or \$375, and then sells for \$80 to the butcher, or \$455 in all. Profit \$125. Another cow then comes in, costing the same and producing the same.

The profits are \$250 in the one case against \$210 in the other. But this is not all. The old cows do not give as rich milk as the younger ones. And it is worthy of consideration whether the calves of such cows are as strong and healthy, and whether they are not more subject to disease. Milk being the only object, there can be little doubt that the dairymen select heifers from cows that are "deep milkers," and also use males from the same stock. The dairyman uses all his skill to induce a great flow of milk. He does not ask which is the most nutritious food, but which will give the most milk. Health, strength, vigor, constitution; fat, flesh, and bones, are all sacrificed, if need be, for milk. Breeding, feeding, treatment, all aim at milk. Many of our so called native cows have no equals in the world for milk. We have cows that produce 600 pounds of cheese in a year, and a hundred pound calf besides. Such a cow has great digestive power and being fed liberally may herself stand this enormous drain, but it will inevitably tell on the offspring. As "like produces like," the tendency to produce milk is there, but not the strength to stand it. What is

the result? "The sins of the fathers are visited upon the children." The cow lives, but the calf dies. This result happens so frequently as to threaten the destruction of the dairy interest of the State. I do not say that this is the only cause of the prevailing epidemic, but I have little doubt that this practice of keeping cows till they are used up; feeding them with special reference to the production of large quantities of milk; and rearing calves from cows whose constitution is undermined, is probably one of the principal causes of this alarming disease. Of course the effect may not show itself at once, and when it is seen it may not be easy to trace it back to its cause. At all events, the practice of keeping cows till there is little left except the hide and bones, is not in accordance with sound economy, and Nature, sooner or later, always punishes those who waste her products.

"What system would you adopt? On our high-priced land we cannot afford to raise grain and hay to fatten cows in the winter."

"What are your farms worth?"

"One hundred and fifty to two hundred dollars an acre."

The more your farms cost, the better will it pay to adopt high farming. In fact, I do not see how any other system can be profitable. If a man pays \$10,000 rent for a store on Broadway, he must do more business than the man who pays only \$500 for a similar store in a country village. So in farming; high-priced land must be worked up to its maximum capacity. You can afford to pay much more for manure that will double the crops on land worth \$150 an acre, than on land worth only \$50.

Mr. Willard says that the farmers in Cheshire, by boning their land every dozen years, are enabled to keep one-third more stock. On cheap land, this might not pay, but on land costing \$150 per acre, (the simple interest on which, in a dozen years, comes to \$126,) it would be highly profitable. And it must be observed that the increase of the grass does not represent the whole benefit. The probabilities are that the grass itself is of far higher quality, and would produce much more cheese.

I did not know it, but it seems that one reason of the superiority of Herkimer County pastures, is their tendency to grow clovers. The more white clover the dairymen can get in their pastures, the more highly they esteem them. I can readily see why this is so. The clovers all contain about twice as much nitrogen as the grasses, and it is equally certain that milch cows require more nitrogen in their food than fattening animals. And it must be quite an object to increase the proportion of clover in their pastures. I think I told you of a remark the Deacon made last summer. On the west side of my house is a poor sandy slope. It is so light that the west winds drive the sand in clouds into, and almost over, the house. At the bottom of the slope was a quagmire. A couple of underdrains running up the slope, remedied this. They tapped several springs, and carry off large quantities of water. The land was very foul, and poorer than poverty. I cultivated it for two years with root crops, for the purpose of killing the weeds. Having no manure, I dressed the land liberally with raw-bone superphosphate and phosphatic guanos. A finer crop of turnips than this land produced, I have rarely seen. I then sowed it with barley, and seeded it down with red-top, Kentucky blue grass, and Timothy. The barley was a light crop, and the grass did not "catch," except on the low land. Last spring, I sowed more grass

seed, but the season was so dry, it did not thrive. But there was an occasional root of white clover, say two or three feet apart. By the middle of summer, it had nearly covered the ground, and I am satisfied that by next year the whole slope will be covered by a thick sward. "Well," said the Deacon, as he rode past, "I would like to know what you have done to that land. It's the first time I've seen white clover there for thirty years." "I have killed the weeds, and put on plenty of phosphates." Now, the Deacon has no faith in artificial manures, though he believes in plaster, ashes, and hen-dung, and spends as much time in gathering, pounding them up, mixing them together, and dropping them on the hills of corn, as would pay for a full equivalent of a good artificial manure, and so it would not do to let the matter remain in this shape. "There seems to be a good deal of white clover everywhere this season," he said, as he touched up old Prince with the whip, and drove off.

There can be no doubt that enriching the land, either by hoeing or by manuring, causes it to grow richer grass. And it would be well for the dairymen, as well as the rest of us, to enquire whether our pastures might not be greatly improved by top-dressing; and that not so much in the yield per acre as in the quality of the grass. We have a clear apprehension of the importance of getting a good bite of grass, but many of us seem to forget that a hundred weight of one grass may be worth for keeping up the flow of milk and the vigor of the cow, as much again as a hundred weight of other grass.

"But you have not told us what system you would adopt."

I have no intention of doing so, except so far as to say that "high farming" would prove a remedy for most of our agricultural troubles. The details must be governed by circumstances. I will tell you what I would *not* do: I would not keep a two hundred acre farm, worth \$30,000, and have on it a good stock, worth \$5,000 more, and then not employ more than a thousand or fifteen hundred dollars capital to work it with. I would not let a stream of water rush uselessly down a side hill, when a little labor would distribute it over acres of parched pasture land, and make it produce threefold more grass than at present—the consumption of which would furnish an extra quantity of manure. I would try hard not to have weeds starve out the nutritious clovers and grasses. I would not exercise years of intelligent care and effort in selecting and breeding cows that are capable of turning large quantities of nutritious food into butter and cheese, and then let them get so poor, by the end of the season, that a high wind would blow them over.

The fact is that these "high priced lands" do not keep half the stock they ought to keep. On Mr. Horsfall's farm of sixty acres, there were kept, when Mr. L. H. Tucker visited it, 20 milch cows, 21 heifers and bullocks, 64 large mutton sheep, 106 lambs, 4 pigs, 2 horses and a pony, or 218 head in all.

Forty-three acres of the land was in grass; 2½ acres wheat; 4½ acres root crops; 3½ oats; and 3 acres beans. The secret of his success is in the large quantity of rich manure that he makes and applies as top-dressing to his grass land. He makes this rich manure by feeding his cows and other stock in the most liberal manner. His hay and grass is of the richest quality, and besides this, he feeds oil-cakes and other purchased food. "The whole of my meadow land," he says, (in the *Journal of the Royal Agricultural Society*, Vol. 18, page 181,) "re-

ceives a dressing of manure once a year. * * * In addition to this yearly dressing with excrement, I apply guano at the rate of 2 cwt. to each acre." "But will such a system pay here?" Why not? "Labor and taxes are so high." That is precisely why we must adopt high farming. It requires far less labor, *per ton*, to raise three tons of hay per acre than one ton. Recollect, we are getting high prices.

"Mutton is cheap."

True, but what mutton? Mr. Judd, who has just returned from an extended tour in Europe, remarked to me last week: "Give us such mutton chops as I ate in England and, (to my surprise,) in Russia, and I will insure you 20 cents per pound." In fact, choice South-down mutton now brings 18c., 20c., and 25c. per pound by the carcass in New York, while half-starved, common sheep are slow of sale at 3c., 4c., and 5c. per pound. And, in fact, thousands are being slaughtered in this section, and boiled up for the tallow. The legs are saved for food; the rest, after being pressed, is fed to hogs.

We are making a great mistake, however, in killing the sheep. The prospects for profitable wool growing were never better than at present. I did all I could to stop my friends from going into "gas-train merinos" during the late excitement. I foresaw the result, as did many others. But it is not too late to correct the mistakes that have been made. The American merinos, so called, have some admirable qualities that can be turned to good account. A sheep that has the power of secreting 10, 15, and 20 pounds of yolk in a year, and 5 or 6 pounds of such a highly organized product as fine wool, must possess great vigor, a magnificent constitution, and splendid digestion—qualities too rare and too valuable to be sacrificed. In the hands of such a man as Hammond, animal life is as plastic as the potter's clay, and there is a fine field for the hundreds of young American Bakewells, and Ellmans, and Webbs, and Hammonds, to enter at the present time, and win fame and fortune.

Broom-corn.

Every one whose memory goes back to the Age of Homespun, recalls broom-making as one of the brightest scenes by the farmer's winter fireside. The chief operator was not uncommonly a negro, who made this his main business during the fall and winter. With his bundle of white oak splints, bodkin, knife, and cord, he went from house to house, manufacturing the annual stock of brooms. Every farmer raised his patch of broom-corn with as much regularity as his corn and potatoes. There were no brooms in the market, and the sole reliance for this indispensable article of housekeeping was the home-grown article. The broom-maker followed the cobbler in his annual round, and stocked the garret or kitchen loft with a goodly pile of brooms. The old-style broom was not the broad, flat article, now in the market, but one larger and more clumsy, invariably round, and bound together with narrow strips of wood.

The handle end was left untrimmed, to be finished off after the handle was inserted. This was a round stick, usually of chestnut or ash, made square, and pointed at one end; it did duty for many generations of brooms. The use of turned handles, and of threads and wires, and the flattening of the brush to give a wider sweep, are modern devices that came later.

But the age of homespun has past, and we have to draw upon memory for the old style of

broom that hung on a nail in the corner of our grandmother's kitchen. The patch of broom-corn is not so common in the farmer's garden, and the wandering broom-makers and cobblers have gone the way of all the earth. The housekeeper draws upon the country or village store, or upon the pedler, for her supplies, or buys her annual stock in the large city markets. Even those very convenient articles for cleanliness about the kitchen hearth, the pressed wings of turkeys and geese, have been driven out by the whisk brooms of the factories. Broom-corn has become a specialty, and is raised on a large scale in some localities, like tobacco, hemp, and bops. As so many housekeepers depend upon the factory-made article, the consumption is very large. This crop, though not so profitable as some others, is yet a very good one for soils that are well adapted to it. The crop has no unusual dangers or enemies, and the prices for the brush are quite uniform and remunerative.

The soil usually selected is a well drained, sandy, or gravelly loam, quick and fertile, such as is found in many of our river bottoms. Reclaimed muck swamps and bottom lands, with a large share of vegetable deposit, are found to make too rank a growth of leaf and stalk. If uplands are selected, they should be well drained and rich in alkaline salts. The crop will grow in any land that will mature Indian corn, but might not prove remunerative. It is particularly important that broom-corn should be grown upon clean land. When the blade first appears, it is very small and hardly to be distinguished from some kinds of grass, and it remains in this feeble condition for two or three weeks. In foul lands, the expense of cleaning and cultivating is very much increased. It is on account of this weakness of the plant in the early stages of its growth that manuring in the hill or drill is particularly desirable, to push it along rapidly and make it show above the weeds. This fertilizer may be horse, hog, or sheep manure, well rotted and made very fine, or any of the concentrated fertilizers that have a fair share of ammonia. If the plants are backward, apply ashes and plaster at the first hoeing, and after as they need. The rows are planted from 23 to 36 inches apart, depending somewhat upon the character of the land and the views of the cultivator. If the land is rich or very well manured, it will bear thicker planting than poor land, or, if the grower desires very fine brush, he will plant thick. The seed is sown either in drills or in hills, about three times thicker than Indian corn. If in hills, plant 2 feet apart and thin out to seven or eight plants in a hill at the second hoeing. If in drills the plants should be thinned out to about five to the foot. The cultivation should be frequent and thorough, going through the rows with the cultivator as often as once a week, until the plants are too high to admit of the use of horse-power. The success of the crop depends very much upon this thorough cultivation, and with improved implements this may all be carried on with horse-power after the first weeding. Suckers will start from many of the plants, especially from the dwarf variety, and these must be removed by hand until the brush begins to show. When the seed is just past the milky state, it is time to bend over the

tops. This is done at any height that is convenient for the operator, but a foot or two from the lower end of the brush is the rule. Two rows are taken at a time, and the tops are bent over toward each other. Sometimes the tops are left at right angles to the main stalks, lapping upon each other, and this is called "tabling." When the brush is cut, it is laid upon this "table" for partial drying. Others bend the tops clear over at a sharp angle. Others, still, cut up the stalks near the root and in this case the brush is subsequently cut off with about four

THE SPINY CLOTHUR.

inches of the stalk, bundled, and laid up to dry under cover. Much of the value of the crop depends upon skill in drying. Some have sheds or barns especially for this purpose, somewhat upon the plan of a tobacco house, with ample facilities for ventilation. All that is wanted is protection from the rain, with a free circulation of air between the layers of brush. Many who have small crops build rail pens, arranging poles upon the interior for spreading the brush. The best brush is dried under cover, and should be of a bright greenish color, elastic, tough, and straight. If the brush has stood too long in the field, it is of a reddish brown, and brittle. The seeds are removed by a hatchel, made for the purpose, by the small cultivators, while the large planters use a horse-power machine. The seed being gathered before it is fully ripe, is apt to mould and ferment, unless spread upon a large floor and frequently stirred. This varies in price from fifty cents to three or four dollars a bushel. It is valuable as a feed for poultry, or it may be ground up with other grains and fed to swine and cattle. It is an important item in the profits of the crop, and should not be wasted.

In raising seed to plant it should have full time to mature upon the stalk, and the growing crop should be kept at a distance from any Chinese sugar cane, or Imphee. Seed should be saved only from the toughest, finest, straightest brush, grown under these favorable circumstances.

There are two varieties in common cultivation, the tall and the dwarf. The latter is decidedly the preferred in the market.

With good land and cultivation, about five or six hundred pounds of brush are grown to the acre. Sometimes a thousand pounds are reached, but this is an exceptional crop. The market price varies from five to ten cents a pound. At the highest price, it will be seen that about fifty dollars an acre can be expected for the brush, and if we put the seed at half as much, it will only make seventy-five dollars as the gross receipts from an acre. The stalks are only valuable for manure. This crop can only be regarded as fairly remunerative, and should not be attempted except where the land is particularly adapted to it. It is quite extensively cultivated in the valleys of the Genesee, the Mohawk, and the Connecticut, and those persons in the West and South who are thinking of trying it on a large scale upon their river bottoms, should visit these localities before entering upon the enterprise. It is estimated by a prominent dealer in the article that about 5,000 tons are raised in the whole country. The Shaker, or dwarf, variety is principally raised in the Mohawk and Connecticut valleys.

A Bad Weed—The Spiny Clothbur.

Last autumn, while riding in the vicinity of Cincinnati, we saw by the roadside a plant of the Spiny Clothbur. Having never before seen this far away from salt water, we were as much surprised as we would have been to see sea-weed in the Ohio River; but the plant has found its way to other parts of the West, as is shown by a specimen since received from a correspondent in Michigan. Believing that every farmer should take an interest in his enemies as well as in his friends, both among plants and animals, we give an illustration which will enable this foreigner now on his westward travels to be recognized at once, and hope that all good cultivators will see that he does not reside long enough with them to be able to get his naturalization papers. Along the sea coast the plant is not very rare, and it seems to affect old fields and waste places. There is some doubt as to the native country of the Spiny Clothbur, Southern Russia and tropical America dividing the honor between them. It is one of those plants that are remarkable for becoming naturalized in widely separated countries. The first recorded appearance of the plant is in 1818, about which time it was found around Savannah and other southern cities; some years later it appeared in Pennsylvania, and in the course of time worked—or rather stole—its way as far north as Massachusetts. It is now on its western travels, and we believe that the localities we have given are further west than have been recorded before. But how does it travel? For the most part, just as other travelers do, by public and private conveyance. Wherever ships discharge their cargoes and ballast, there we find foreign plants, and wher-

ever railroads penetrate a country, we have the facilities for the transportation of weeds. Some of these plants seem to follow the white man wherever he goes, a fact which the savage long ago observed and gave to a common weed the expressive name of "White man's foot."

The plant is much branched, 3 or 4 feet high, with rather slender stems. The leaves with the sharp, yellow, 3-parted spines at the base of each, and the oblong bur, are given of the natural size in the engraving. This bur contains two seed-like nuts resulting from two pistillate flowers; these are enclosed in a covering or involucre, which, as the fruit ripens, becomes hard and the hooked prickles become very stiff. The staminate flowers are borne in separate heads upon the same plant. The botanical name of the plant is *Xanthium spinosum*. The generic name is derived from the Greek word for yellow, as it is said that some of the plants yield a yellow dye. As to its specific name, *spinosum*, we might say that it named itself. The common Clothbur, or Cocklebur, is another *Xanthium*, and is well known to every farmer's boy who has had to pick its prickly burs out of the tails of horses or the fleeces of sheep. The burs of the present species show a similar persistence in clinging, but it is a little fairer than the other in presenting its thorns to warn the animals off. Fortunately the plant is an annual, and if attended to when it appears, need not become established. It can readily be identified before the seed has formed, and when once cut down will not spring up from the root.

Rotation of Crops.

In forming plans for the future improvement of the farm, a good rotation is of the first importance. The neglect of this is ruining the virgin soils of the West. Continued wheat cropping has diminished the wheat yield one half or more. States and Counties that once averaged twenty to twenty-five bushels to the acre, do not now average more than ten or twelve. The rotation in the grain districts of Pennsylvania is convenient, simple, and has borne the test of long experience. It keeps up the yield of wheat to twenty-five bushels to the acre, and corn to forty or fifty. It is as follows: 1st year, corn upon a sod, limed in the early fall, and turned over in the spring, or turned over either in the fall or spring, and the lime spread upon the inverted sod; 2d year, a crop of oats, or a summer fallow, with all the manure spread in the fall; 3d year, winter wheat, with six quarts of timothy to the acre, at drilling, and six pounds of clover seed, the following March; 4th year, a crop of clover for hay, and a second crop for seed; 5th year, timothy for one, two, or three years, according to the strength of the land. The aim is to keep up the land to a productiveness of two tons of hay or more to the acre, and if it falls below this, it is an indication that more lime and manure is needed.

A common rotation in Canada is: 1st, wheat; 2nd, clover for two years; 3d, fallow; 4th, wheat; 5th, oats; 6th, peas; 7th, a bastard fallow; 8th, wheat; making three crops of wheat in eight years. But the land runs down under this treatment without manure, and this must come in as a part of the rotation in any improving system, upon ordinary land. And even upon the prairies and bottoms, where they get forty bushels of corn in constant succession, it would pay better to use manure, and get eighty or ninety. In the older States, where grain is raised with less profit, manure is still more important, and is the foundation of all successful husbandry. Manure should accompany every hoed crop, or be used in large quantities, once in a rotation of five years. Hay is a very valuable crop, and with sufficient top-dressing or irrigation, land may be kept constantly in grass. It always needs more manure when it falls short of two tons to the acre. There is a handsome profit in raising this quantity of hay to the acre, but one ton is a very poor business. In any system of rotation for Eastern farmers, potatoes, oats, and hay, should have a place.

The "New Forage Plant"—*Lespedeza striata*.

For some time past the papers published at the South, both agricultural and others, have had accounts of a remarkable "new plant" which had made its appearance spontaneously and multiplied rapidly. It seems to have a wonderful vigor, as it not only occupies waste places, but has taken possession of old fields and crowded out the weeds. Even the Bermuda grass, so difficult to eradicate, disappears before it. Among the names that have been given to it is "Little Wild Clover," but it is not a clover, and it was only when specimens were sent to Prof. Gray at Cambridge, that its proper name became known. Prof. G. determined it to be *Lespedeza striata*, a plant heretofore known only as a native of Japan and China. We have several native species of *Lespedeza*, which have the popular name of Bush Clover, and that would answer very well as a common name for this plant; at least, better than "Japan Pea," by

which name it has been called in some papers. It is really neither a clover nor a pea, though all three belong to the same family. It is supposed by some that this plant was introduced into the Southern States during the war, but a note by Prof. Gray in the *American Naturalist* for

LESPEDEZA STRIATA.

November, states that it was known to Prof. Darby of Georgia, ten years ago; and Mr. G. H. Cartledge says in the *Southern Cultivator* that it was observed by him ten or twelve years ago. That a plant from such an out of the way country as Japan should make its appearance in Georgia is certainly strange, though it is not so unusual, that, when once introduced, it should show great vitality and crowd out other plants; we have numerous instances of this in many other introduced plants. It is supposed that the war had much to do with the general distribution of the plant, and that the passage of cavalry and large droves of bees aided its dissemination. The fact that in new localities it first makes its appearance along the road sides gives probability to this view. A correspondent, whose name we have unfortunately mislaid, sent us a specimen, from which we have had an engraving made, showing the top of a plant of the natural size and a seed pod magnified. The plant was first described in Thunberg's *Flora of Japan* (1784) as *Hedysarum striatum*, and afterwards Hooker and Arnott in the *Botany of the Voyage of the Beechey*, placed it in the related genus *Lespedeza*. Hooker and Arnott describe it as an annual, as does Mr. Cartledge, above referred to; while Prof. Rains, who gives a chemical account of it in the *Southern Cultivator* for November, speaks of it as a perennial. The plant grows a foot or more high, and bears three-parted leaves which are not very abundant. The flowers are small; one is borne in the axil of each leaf and followed by a small, one-seeded pod. The agricultural value of the *Lespedeza* does not seem to be satisfactorily determined. Mr. Cartledge says: "It is, without doubt, a valuable plant. All kinds of stock and fowls are fond of it and thrive well when and where it is plentiful. Chickens will scratch after the seeds and keep fat all winter where they are abundant. It will grow well in a pine thicket where nothing else will grow." Some say that it is eaten only by cattle. The chemical analysis above referred to shows that it ought be a nutritious food, but the writer thinks the woolly stems will prove an obstacle to using it as cured fodder, unless it be cooked.

A Kansas Corn Crib.

We venture to say that the corn crib here represented is the best in the State of Kansas—at any rate, it is a good one, planned and built by an Ottawa Indian, John T. Jones, familiarly known to Kansas people as "Ottawa Jones." The excellent example the "red skin" sets to his "pale face" brethren, will be appreciated by all familiar with the rail-pen cribs almost universal at the West. The corn crib will save grain enough from the rats to pay its cost in a very few years. Mr. J. P. Brown, of Ottawa, who sends us the sketch, describes it as 16 feet wide, 25 feet long; having a drive way through it, approached on either side by an inclined plane, connected with the building by a draw-bridge, shown raised in the engraving, and forming part of the door. The posts are two feet square, protected by zinc caps extending 8 inches on all sides. The sides of the crib are upright slats placed an inch and a half apart.

This arrangement has the advantage over most other plans which we have commended to our readers, of affording abundant floor room for shelling, etc., for the corn must be stored in slatted bins around the sides, or spread upon the floor evenly, one or two feet thick, to be sure of its not being injured by heating.

To us it seems that the most important aspect of the plant is the possibility that it may supply the place of clover as a crop to turn under as a fertilizer. Clover has been the great want of Southern agriculture, and if its equivalent shall be found in the *Lespedeza*, it will be a blessing. We hope to hear more of the "new plant."

Cross-Cut Drag-Saws.—30 Years' Experience.

"Thirty years' experience in the use of drag saws!" We conclude our correspondent,—Mr. Linville Ferguson of Fay Co., Ind.,—is one of the real western pioneers, in whose track the mighty forests of the then West reeled and fell, whose ringing axes and rasping saws made the wild music of the wilderness. The drag saw is the pioneer's companion indeed, but it is of even greater value when the forests are gone, and wood worth too much to have the logs cut and "butted" with the axe in preparing them for the saw-mill. Mr. F. writes as follows:

"If you please, I will give my conclusions, after 30 years' experience, with cross-cut saws, as to the best kind and the best mode of keeping them in repair.—The best drag-saw I ever met with, and I have seen several matched sawings at County and State fairs, will cut off a

Fig. 1.—TEETH OF DRAG-SAW.

log, 2 feet in diameter, of green hard wood, in 45 seconds, and saw 75 cords without dressing, it first being put in order. It is six and a half feet long, one eighth of an inch thick, stretched in a frame. Fig. 1, represents the shape of the teeth. There are two side cutters to one clearer. The clearers are dressed square, are very slim, and one-twentieth of an inch shorter than the side cutters. The side cutting teeth are dressed chisel-pointed, the point being uniformly about one-twentieth part of an inch in width.

"Fig. 2, represents the best "toothing" cross-cut saw, as it will be seen that it saves one-half the filing, giving the advantage of long teeth.

The best shaped saw is straight on the back and very rounding on the cutting side. The advantage derived by using a very rounding saw, and giving it a rocking motion in sawing off a log, is the same there is in cutting a board with a hand saw, by sawing on the edge instead of on the broad side. The teeth should not be cut so deep at the ends, as in the middle, as it weakens the blade unnecessarily. Six and a half feet is the best length for general purposes.

"In dressing a saw, put it end ways on a bench, prepared so as to clamp it the proper height to suit the operator while standing.

Fig. 2.—TEETH OF "TOOTHING" SAW.

First take a straight-edge, made of hard wood, two and a half feet long, and a riveting hammer; place the straight-edge on the teeth very lightly; be careful to keep each end the same height above the teeth; then, keeping the general curvature of the saw, batter down the points

that are too long. The clearing teeth should be hammered down as far as they will go. If the teeth are too long, file on the upper side, and pare the tooth over toward the hook side, and so repeat until the desired length is secured. Never dress the hook side only. The "facing up" should be done with a half-round file. The clearing teeth should be about one twenty-fifth of an inch shorter than the side cutters. The teeth should be kept in the same shape that they were at first. It is all false philosophy that a wide sloping tooth will cut fast; the slimmer the tooth is, if the metal will stand, the better. Care should be taken in filing, to keep the wiry edge of metal dressed off, in order that the tooth be not dressed too much.

Fig. 3.

"In setting, place the saw in a vise, if it is to be had; if not, set a piece of timber in the ground firmly; saw a kerf in the upper end, so as to receive the back of the blade in the middle, giving the kerf only sufficient depth to hold the saw. A wedge or two will hold it firmly.

"The guage is made of an inch board, 5 inches long and 4 wide, of the form shown in Fig. 3. It has three screws set in evenly, from the side that goes against the saw blade, and one passes through from the other side at the top. The point of this screw is cut off, and its length regulated. By turning it back or forth the desired amount of set is obtained. Never use a wrench to move a tooth, as it does not do the work well, and by having to move the tooth further than necessary, it is liable to break it. Take an iron wedge, if nothing more suitable can be obtained, dress one corner to suit the shape of the tooth; hold it firmly with one hand against the tooth; be careful to hold it so that the tooth cannot move further than necessary; then strike the tooth with the hammer before spoken of. The metal will stretch on one side and move over easily, and not break if the metal is sound.

"To make the best possible point, the extreme point should be moved over a little too far; then taking the file, hold it flat against the blade and tooth, and at the same time dress lightly and apply the guage. This guage, when properly applied, will give an approximation to correctness; finally, for perfection, range along the teeth with the eye, and correct the imperfections. This, however, will require some practice and experience. Never set more than to give the saw liberty to move without binding. The directions here given apply more particularly to the Tuttle saw than to any other, but will, in the main, apply to any cross-cut saw."

Hatching Fish Eggs.

The experiments in fish breeding are bringing to light some very interesting facts in their natural history. It takes much longer to hatch the eggs of the varieties that breed in cold water, than those that are spawned in rivers during the summer. The eggs of shad put in water of suitable temperature, produce young fish in a few days. The salmon trout eggs require a longer incubation than those of most birds. Salmon require two months or more, under the most favorable circumstances. The New England Fish Commissioners, we see by the papers, are having great luck in the hatching line, at the Charlestown Springs, in New Hampshire, where they deposited 40,000 salmon eggs in October. They hatched on the 11th of December, just 62 days from the time they were taken from the parent fish. The eggs of the salmon trout, at these springs, were 35 days in hatching,

which is said to be the shortest time on record in this country. The salmon eggs were taken from fish in the Miramichi, one of the best salmon rivers in New Brunswick. Our Eastern readers will be very glad to see this evidence of substantial progress in the work of re-stocking New England rivers with fish. It will be recollected that a very large stock of shad eggs was hatched, and turned into the Connecticut, at Hadley Falls, last spring. These, according to the programme, ought to make their appearance in that river the coming season. The annual catch of shad in the Connecticut has dwindled to about 600,000. If 50,000,000 were turned into the river, as reported, shad ought to be very plenty and cheap next spring. For the salmon we shall have to wait longer. They are two years or more in coming to maturity, and it is proposed, we believe, by the Fish Commissioners, not to allow any to be taken from the Connecticut, except for the purpose of propagation, until 1871.

In England, the work of re-stocking the rivers with salmon is going on successfully, and we see frequent discussion in our exchanges on topics connected with this subject. The best method of constructing fish stairs is still under discussion. Nothing better has been elicited than the plan illustrated in our last volume. It is well settled that the inclination in these stairs should not be greater than one foot in seven. These re-stocked rivers are affecting the price of fish and salmon can be had in the London market for less than half what it costs in our cities. Riparian owners are in good spirits, and the papers abound in advertisements of spring salmon fishing to let. We hope to see salmon plenty very soon in this country.

Cheese Factories vs. Butter Supply.

The introduction of cheese factories into the dairy regions is having a very perceptible effect upon the butter market. A much better article of cheese is, no doubt, made than under the old system. It greatly relieves the farmer's wife, and for a time it was more profitable for the farmer. But we apprehend that the new system has been pressed with so much vigor that it is endangering our butter supply. Cheese is now quite too cheap for the farmer's interests, and butter quite too dear for the consumers. It takes from 9 to 10 lbs. of milk, according to the statistics of the Dairywomen's Association, to make one pound of cheese, and about twice as much to make a pound of butter. Allowing that the labor of making each is about the same, the price of butter ought to be about twice the price of cheese, and this used to be about the relative value of the two articles. But now these proportions are changed, and cheese is worth only one-third as much as butter. Our quotations for these articles December 16, 1867, are: State butter 30 to 48 cents, cheese, 8 to 16½ cents. A year ago State butter was 33 to 45, and cheese, 14 to 19 cents. Cheese has fallen in price until it is about the cheapest article of animal food in the market. Butter was quite too dear a year ago, and grew dearer until March, when it was quoted at 40 to 60 cents. It is higher now than it was a year ago, and likely to go still higher. These quotations show the tendency of the markets, and, of course, tendency of the dairy districts. It may be true that we do not make too much cheese. It is quite evident we do not make butter enough. We know of nothing else to affect the relative supply of these articles except the cheese factories, which are now numbered by hundreds, and

absorb the milk of the best farmers in the dairy regions. The supply of milk for the cities and large towns draws alike upon the cheese and butter supply and would not disturb the balance.

What is to be done in this state of the market, to restore the balance and give us butter at reasonable prices? We believe a few of these factories make both butter and cheese, and this, perhaps, will become necessary for all, to get the highest market price for the products of milk. These are butter, cheese, and whey, the last of which is fed to pigs. Under the old system, all farmers who had a convenient market for butter preferred to make that from a part of the milk, and convert the balance into cheese. The skimmed cheese was a second-rate article, but wholesome and nutritious, and entered quite largely into the family supplies. It found a market at the country store and utilized the milk better than exclusive butter making would have done. The exclusive cheese makers were those who had no ready market for butter. The cheese would keep better, and could be disposed of in large or small quantities as suited the convenience of the dairyman. We see no insuperable objection to the making of both butter and cheese by the factory system. Of course, first-rate cheese could not be made at the same time that the butter was made. But we might have first-rate butter with a second-rate article of cheese all through the season, or the season might be divided between them, giving the cooler months to butter and mid-summer to cheese. Some change is called for, and we must have it or go back to the home manufacture. If farmers find they can get 45 cents a pound for butter at their doors and only 15 for cheese at the factory, they will prefer to take care of their milk at home. The factory system has some drawbacks besides low prices. It strips the farm of fertilizers. The skimmed milk fed to pigs with other feed made the best of pork, and the swine made a yard of the best manure. Wherever it went it told a much better story than stable manure, and its effects were visible for many years upon the hay crop. Any system in farming is much to be deprecated that prevents the manufacture of home made fertilizers.

Poultry Manure—How to Save and Use it.

Poultry manure, one of the most valuable fertilizers made upon the farm, is too often allowed to go to waste. The hens and turkeys roost upon trees, under the shed, in the wagon-house, or wherever it happens. To save the manure, these birds must be taught to roost in one place. Turkeys readily take to elevated poles near the house or barn, and these should always be provided for them. Sweep up their droppings every few days, and put in a box or barrel, and keep dry. Hens will roost under cover, and a hen-house should always be one of the farm buildings. The floor, if not of boards in a loft, should be such that it can be cleaned easily and frequently. It is well to keep plaster or dried peat under the fowls. Put the sweepings in old barrels as fast as they accumulate. In a dry state they will keep a long time without much loss. It is customary to mix these droppings with wood ashes, without much attention to definite proportions, at the time of planting, and drop them in the hill for corn and potatoes. If care is taken to keep the seed from contact with the manure, they produce very satisfactory results. But this is not the best way of using it. Two or three weeks before planting, mix the contents of the barrels with about three times

their bulk of moist loam or peat under cover. When the mass is well heated, shovel it over, and mix with it as much more loam or peat, and let it lie until wanted. This may be worked into beds prepared for garden seeds, or dropped, a handful to the hill, for field crops, and will always tell a good story at harvest time.

AN ABOVE GROUND CELLAR.—A correspondent, R. H., at Oshkosh, Wis., writes as follows: "I built a cellar above ground in 1866, but did not protect it sufficiently; the sawdust being wet got frozen, and the frost penetrated to the cellar. This year I banked it up with litter, and put a ventilating pipe through the roof, and it works well so far. The temperature is about even, no matter what the weather may be. It has double floors, packed with sawdust; boards nailed to the studdings inside and out, making a 4-inch dead air chamber; then 10 inches of sawdust; the ceiling is of matched flooring with 8 inches of sawdust above it. I will, in the spring, lath and plaster it, and lay a brick floor. It is 'as handy as a pocket in the shirt.'"

Origin of the Domestic Turkey.

Many suppose, from its name, that the Turkey originated in the East. Not only does the English name give support to this belief, but the French name, *dindon*, a contraction of *Oiseau d'Inde*, (bird of India), shows that the same is held in Europe. Professor S. T. Baird, of the Smithsonian Institution, than whom there can be no better authority, has investigated the subject, and finds that we have two distinct species of turkey in North America: "One confined to the more Eastern and Southern States, the other to the southern Rocky Mountains and adjacent parts of Texas, New Mexico, Colorado, and Arizona; that the latter extends along eastern Mexico, as far south, at least, as Orizaba, and that it is from this Mexican species, and not that from eastern North America that this domestic turkey is derived." One of the points of difference between the two, and the one believed to be constant, is in the color of the tips of the tail-feathers and of the feathers overlying the base of the tail. These are creamy, or yellowish white, in the Mexican, and typical barn-yard birds; while, in the wild turkey of eastern North America, the same parts are of a chestnut brown color. The domestic turkey was introduced into England, in 1541, and some years later, became sufficiently abundant to afford the farmer his Christmas dinner. When the Spaniards conquered Mexico, the turkey was found in a domesticated state, and it probably had been reared as a tame bird for several centuries to that time.

Care of Pigs in Winter.

It is bad for the swine that the city societies to prevent cruelty to animals do not extend their offices into the country. We wonder how store pigs survive the winter treatment they often receive. They are fed at irregular intervals and with unequal supplies in quantity and quality. They have no suitable shelter, and are often confined in muddy pens without any opportunity to keep themselves dry and clean. The pig is a luxurious liver, if you give him a chance, and will keep himself clean and comfortable. No animal will pay better for warm quarters and a plenty of straw. This can usually be had in any quantity and at small cost about the farmer's premises. The sty should have its full share, and as often as it gets worked up fine it should

be thrown out, and be replaced. Then it is exceedingly profitable that the feeding trough be kept under cover. Swine do not enjoy eating in the snow and rain more than other animals. Give them a chance to follow their instincts, and then see just how much they love snow banks and rain storms. Then the feeding should not be simply the refuse of the family, but substantial food at regular intervals, and in quantities adapted to their weight. Store pigs want to be kept in good thriving condition until they are put up for fattening. Money is sunk in trying to make pork out of stunted pigs.

More Cattle Wanted.

With the price of beef at 18 cents by the carcass, and Porter-house steak at 35 cents, it is quite evident that meat eaters in our cities want more cattle, and we think the farmers, both East and West, North and South, want them quite as much. Pork is the only cheap meat in the market, and that is rather owing to a short crop of corn and potatoes than to any surplus stock of swine in the country. The great corn growing States of the West have been visited by a prolonged drought, diminishing that crop from twenty to forty per cent. Farmers having large stocks of hogs are not able to winter them, and are pressing them upon the market in a half fattened condition. This temporarily depresses the price of pork, but nothing occurs to make cheap beef steaks. The war has closed, and many things have fallen to quite reasonable prices. Cotton and wool are depressed, and clothing of these materials is receding toward ante-war prices. The merchant with a large stock of these goods on hand trembles in his shoes with anxiety to be rid of them. He is exceedingly accommodating both as to price and credit. But the butcher wears his white apron as stiffly as ever, and treats one as coolly as the season. There is only so much stock in the market and nobly can undersell him. The cattle trade is, no doubt, very well regulated, and we hear of combination and speculation to regulate prices. This trade is so vast in bulk, and draws its supplies from so wide a territory, that it is hardly in the power of any man or any combination to keep up prices unusually for years as they have been since the war. The men who own cheap lands raise the cattle and sell to the men who graze and fatten them on better lands. These graziers, coming from all parts of the West, sell to the drovers and forwarding merchants in the large Western cities. More of this business is done at the Chicago stock-yards than at any other one point. Thousands of cattle and millions of money change hands in a day. It is an open market business, and the price is regulated by demand and supply as in most other kinds of business. The shortest and best way to reduce the price of beef is to raise more cattle, and this, we believe, will be quite as profitable for the producer as for the consumer.

A mixed husbandry is, unquestionably, the best for the land and its owner in the long run. The raising of cotton and tobacco in the South leaves old fields and deserted mansions everywhere. The soil is recuperated only by expensive manuring or by a long rest in forest. Continual cropping, without returning any thing to the soil, will make any region desolate. The constant wheat and corn growing upon the new lands of the West is steadily reducing their fertility, except on the river bottoms, where the annual overflow restores what is taken away.

[COPYRIGHT SECURED.]

A PAIR OF CASHMERE OR ANGORA GOATS.—*Drawn and Engraved for the American Agriculturist.*

In many of these States the average yield of wheat is already reduced one half, and will sink still lower without a change of policy. We want to sell from all our farms, East and West, more animal products and less vegetable. At the present prices, and with good facilities, it will pay much better to sell beef, mutton, butter, and cheese, rather than hay and grain. As a rule we want to consume the great bulk of the vegetable crops upon the farm for the sake of improving the soil. If there is a good system of saving manures, the farmer can keep his hay and grain at home. He can raise fine stock to sell, horses, working cattle, sheep, hives, butter and cheese, for these and other animal products imply an increase in the stock of fertilizers and better field crops in the future. Some regions, favorably situated for liming the land and getting cheap manures, can afford to sell wheat, but these are exceptional cases. Selling grain, as a rule, is only selling one's farm by installments. The land is all the while growing poorer, and unless there are adventitious circumstances to give it value, its market price is diminishing. Land that will produce thirty-five bushels of wheat to the acre is worth probably a hundred dollars an acre or more. Land that yields but ten would be dear at a quarter the price. Many a grain-selling farmer wakes up at last to find that his farm has slid away from beneath his feet. Give us, then, more cattle, and make more fertilizers. Farmers will have to wait a little longer for the dividends, but they will run no risk of using up their capital and destroying their business.

Cashmere or Angora Goats.

The Cashmere Goat is a variety of the common goat, which, like the sheep, and, in fact, all our domestic animals, exists in an almost infinite number of varieties. This, with other closely allied breeds, has been raised from time immemorial, chiefly for its beautiful fleeces. The hair being glossy and fine, it is used in weaving many delicate and beautiful fabrics, and in other ways. Importations of goats from Asia Minor have been made from time to time, with a view of testing their hardiness and value in this country. Their endurance of heat, cold, dry pastures, etc., and if the fleece would remain of the same length and fineness, were important questions to be solved, and these, we think, have received very satisfactory solutions. No doubt, the animal is very hardy, and the fleece remains fine and excellent. These Cashmere Goats feed upon the same food that other goats eat, almost all sorts of weeds included. They are also, be it remembered, equally destructive to trees, and valuable plants, and shrubbery, and will not do well if closely confined. They must have range.

The above picture is made up from sketches, taken by our artist upon the fair grounds, and from a photograph. It does not represent the ideal goat, but the animal as he is. The picture would fill the breeder's eye much better if the back were straighter, and the tail set up upon a level with the top of it, but we are content with the accuracy of the photograph in this respect.

A gentleman largely interested in this stock estimates the number of full blooded, or nearly

full blooded, Cashmere Goats in this country at present at about 10,000. This is, we think, entirely within bounds. Besides this number, there are grades, (half three quarter, and seven eighth bloods,) almost without number, many of them having very fine fleeces, scattered all about. Extravagant ideas have been entertained in regard to the value of the fleece. It has been thought to be worth \$3 to \$6 per pound, and as nobody was found to give this, the fleeces have been stored, and most likely become food for moths. There never has been enough of this article in market to fix a price. There are a few small factories where it is spun and woven, and the proprietors of these trust to chance lots they can buy at low prices. A fair price is probably \$1.50 per pound, taking the fleeces as they run.

We have little doubt that, with the revival of business, there will be a market for this wool, and that new and interesting manufactures will spring up. As it is, however, there is no demand, and hence no sale for it. The goats, on the contrary, are in great demand; 150 recently imported by Mr. Israel Diehl for Mr. C. S. Brown, of this city, are held at \$300 a pair, and we hear of both higher and lower prices.

The length of the wool of full-blooded bucks varies with the age, but at three years of age, it often reaches the length of 10 or 12 inches. The fleece of the ewes is much finer and more glossy, as a rule, and the finer and closer the fleece, the less length has the staple. The waves in the locks, which are obvious in the engraving, and give to it its great beauty and brilliancy, are three quarters of an inch to one inch apart.

MAURANDIA BARCLAYANA.

Two Useful Climbers.

Last summer it became necessary to provide some kind of a screen for two long windows which came down to a veranda. Rapidly growing plants were desirable, as well as those having beauty of leaf and foliage. Small galvanized wire was run from one pillar of the veranda to another, to form a support, and several plants of *Maurandia* and *Lophospermum* were set out. The wires were soon covered with a screen of foliage sufficiently dense for the purpose, and a constant show of flowers was kept up until hard frosts destroyed the vines. We were so much pleased with the result that we had drawings of the flowers made last summer, and present them above. The *Maurandia* is the more delicate of the two, and has very pretty leaves of a pleasing light green and of a somewhat triangular shape. The commonest species is *Maurandia Barclayana*, a native of Mexico, and presents several varieties, which range in color from white and lilac to purple.

Lophospermum (*L. erubescens*) is a much more robust grower, with larger stems, leaves, and flowers. Both the stem and leaves are clothed with an abundance of fine sticky hairs, which give the plant a pleasing velvety appearance. Both this and the *Maurandia* climb by twisting their leaf stalks around the wire, or other support, which they clasp with a remarkable degree of firmness. The calyx is conspicuous both before the flowers open and after they have fallen. The shape of the flowers is given in the engraving; they are downy and of a pleasing rose color. The name *Lophospermum* means crested seed, while *Maurandia* is given in honor of a professor of botany named Maurandy; neither has any common name. Both of these climbers may be readily raised

from seed, but unless they are started under glass early in the spring they will be rather late in coming into flower. As they propagate readily by cuttings, they are kept by florists, and it is much better to obtain established plants. In the case above referred to the plants were set out in the border, but they may be grown to decorate balconies, taking care to give them plenty of pot room, or in window boxes. Several other climbers are useful for covering screens and balconies, but the above have a delicate and refined appearance that is particularly pleasing. Some of the newer *Tropaeolums* or *Nasturtians* are brilliant and showy, and are easily raised from seeds, though plants raised from cuttings may be bad at the

florists. The beautiful Canary-bird climber, also a *Tropaeolum*, so beautiful in foliage and curious in flower, and so easily grown, is a plant that cannot be too strongly commended.

Cherries—Culture and Varieties.

BY F. R. ELLIOTT, CLEVELAND, OHIO.

[Mr. Elliott has given particular attention to the cherry, and has long been regarded as our best authority on the subject. In view of the general neglect into which this fruit has of late years fallen, we requested Mr. E. to prepare an article for the Horticultural Annual. The manuscript came too late to insure its insertion in the Annual, and thinking it too valuable to go unpublished, we present it here.—EDS.]

From the large number of varieties of cherries that rank as best, it is a task difficult of performance to select a dozen that shall combine all the good qualities and be void of the bad. Nevertheless, having given the cherry my careful attention for many years, I will venture to make a selection, which I feel can be planted and the growth and fruit prove perfectly satisfactory, and although it may not combine, or rather embrace, all the good, I feel assured it will have less of the bad than any other list of the same number of sorts that can be made. Prefatory to the description of my list, let me say the cherry tree will not bear "wet feet,"—in other words, the position where it stands must be well drained, so that at no time will the water remain stagnant in the soil about the roots. Gravelly and sandy soils require little or no artificial drainage, and the cherry seems especially at home when planted in gravelly loam; but let no one, because his land is clay, be deterred from planting the cherry, for I have

LOPHOSPERMUM ERUBESCENS.

found it repeatedly doing equally well in a clay loam, when due attention has been paid to surface drainage. In the rich prairie soils, surface drainage is often quite as requisite as in soils of a heavier and more clayey nature. The finely comminuted soil of the prairie seems to hold water in its pores, even when well underdrained, to such an extent as to create disease in the roots of all soft-rooted trees, producing an unhealthy, although perhaps rapid, growth, that results in death from climatic influence, either of summer or winter. In gravelly soils the growth of the cherry is quite moderate, and in strong clay soils, with good surface drainage, the growth is about the same; it completely ripens its wood and root and withstands extremes of temperature as well as the apple.

In procuring trees for planting, my advice is to get those only one year old from the bud, and see to it that they form their branches for the permanent head at not more than two feet from the ground. This low form will make them more capable of withstanding severe winds, and the foliage will shade the bodies from the effects of hot suns in summer. With these few remarks I will commence my enumeration and condensed description of my twelve sorts, taking the *sweet* cherries first, and as nearly as possible in their order of ripening.

EARLY PURPLE GUIGNE.—The trees of this variety are poor growers in the nursery, and to make good orchard trees they should always be headed back while young. As orchard trees they are among the most hardy of all this class, producing abundantly, when they once acquire mature age—say ten or twelve years. A fruit of medium size, purplish-black, and of sweet, rich flesh. As a market variety, its earliness makes it one of the most valuable.

ROCKFORD.—The tree of this variety is very

upright and handsome in growth, making a compact and elegant form, and producing abundantly a fruit of the largest size and very best quality, making it of the greatest value either for market or private use. The color of the fruit is clear bright red, shaded and mottled on amber yellow; juicy, sweet, and rich.

COE'S TRANSPARENT.—This variety makes a tree of only medium size, rather spreading in form, of moderately rapid growth, resulting in hardness. It comes early to maturity, and produces abundantly a medium-sized fruit of a light amber-yellow color, mottled over with a bright clear red, very beautiful; the flesh is juicy, sweet, exceedingly rich and delicate, making it especially valuable for the table.

GOVERNOR WOOD.—This variety has, perhaps, had as wide-spread and as good a reputation as any cherry in the list of varieties, and when the tree is not overladen with fruit, it deserves all that has been said. It has, however, the fault some seasons of bearing more fruit than it can mature perfectly, except it be supplied with manure, as soapsuds, etc., while the fruit is growing. For a market variety it, like Coe's Transparent, is not fitted, as it is too tender for carriage any long distance; but for private gardens it cannot well be dispensed with, on account of its great delicacy and richness. Its fruit is of large size, light yellow, mottled or marbled over with carmine-red; flesh, half tender, juicy, sweet.

PONTIAC.—Among all the black cherries this, taken all in all, has no superior. The tree is a good grower, richly, productive, and the fruit large, firm, juicy, and sweet. In real richness of flavor it is not, perhaps, equal to Black Hawk, but the tree is so much superior in growth and productiveness as to make it much the more desirable. Superior as a market sort.

RED JACKET.—Had we not this variety we should put Downer's Late in its place, but when Red Jacket can be obtained, its great superiority in size and quality of fruit, coming at the same period, renders it more desirable, whether for market or table use. The trees are fine growers, becoming very large, spreading, upright, very productive of a large-sized fruit, which is amber-yellow, overspread with pale red; flesh half tender, juicy, and good.

Having thus named and remarked upon six of what are termed sweet cherries, I now come to a class that may be grown almost everywhere, in all soils and climates where the apple will succeed. These are generally classed as *sour* cherries, although, with one or two exceptions, they are not sour, but just pleasantly acid. The perfect hardness of the trees makes them the most desirable, if but six varieties are to be grown. In naming and describing them I will take them more in the order of their value, in my opinion, than of their time of ripening.

LOUIS PHILIPPE.—This is a variety from France, and I think I was among the first to import it. The tree is upright, spreading in habit, growing to a large tree as it acquires age, open and regular in form, a vigorous, good grower, very productive of a large, roundish, dark red fruit, which has a tender, juicy flesh, and is of a mild acid. Valuable either for the table, for market, or canning.

EARLY RICHMOND.—Although some persons consider this identical with the Early May, I do not; I think the tree more drooping in habit. It is certainly a valuable sort, becoming fit to gather early for cooking purposes, but not really ripening until quite late. The flesh is reddish,

and the stone adheres strongly to the stem.

ARCHDUKE.—This, perhaps, should come next to Louis Philippe, and I place it third in the list only because of the cooking qualities of the Early Richmond. As a variety for table purposes this is superior, but for market the last named would be preferable. This is the best among the Duke varieties. Tree, very erect and upright in habit, quite hardy; an abundant bearer, ripening early in July a large, dark, shining red fruit, with light red flesh, which adheres slightly to the stone, tender, sub-acid, and rich.

REINE HORTENSE.—This is also a Duke in habit of tree, not as upright as the Archduke; hardy, a moderate, regular bearer of large, roundish, compressed fruit; color of a lively red, marbled on amber-yellow; flesh, a pinkish-yellow, of a sprightly mild acid; ripens quite late in July.

BELLE MAGNETIQUE.—This again has much of the habit in tree of the Dukes, and while young the trees are poor bearers and not more than moderately prolific. As they grow older, however, their productive habit is increased, and fruit may be gathered from them for many weeks in succession. The fruit is large, yellow, mostly covered with red, and with a yellowish-red, tender, mild acid flesh.

EARLY MAY.—This variety, now generally cultivated in Illinois and other Western States, where many other sorts of more excellence have failed, I am disposed to regard as identical with Donna Maria of the French. It is very prolific of fruit, quite hardy in tree, more upright in growth than Early Richmond, or rather with not the same drooping, slender spray. Fruit, medium size, dark red, tender, juicy, rich, acid; good for cooking and market.

SEEDLINGS.—During the past season I examined the fruit of quite a number of seedlings grown by Mr. Charles Pease, near Cleveland, and among them selected the two described herewith as giving promise of value. Mr. Pease has designated them by letters of the alphabet, but will not attempt to propagate until another season of fruiting has passed, when, if they continue as good as this season, they will be named.

PEASE'S A.—Size, medium; yellow, mottled over with red; surface, smooth, even, regular, heart-shaped; fruit borne usually a single cherry in a place, rarely in pairs; stem, slender, set in a regular, even, round cavity of moderate depth; flesh, yellow, half tender, juicy, rich, and sweet; pit, small; leaf, long, acute, pointed, with sharp, irregular serratures; petiole, with two globose glands. Tree of growth like a Mazzard, large and strong. Ripe, July 15, '67.

PEASE'S B.—Fruit, medium, long, compressed, heart-shaped, firm as any Bigarreau; dark rich red on yellow ground, a little marbled and dotted; stem, slender, set in a deep, regular cavity; flesh, yellow, firm, hard, juicy, and rich; pit, small. A very valuable, late, market sort, neither this nor the preceding having rotted. Ripe, July 16, 1867. Leaf, with reddish petioles and two globose glands, broad oval-obovate, pointed, with sharp serratures. Fruit, singly and in pairs. A strong, vigorous, upright grower.

THE MINER PLUM.—Some time ago we stated that this was an improved wild plum, an opinion founded upon specimens of the fruit and leaves kindly sent by friends at the West. Several, some of them interested in its sale, and some not, write that this is a mistake, and that the Miner is a seedling of the European plum. As the two are so different, we cannot believe

this without direct and positive testimony. A letter from "W. W." Grant Co., Wis., says: "I have raised the Miner plum for five or six years; I got it from Mr. Miner, in Grant Co., Wis., who bought his trees of a man in Illinois, who did not have any name for them, so they were called the Miner plum. The true name is Chickasaw plum. A Mr. Isabell, of Joe Davis Co., Ill., has raised the same plum for more than twenty years. It ripens in October, is of a red color, is fleshy or hard for a wild plum, and resists the curculio. I consider it desirable on account of the lateness of its ripening, but I have wild plums that I think just as good."

A Chestnut Grafted upon an Oak.

The Revue Horticole for Dec. 16th gives an account of an instance of grafting of a chestnut upon an oak that would seem incredible were it not so well authenticated. The seeds of the European White Oak, (*Quercus pedunculata*) were sown in place, and when the young oaks were four years old two of them were cut off at about 15 inches from the ground, and grafted with chestnut by the ordinary cleft method, and three others were budded the same year with chestnut. The budded ones failed, but the grafted ones succeeded; one of these was broken off by the winds, but the other grew, and now stands in the botanical garden of Dijon, being over 30 years old. The chestnut at first outgrew the stock very rapidly, and made an enlargement at the point of union; this tendency was in good part overcome by making longitudinal incisions in the enlargement and the stock. The stock each year gives proof of its identity by throwing up a number of oak sprouts. The fruit does not perfect itself, though it sets abundantly; this is attributed to the use of a graft from an unproductive tree, rather than to any unfavorable influence of the stock. A detailed account of this very remarkable instance of grafting is published by J. B. Weber, head gardener to the botanical garden of Dijon.

The Grape Vine—How it Grows and What to Do with it.—1st Article.

From time to time there have been given in these pages, articles upon different methods of pruning and training the vine. In view of the increasing interest in grape culture, on both the large and small scale, we believe we shall do our readers good service, and we know that we shall meet the expressed wishes of many of them, if we present the different systems of training in a series of connected articles. We do not do this with a view of superseding the many excellent treatises that there are upon the vine, but with the hope to meet the wants of the great number who do not care to make a special study of the subject, and who look to the *Agriculturist* to supply all needed information upon this, as upon all other, rural matters. It is easy enough to lay down rules for pruning, and to make figures to illustrate just where to cut; if grape vines always grew just alike, and were turned out to pattern, there would be no difficulty. But the trouble is that the vine is a living thing; it may be weak, or vigorous, it may grow like the picture in the book, or it may forget to make buds just where the engraving shows it ought to have them, and then the routine operator is at fault. A successful grape grower once told us that his advice to a novice was to "buy a work on grape culture, and then go exactly opposite to its teachings."

While we cannot agree with this, we accept it in so far as it is a protest against working by a set rule and an injunction to use judgment in the treatment of the vine. We should think him a very poor surgeon who should always amputate an arm or leg in the same place. As a knowledge of anatomy is the basis of all successful surgery, so an understanding

of the greatest importance, and we give (fig. 1) Dr. Mohr's figure of it as it appears in summer. The node is the place at which the young shoot breaks with great ease when green, but as it ripens a stronger union is formed between the parts, and the stem no longer breaks readily at that place. From the node springs a leaf, which is united to it by a joint, and from which it spontaneously separates when ripe. At the place where the leaf and stem join, and upon the upper side of the leaf stalk, are two buds. One of these buds grows the same season it is formed; the other (unless in cases of accident) remains dormant until the following season. On the side of the stem opposite to the leaf is a tendril, (or cluster of grapes, instead) which does not (like the leaf) drop off spontaneously. These parts alternate upon the stem. In the figure the leaf is on the left hand, and the tendril, (shown here with grapes), on the right; on the node above, the leaf will be upon the right and the tendril on the left, and so on throughout the

Fig. 1.—THE NODE.

of its structure is the foundation of all proper treatment of the vine. The parts of the vine and its manner of growth being once understood, all systems of pruning and training become plain, and difficulties that present themselves in all of them, are readily surmounted. Perhaps no one has given us the anatomy of the vine so clearly as is done by Dr. Mohr in his admirable little work, "The Grape Vine," translated by Hortícola. For our purpose we cannot do better than present his figures and condense his account of it. If we look at the stem of a vine, whether it is growing in summer, or now, while it is bare of leaves, it is plain to see that it is made up of a succession of joints, a leaf, or place where a leaf has been, a space of

whole length of the branch. Here there are all the parts (save the root) that are to be taken into account,—the branch, (or stem), the node, the leaf, the bud, and the tendril. The tendril is to be regarded as a barren cluster, for we always find the cluster occupying the place of the tendril, and not rarely one that is part tendril and part cluster, bearing grapes. The vine, as long as it continues to grow, keeps on repeating these parts, as seen in figure 2, and a full study of these will prepare the novice for the next steps—the appearance of the branch in autumn and the growth the following spring.

Raising Box from Cuttings.

The advice has usually been given to set none but rooted plants in making a box edging, for the reason that we have seen such unsightly failures from cuttings made and set in the usual way. Our friend, "Phil. Woodley, Esq.," of N. C., sends us his plan, which we give below. His success may be due to his manner of making and setting the cuttings, though his more genial climate may have something to do with it. Box is still the favorite edging where it will stand the winter, though we should not advise allowing plants in an edging to grow to the size that "Esq. Woodley" indicates.

"The first step is to lay off the yard in some plain, but pleasing manner. After having thus laid off the walks, (which may be done with old shingles, pieces of laths, or anything of the kind, moving them until you have the line exactly as desired) then prepare them for a suitable edging. Nothing answers this purpose, we think, half as well as our common dwarf box. It may be raised to any extent in the following way: Trench your line six or eight inches deep—twelve is better—and four or five inches wide; then fill up with rich, light compost, composed of wood mould, a small quantity of ashes, and rakings from any rich spot about the yard, and pack the same hard to its very top. The feet are the best packer that can be used. All is now ready for the box. Cuttings can be procured from any large shrub

of the kind within reach, making them about six inches long, and leaving only about one inch of leaves on the whole piece, and that at the very top. Now make a *dibble* of any stick or piece of wood convenient, but round at the top, to secure the palm of the hand from injury, and you are ready to commence the edging. Plant the cuttings as you go—say twelve inches apart—first making the holes with the dibble, and then pressing the dirt firmly around each cutting, from bottom to top, and leaving but the inch of leaves on the top above the surface. I should have said that, after laying off the line for the edging with old shingles or laths, (which may be put as thickly as desired), and the course of the future border is fully determined on, the most of the sticks may be taken up for convenience in trenching, the few remaining only determining the general direction, and before making the holes for planting the cuttings, a slight mark ought to be made on the packed compost, corresponding exactly to the line before marked by the sticks. This will insure regularity, and the line should be marked and re-marked until it is exactly as desired, for no future trimming can supply the deficiency.

This is my plan of making an edging, and so well has it answered that out of about 2,000 cuttings set in my yard, I lost *twelve*. They have had no attention save keeping them clear of weeds, and an occasional trimming. They have grown so handsomely under this treatment that it is now necessary to take up every other one, that those remaining may have ample room to "spread" themselves, thus giving me another supply for my own use and that of my friends."

PLANT LICE AGAIN.—We gave last month Mr. Rivers' preparation to destroy plant lice, or aphides, and we now give another, in order to keep our readers informed of everything that offers a prospect of relief from these pests. As soon as the young shoots push on the fruit trees, they are, in many localities, covered with these minute, but multitudinous, insects, each busily engaged in sucking the juices from the tender wood and checking its proper development. A correspondent in the London Journal of Horticulture gives the following: 1 ounce of aloes, 2 ounces of soft soap, and 1 ounce of sulphur, in a gallon of water. The preparation is said to be efficient, and if the common Cape aloes is used, it can be made sufficiently cheaply to allow it to be freely used. Dwarf trees in the garden are attended to without much difficulty, but for larger trees the task becomes one of considerable magnitude. Still, with Page's Sprinkler, or some similar implement, all parts of a moderate sized tree can be reached. The insects multiply rapidly, and are most successfully attacked when they first make their appearance. The same writer says that this preparation is destructive to thrips. If it will keep off our thrips, so injurious to the grape vine, it will be valuable.

Fig. 2.—SHOOT OF THE VINE.

vine for a few inches that does not bear anything, another leaf, and so on, the whole stem being a repetition of this. The point to which the leaf is attached is called the *node*, and the space between the nodes is an *internode*, a term not much used in speaking of the vine. The *node* is a point, the understanding of which is

THE PEAR SCALE.—The (English) Journal of Horticulture has recently given a remedy for the pear scale, which we give as we find it. It is simply to paint over the affected trees with boiled linseed oil, in early spring, just before the buds expand, and consequently just before the scale insect begins to multiply. Where the scale is very bad the trees may as well die of the remedy as of the disease.—Now, mind that we do not endorse or recommend this treatment, but if any one has a scaly pear tree, he can try anything that offers a prospect of cure.

FIG. 1.—FLOWER OF SPICE-BUSH.

The Spice-bush—*Lindera Benzoin*.

These wintry days will soon be over, and the lover of native plants will be on the lookout for the first indications of returning spring. If he takes a tramp in the woods he will find that the buds of the Spice-bush are among the earliest things to show signs of life, and that when winter is fairly over, often as early as March, the impatient, swollen buds can contain the secret no longer, but burst their envelopes and cover the straggling bush with pale yellow flowers, which, later, would appear quite inconspicuous, but coming so early they seem really gay. The Spice-bush is rather common in damp woods from New England to the Gulf of Mexico; it forms a shrub of five to ten feet high, with long and rather weak branches. The flowers are small, in little clusters, and both sterile and fertile ones are borne on the same bush. Fig. 1 shows a twig as it appears in flower, which is before the leaves expand, and figure 2 gives the leaves and the berries all of the natural size. The structure of the flower is interesting to the botanist, but is not easy to explain to the general reader. It is sufficient to say that there is no corolla, but what appears like one is a colored calyx, and that there are several rows of curiously shaped stamens. The berries are red and shining. All parts of the plant have a strong aromatic odor which is to some persons disagreeable; the shrub is closely related to *Sassafras*, and, like that, has been used as an aromatic stimulant, and from its having been employed medicinally is in some parts of the country known by the name of Peter-bush.

This shrub has had a hard time with its botanical name; it was first called *Laurus Ben-*

zoin, it being considered by Linnaeus as a Laurel, and the specific name, *Benzoin*, was given from a resemblance of its odor to that of the aromatic drug Benzoin. It being found not to be a *Laurus*, Nees made a new genus and took the old specific name *Benzoin* for it, and for a long time the shrub went under the name of *Benzoin odoriferum*. Nees had overlooked the fact that Thunberg had many years before made a new genus for it, and called it after a Swedish botanist, Linder, *Lindera*, a name which, according to botanical rules, we are obliged to adopt and call the shrub *Lindera Benzoin*. We call attention to this shrub as one of the natives of our woods that has been almost overlooked by cultivators. Though it naturally prefers a damp and shaded locality, it does perfectly well when transferred to drier and open grounds. Its natural habit, though not without grace, is rather too loose and straggling for the lawn or shrubbery, but it bears severe cutting kindly, and may be pruned into a compact shape. It certainly has good claims to a place among ornamental shrubs, not only on account of its early flowering, but for the beauty of its foliage and brilliancy of its berries. The shrub, if removed in spring, should be taken up very early; it is very readily recognized

by its brownish yellow buds, and if there is any doubt about its identity, the aromatic taste of the twigs, which is unlike that of any other of our native shrubs, will aid in determining it.

Apple Stocks from Cuttings.

The failure of some varieties of fruit, of the apple especially, to do well in certain localities or in particular orchards, is not to be accounted for by any unsuitableness of soil or aspect, nor can the insects and fungi, which often do so much mischief, be held responsible for the trouble. There is one thing that is generally overlooked, but which, we think, has great influence in the matter—that is, uncongeniality of the stock. As far as the stock goes, the propagator is working in the dark. Seeds are sown, plants grow, and all that the nurseryman knows about them is that some are vigorous and good stocks, and others are poor, and to be rejected. The stocks are all seedlings, and even if it were known from what variety of apple or pear they came, it would not help the matter, as they might or might not inherit the habit of growth of their parents. We know that certain varieties are freer growing, are more hardy, and have other qualities that make them to be preferred as stocks over other sorts that are of a different character. In grafting a known sort of fruit into a seedling stock, we have to run the risk of the two being suited to each other. There is no immediate change to be looked for in the manner of propagating trees on the large scale, but there is one direction in which experimenters should turn their attention, and that is to find some suitable stock which can be freely grown from cuttings. The Paradise stock, used for dwarf apples, is readily propagated by stool

FIG. 2.—FRUIT AND LEAVES OF SPICE-BUSH.

layers, and there are in Europe several varieties of apple which make good stocks without dwarfing the trees, that grow readily from cuttings. Rivers gives an account of the Burr Knot Apple, a good kitchen fruit, and which grows from stout two and three year old shoots stuck in the ground. Several kinds of the Burr Knot are known, one of which is called "Hyde's Walking-stick Apple," because an old gentleman by the name of Hyde used to stick a branch of it where an apple tree was wanted. Among our hundreds of varieties of apples there may be some that will root from cuttings, with sufficient readiness to form stocks, and though this method of propagation is likely to be too expensive and troublesome for the commercial grower, it would be a great advantage to the private propagator, as he would always be sure of having a stock of a known character.

THE JERUSALEM ARTICHOKE.—The Jerusalem Artichoke is the tuber of a perennial sunflower, and not the Artichoke proper, which is the flower-head of a thistle-like plant. The Jerusalem Artichoke has received very little attention as a cultivated plant, and is mainly to be found in old gardens, where it is suffered to exist, rather than encouraged to grow. Mr. J. Rohe, Mt. Lebanon, N. Y., says: "Dig the tubers early in the spring, and cook them just as you would vegetable oysters, than which I consider them much better. They grow sweeter by re-cooking and make a very good dish. Feed to cows, raw or boiled, I look upon them as very valuable, and they are quite prolific and of the easiest culture." Much has been said in foreign journals, within a few years, of the agricultural value of this plant, and reliable information as to its productiveness is much needed.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Do you keep a Household Journal?

A correspondent speaks of the keeping of a journal of family events as one of the pleasures of life. Of the utility of such a practice we have no doubt. It would probably be irksome to many at first, but would soon come to be a pleasant part of the daily routine. The pocket diaries published so cheaply in all our large cities have space enough to enter every thing that would be desirable. If one of these, furnished with a good pencil, were kept in the work-basket beside the needle case and the scissors, it would take but a few moments each day to make a record of passing events. One of the items appropriately kept in such a journal should be the family expenses, and there is usually a place at the end of these diaries where such an account can be arranged in an orderly manner, and footed up each month. The family expenses might be arranged under the heads of table, wardrobe, fuel, lights, service, education, travel, etc., and at the end of each month the heads of the family could tell very nearly whether they had spent more than they had earned. The whole secret of thrift in the household depends upon spending less than the income. Multitudes take no particular pains to ascertain either their income or expenses. They never know whether they are getting on or falling behind. They are never ready to settle accounts, and they live upon credit until nobody will trust them. It is true there are some difficulties in the way of a farmer keeping such an account, that would not embarrass a day laborer or a salaried man. These receive so much in wages or salary and know definitely how much they have to spend every day or every week. But the farmer provides very largely for his own wants, owns his house, perhaps, supplies his own fuel, and, in large part, his table. But it would not take long to ascertain how much wheat, corn, rye, potatoes, poultry, etc., of his own production, are consumed in the family, and what their market value is. If the estimate were made it would enable him to tell very nearly the expense of his housekeeping each month, and at the close of the year, when the account of crops was taken, he could tell very nearly what his income was. This definite knowledge would operate favorably upon a farmer's fortunes in many ways. He could check extravagance if he found it. He could retrench expenses if he found he was living beyond his income. He could get the new carriage or harness, or the piano for Kate, if the state of his finances justified it, without any uncomfortable apprehensions. If a man is not clear-headed enough to keep accounts and live within his income, his wife should take hold and help him in his book-keeping. The temporal prosperity of the family depends upon correct figures.

Other items should find a place under their appropriate dates,—births, deaths, and marriages in the circle of near relatives and friends, the beginning of the school, remarkable extremes in the weather, political, social, and ecclesiastical events, the blossoming of fruit trees, and the first appearance of birds in the spring, the time of sowing or planting the principal crops, the several plantings in the garden, and every thing likely to be of interest in future years. Such a record, faithfully kept, would introduce system into the whole household. It would lead to definite knowledge of many things that now pass unobserved. It would cultivate the habit of observation, which is worth quite as much upon the farm as in any other calling. It is often a matter of very great importance to know just when an event happened, when a tree was planted, when it bore its first fruit, the date of a cold snap, and the record of the thermometer. Legal decisions involving large sums frequently depend upon the memory of such small events. Recording them in a journal preserves an accurate knowledge of them, and is valuable for reference in future years.

Not the least inducement to keep such a journal is its value as an heir-loom to the children, ever in-

creasing in interest as it goes down to the coming generations. What would we give for such a record of the incidents in the daily life of our early ancestors in this country! It would afford a very good outline of their domestic life and of their characters. It would be better than their portraits, for it would show us their surroundings, their style of living, and much of the men and women themselves. The bold doctrine of Sartor Resartus that clothing makes the man may not be true. If we could add to the work of the tailor, that of the schoolmaster and the pastor, the grocer and the butcher, and all the men with whom they had daily intercourse, we should see our forefathers very much as they were. Keep a household journal.

FRAME OF PINE TWIGS.

Household Ornaments.

It is often a convenience to be able to hang a photograph or small picture by the writing desk or the toilet table, to be always in sight. The illustration shows a rustic frame of suitable size for cartes de visite. It is made of the smallest twigs of the common Norway Spruce, about $\frac{1}{2}$ of an inch in diameter. The twigs may be cut at any time when it is convenient, and after lying a few days the leaves will drop off. The natural color is pleasing to the eye, and nothing needs to be done to prepare them for the frame. Cut the side pieces of suitable length, with cross pieces for top and bottom. These are to be fastened at the joints with pins. The additional pieces above and below are fastened at the crossing with needle and thread, and the picture is kept in its place by a stitch at each corner. These can be made very readily by the boys and girls with a little showing, and a great variety of tasteful patterns may be wrought with the small twigs. If stouter limbs, a half inch or more in diameter, are taken, the frames can be made much larger and of a more substantial character. If stout enough they can be fastened with glue, and they will last many years. Skillfully made, they are nice presents for friends, especially when they inclose the donor's likeness. They are frequently manufactured for fairs, and bring very handsome returns for the labor invested in them. They cultivate the taste and ingenuity of the young, and are especially valuable for this reason.

Skating for Girls.

An anxious mother wishes to know if this is a proper amusement for girls. We can see no reasonable objection to it on the score of health or morals. We have known occasional instances of injury to the health from indulgence in this amusement, but it was clearly traceable to unsuitable clothing, and imprudent exposure after the exercise. The same causes would have been quite as damaging to the health of boys. It is a very common error to suppose that girls need clothing less substantial than their brothers, because they usu-

ally spend much less of their time in the open air. This is rather an argument for warmer clothing, that they may feel the change less, and be guarded against taking cold. Too thin clothing for girls is a radical vice in our household economy. A great outcry against thin shoes was made a few years ago, and the fashion was changed very much for the better. But this was only a single item in which reform was demanded. The girl is quite as sensitive to cold as her brother, and demands as much clothing from head to foot. The want of it accounts for much of the neuralgia, the rheumatism, and diseases of the throat and lungs, that afflict our American women. The English set us an admirable example in this respect. With a climate much less severe than ours in winter, they dress much warmer, and their women are trained from girlhood to out-door pursuits and amusements. They grow up with robust constitutions, well acquainted with the mysteries of the field and the garden, of the barn and stock-yard, as much accustomed to riding and walking, and as capable of enduring fatigue as man. Their shoes may be a little clumsy, and their complexion not so delicate, but they have what is better than any external grace, sound bodies, and that good common sense which comes of practical acquaintance with out-door life. Their refinement is not measured by dress and complexion.

We have welcomed the present fashion of skating because it took our girls more into the open air, and enabled them to share the amusements of the other sex. It is not necessarily too severe, it strengthens the muscles, and accustoms the body to graceful movements. For aught we can see, the girls take to it as kindly as the boys, and it is quite as helpful in their physical training. Of course this amusement, like any other, needs regulation, and must have its appropriate times and places. It may become a mania and interfere with more important matters. It may lead to midnight excursions and bad company. There is no place of absolute safety, either in work or play, for the young. They need amusements quite as much as work, and kindly oversight and guidance in both.

Economy in Food.

With a bountiful harvest in most parts of our country, there is a want of prosperity, and the need of a more rigid economy than most families are accustomed to practice. In the South much suffering is reported, though the corn and wheat crops were abundant. In the North trade is dull and many failures have already taken place. Manufacturers are reducing their labor, and many are thrown out of employment. In the cities and towns mechanics and laborers are not fully occupied, and they have to live on smaller incomes. All classes suffer in this general depression and must study economy. This virtue was practiced from stern necessity by former generations, but in our own time the tendency is all toward luxury and extravagance. The young begin where their fathers left off, and without much thought of the consequences, spend as freely as if they had the income of their fathers. There is great waste at the table especially. Much of the food is spoiled in cooking, much is left upon the plate to be thrown away, and hardly a thought is bestowed upon the amount of nourishment furnished by the different varieties of food offered in the market. Many will now have to study the problem of nourishment in the cheaper forms; and the experience of smaller incomes, if rightly improved, will be profitable. An average German or French family will live on half the income of an American, and keep in good physical condition. It is not necessary to good health to buy Porter-house steak, or the dearest cuts of lamb and mutton. A soup prepared from meat costing one-fourth as much will appease hunger, and will go quite as far in sustaining the laboring man, though it may not please the appetite quite as well. As a rule, we eat much more meat than Europeans, more than is good for our best physical development and sustenance. A bushel of corn has about the same alimentary value as a

bushel of wheat, while it costs but half as much; yet upon the tables of many persons of small incomes, corn never makes its appearance. Properly cooked it makes excellent bread, and in the hands of the skillful housewife, it is wrought into a great variety of appetizing articles. It is attractive as hasty pudding, hominy, samp, and hulled corn. In the whole tribe of Johnny cakes and Indian puddings, it is glorious, as every one knows who has tested the many recipes that we have published in our back volumes. Then, in farmers' families, there is often a great dearth of vegetables. The potato and turnip are universal, but the cauliflower, the more delicate kinds of cabbage, the beet, carrot, parsnip, horseradish, and celery, that might be on the table all through the winter, are quite frequently wanting. In summer the kitchen garden is quite too much neglected, and the citizen fares much better than the farmer, who might have all the vegetables at small cost at his own door. A good garden will half support a family, and the man who owns a small piece of land near his home can get wholesome food cheaper from this source than from any other. In the economy which must needs be practiced henceforth, determine to make the most of this source of supply. More fruits and vegetables of your own raising, and less meat, will be a sound maxim in the household economy. And while upon this topic we must not overlook the dish of baked beans, which was the main stay in New England families in the early days, and which still makes its regular appearance with Sunday morning in many Yankee homes. It is said that this esculent furnishes more nourishment for the price than anything else in the market. This is probably so. We know it to be savory and cheap in all the forms in which it comes to our table. It is an indispensable item in compounding succotash, a dish that is welcome once a week the year round, and is nearly as good in winter as in summer. It makes excellent soup. As porridge, it is said to be best nine days old. It usually disappears on the first day, and we cannot speak for a greater age. The Lima bean, gathered fully ripe, or when the pod is green, and dried, is an excellent vegetable served with all meats, and ought to be as common as the potato.

To Our Household Correspondents.

The pressure is, in part, removed from this department, though we have still on hand several good recipes waiting their appropriate season, and other material. We desire that these columns should be made the medium of communication among our readers on matters of common interest in the household. If the reader has any article of ornament or use that is particularly prized, tell us what it is and how to make it, that it may benefit entire the *Agriculturist* family, which is now spread over the whole country and even in foreign lands. A multitude of houses that we visit need just the convenience that is such a comfort to you, and would have it if it were made known. We want hints and suggestions, brief essays upon all that pertains to household economy.

How to Entertain Guests.

Emerson says: "I pray you, O excellent wife, not to cumber yourself and me to get a rich dinner for this man, or this woman, who has alighted at our gate, nor a bed-chamber made ready at too great a cost. These things, if they are curious in, they can get for a dollar at any village. But let this stranger see, if he will, in your looks, in your accent and behavior, your heart and earnestness, your thought and will, what he cannot buy at any price, at any village or city, and which he may well travel fifty miles, and dine sparingly and sleep hard, in order to behold. Certainly let the board be spread and the bed be dressed for the traveller; but let not the emphasis of hospitality be in these things. Honor to the house where they are simple to the verge of hardship, so that the intellect is awake and sees the laws of the universe, the soul

worships truth and love, honor and courtesy flow into all deeds."

The most obtuse must see in this quotation the whole philosophy of hospitality. One of the greatest delights of having a home of our own is to have in it a place for friends and strangers. We do not build a house simply to meet the wants of our own families. We have one or more guest chambers and the extension table, to which we may welcome our friends. The larger a man's means, the more liberal provision he makes for hospitality. They are greatly to be pitied who can barely supply their own physical wants, who dwell always in narrow quarters, who have no pillow or plate for friend or stranger. The farm-house generally has room enough for all, and some that we would have an indefinite power of expansion, that rivals India rubber. The rail car of our cities is not more accommodating. There is always room for one more, and where the welcome is so hearty, the one more sends his regrets for absence, and comes next time. There are others with houses roomy enough, but unblest with friends the year round. No one breathes the fragrance of their roses, or wipes the bloom from the clusters that are supposed to grace their tables. They live to themselves very elegantly and comfortably, it may be, but very narrowly and selfishly. The door-step is always clean, and the lawn in front always shorn. It is kept for the eyes and not for the feet. No children play there. The dogs are not at home there. We hope the folks are, and enjoy it.

There are others who would like to make their friends welcome, but spoil their pleasure by over exertion. The guests are made to feel uneasy by the visible effort put forth to entertain them. The whole secret of putting our friends at their ease is to be at ease ourselves. And in order to be thus, we must not misinterpret their visit. They have not come to see our furniture, our equipage, our dress, but ourselves. Courtesy, then, rather demands our society and conversation than our silver ware and cookery. There is no objection, of course, to the best tea urn and the cups and saucers to match, but they should set upon the table as if they were every-day ware. By all means kill the turkey, if that is your humor, but do not tell the guest that the bird has been waiting his coming a month. Let the rare dish be served up with as much ease as if it were always upon your table. Keep your art, whatever it may be, out of sight. Do not let your guest suspect that you are making an effort to entertain him, lest he go away pained with the feeling that he has been a burden to you, and never come again. Study his aptitudes and tastes, and make him instruct you in those things of which you know little and would like to know more. He must be a rare man if he have not some experiences in life to which you are a stranger. He comes from another sphere of toil, and has different surroundings from your own. Make him your superior and benefactor, by drawing out of him his knowledge and experience for your own benefit. So shall you part at the gate, both enriched in your mental and social natures.

Nor should we turn aside wholly from the routine of our daily life to make our guests welcome. Every one would like to sit at your table knows that life has its necessary duties. Do not burden him with the thought that your business is suffering derangement and loss by his coming. Your intercourse will be all the sweeter and more profitable for coming in the intervals of your regular cares. Give him to-day only that which you have to spare to-day, that there may be no strain on the morrow to recover your lost possession, and no wish in your heart that he had not come when he did, or had not come at all.

Frost Bitten Feet.

These are in order at this season of the year, in all careless families, and in some that are quite careful. This is one of the cases in which an ounce of prevention is better than a pound of cure. But if the ounce has not been taken, and the frost has,

much depends upon timely remedies. The feet should be put immediately into cold water and thawed out very gradually. The sudden thawing does more injury than the frost. Apply sweet oil or the glycerine ointment mentioned in last month's Basket, to the injured parts, and keep quiet until the system has time to repair damages.

To Prevent Stoves from Rusting.

A correspondent asks how to prevent stoves from rusting. One who speaks from long experience recommends common stove blacking, and no kind of oil but elbow grease. Much depends upon the condition in which stoves are put away, and upon the place of deposit. If in a filthy, rusty condition, they will rust still more. If put in a cellar or damp place they will be likely to rust with any amount of polish. If thoroughly polished—the elbow grease not spared—and set in the garret or upper chamber, they will ordinarily go through without damage. But as mortals are engaged in the manufacture of stove polish, and as servants that ply the brush are also mortal, we advise the housekeeper to look occasionally at stoves not in use.

Recipes for Cooking.

The following are contributed by Mrs. D. W. Sutton, Westchester County, New York.

Crumplets.—Make a batter of one quart of milk and flour, add a little salt, and one half cup of yeast; when very light, add nearly one cup of butter; bake on a greased griddle in rings.

Muffins.—To a batter of one quart of milk, add 4 eggs, a little salt, and half cup of melted butter; may be baked in small tins in the oven instead of in rings on a griddle. They may be made of rye.

Cream Muffins.—One pint of cream, one pint of flour, a little salt, and three eggs, well beaten, and one half teaspoonful soda; stir the whites in last. Nice baked in new cups, kept clean with dry cloth, and not wet or greased.

Rusk.—One pint bowl of light sponge, with two potatoes mashed *fine*, added while warm; one half cup of melted butter, one cup of sugar, sponged with two cups of milk. When light, knead up and make into biscuits, or roll out with a tumbler; place close together, when very light again, bake; when a little browned, wash with sweetened milk.

Rusk with Eggs.—One pint bowl of light sponge, one half cup of melted butter, one cup of sugar, and two to four eggs, sponge. When light, knead and form into biscuit; then when very light, bake. If washed with sweetened milk or water when nearly done, it will give them a nice color. The same recipe will also make nice doughnuts.

Pop Overs.—Batter two cups of milk with two cups of flour, add the yolks of two eggs, a little salt, lustily the whites; bake in small tins.

Corn Griddle Cakes.—Three cups of meal, one cup of flour, one cup of sour cream, one cup of sugar, three eggs, well beaten, a little saleratus and salt, thinned with milk.

Potato Cakes.—To a scant half peck of potatoes grated, add two eggs, salt, thicken with a little flour, and fry in a spider, or bake. Boiled grated potatoes may be used, but are not quite so nice.

Soda Biscuit.—Rub up fine into five tumblers of sifted flour a lump of butter or lard the size of a large egg; if lard, add more salt. Before the flour is sifted, stir in one teaspoonful of soda, and two of cream tartar, thoroughly mixed; add enough sweet milk or water to make it knead nicely, then either make into cakes with the hand, or roll out and cut up to suit the fancy, and bake in a rather quick oven. *Another.*—Eight tumblers of flour sifted with two teaspoonfuls of soda, and four of cream tartar, and butter the size of two eggs, and wet with sweet milk enough to knead nicely. Sour milk and less shortening may be used, instead of cream tartar which disagrees with some.

BOYS & GIRLS' COLUMNS.

What Little Folks Can Do.

A great army with banners flying, drums beating, and guns brightly gleaming in the sunlight, marched to overpower the forces of a nation with which they were at war. They had been victorious in many a hard fought battle, and their present foes were already retreating before them; they were sure of another triumph. "How can we withstand them?" anxiously inquired the generals of the retreating force. "If the little white warriors of the North would only come to our aid, then we need not fear," they said among themselves. Still the army advanced like a torrent that nothing could hinder. "See, here is a great city," they exclaimed, as they drew near a famous place, where churches, towers, stores, and dwellings, spread out before them for miles. "Here will we rest, and have merry times in the houses of our enemies!" and they thought of the gay revels they had enjoyed in other cities. "Let us get the red people to help us," exclaimed the retreating force, as the invaders drew near. They had always kept the red people for servants. These were very savage in their disposition, and also very hungry, and had they not been carefully watched, would have eaten up or destroyed everything the city contained. "Yes, we will set the red people free," said the desperate fugitives, "and they shall fight our foes until the white warriors of the North come to our assistance." So every man turned his servants loose, giving them permission to hold a grand carnival. Away they flew as though mad with delight. They whirled through the houses, seized upon everything within their reach, climbed upon each other's shoulders to get at the highest places, and soon were in a most furious frolic. "Fire!" "Fire!" shouted the soldiers, for soon these imps had the whole city in a blaze. Houses, stores, churches, and towers, came crashing to the ground, and the red people danced about the ruins in frenzied glee. In vain the soldiers fought them; not until the proud city was in ruins did the terrible carnival end, and the red people sink away and hide themselves in holes and corners. But now a more terrible foe appeared. The white warriors of the North came riding to the conflict, each on a snow white charger, and armed with a diamond pointed spear. Yet they did not seem so terrible, for they were so small that you might hold more than a hundred of them in your hand, and crush them all by closing it. But then there were such countless numbers of them, and they were so bold! As far as the eye could reach, they appeared trooping in sight, and day after day, and night after night, they still came on. They would charge right into the midst of the fierce soldiers, smite them in the face, strive to pierce their heavy boots, entangle their feet, and with blow after blow they so kept up the contest that ere long the bravest men lost heart, the stoutest horses were overcome and sank exhausted upon the field. A retreat was commenced, but still the little white warriors came pouring on, and of the hundred thousands of men who marched forth so confidently, but a straggling handful ever returned to tell of the horrible sufferings they had endured, and of the sad deaths of their companions in that terrible retreat from Moscow. There! now, you have discovered that the red people were the little sparks of fire, and the white warriors were only snow-flakes, and remember that by each little one doing his part, great things were accomplished. So, little folks, do your part in this world well, and more wonderful things yet will follow.

Bread Cast on the Waters.

A young man living in New York at the time of the discovery of gold in California, was led by the prevailing excitement to sell all he had here and travel to that land of promise. He arrived safely, made his way to the mountains, and worked hard for months, but with little success. Soon his money was gone, his clothes nearly worn out, and he must either starve or find his way back to San Francisco, and get employment there. He started on foot, and slowly made his journey. One afternoon he came to the bank of a stream which must be crossed. A ferryman was ready with a row boat. "What is your charge?" asked the traveler. "One dollar, sir." "Well, I shall have to foot it up the stream until I can find a crossing place." "Are you hard up?" asked the ferryman. "I'm dead broke," was the desponding reply. "Jump in, I'm not the man to send a fellow adrift!" and with a few vigorous strokes they were soon in the middle of the stream. Here the boatman stopped rowing and, looking into his face, asked, "Is your name Jones?" "Yes," replied the other, with a start at finding himself recognized. "Didn't you rather belong to the church in — street?" "Yes," "I thought so," and with that he drew from his pocket a bag and commenced counting out gold pieces. "I have made five hundred dollars by ferrying passengers; here are three hundred of them for you. You can pay me when you are *flush*, or if that don't happen, then all right. You think I'm crazy, perhaps,"

continued he, observing the astonished looks of the traveler, "but I was never in better senses in my life. When I was a little boy and my mother was a poor widow, many a time has your father visited our home, and when he had gone, somewhere about the room we would find money for a barrel of flour, or to pay the rent, when we knew not before where it was to come from; and as long as I live, if I have only a crust, when I find one of his sons in want, he shall get the biggest half." The loan was gratefully accepted, by its aid the traveler was able to reach San Francisco, earn enough to repay his benefactor, and return safely to his home. This story, with the exception of the name, is a true one, related by the traveler himself, illustrating the precept, "Cast thy bread upon the waters; for thou shalt find it after many days."

Habits of Sheep—A Man in a Ludi-crous Position.

An exchange publishes the following: "Sheep perseveringly follow their leader wherever he goes; but, if in case of sudden alarm, any one of the flock runs forward to escape, and thus takes the lead, the rest generally follow him, regardless of any obstructions. Of this singular disposition we once witnessed an instance in Cleveland, Ohio. A butcher's boy was driving about twenty fat sheep through the city; but they ran down a street along which he did not want them to go. He observed a scavenger at work with his broom a little way before them, and called out loudly for him to stop the sheep. The man accordingly did what he could to turn them back, running from side to side, always opposing himself to their passage, and brandishing his broom with great dexterity; but the sheep, much agitated, pressed forward, and at last one of them came right up to the man, who, fearing it was about to jump over his head while he was stooping, grasped the short broomstick in both hands, and held it over his head. He stood for a few seconds in this position, when the sheep made a spring, and jumped fairly over him, without touching the broom. The first had no sooner cleared this impediment than another followed, and another, in such quick succession that the man, perfectly confounded, seemed to lose all recollection, and stood in the same attitude till the whole had jumped over him, not one attempting to pass on either side, though the street was quite clear. As this took place during wet weather, as may be easily imagined, the man was entirely bespattered with dirt before they had all passed; and it is impossible to conceive a more ludicrous appearance than the poor fellow made on the occasion.

Tumble Bugs.

I suppose all little people who have ever lived in the country are acquainted with the dusty, awkward, black beetle, which often goes by the name of tumble bug. The name was probably given to it because it is always rolling about a great ball of manure twice as large as itself, and tumbling over it in a very ungraceful manner. This seems rather hard ball playing to be kept up all the long summer days, and, in fact, it is no play at all, but real work—the daily work of this beetle, just as all other beetles, bugs, and flies, have their work, each in its own way, while they seem to be humming and buzzing so lazily in the sun.

It is easy to see that this rusty, tumble bug beetle is a plebeian among insects, quite coarse and dirty—or, as some people might say,—disgusting. While the wealthy, respectable bee is making beautiful little cells of wax for her future young, and laying up great stores of rich, sweet honey for them, the mother tumble bug is just as busy providing for her children according to her means and understanding. Not knowing how to make wax-cells, and having no suitable wings to fly among the flowers for honey, she lays her eggs on a bit of soft, barnyard manure, and then rolls it over and over with great patience, until the ball is large enough to supply her young ones with food as long as they are unable to help themselves. In time, little maggots come out of the eggs,—for the infant tumble bugs are not at all like their mother,—and it is only after they have eaten their way out of the balls that they gradually change from their grub or larva state into dusty, hard working beetles.

A Railway Incident.

The Duke of Argyll and the Duke of Northumberland were traveling together in a railway car in England, when a traveling salesman entered the apartment with them. All were very sociable and the conversation was unrestrained, the clerk not knowing who were his companions. At one of the stations the Duke of Northumberland got out and was received by a large number of servants, who conducted him to his splendid carriage that stood waiting. "That must be some great *arist*," said the salesman to the remaining Duke. "That is the Duke of Northumberland," was the reply. "Is it possible," replied the salesman, much astonished, "and only to think how free he was with two *little snobs* like us!"

New Puzzles to be Answered.

No. 296. Puzzle Picture.—The Old Man of the Woods will be found somewhere in company with the baboon; the latter is much the better looking of the two.

No. 297. Illustrated Rebus.—Well worth remembering.

No. 298.—A large animal mentioned in the Bible.

Answers to Problems and Puzzles.

The following are answers to the puzzles in the January number, page 27. No. 291.—"Plow deep while sleep, and you will have corn to use and to sing." No. 292.—"Waste not, want not." No. 293.—"Columbus in chains." No. 294.—"Be backward in nought, but be over on time." No. 295.—"A Roman knows no fear. The following have sent correct answers to some of the puzzles previously published. W. F. Gale, L. Ford, Alfred Bebie, L. M. Wright, H. Augusta Worcester, R. M. Swan, J. Milton Snyder, W. T. Fuller, E. H. Field, H. L. Horner, Jr., Sanford Horton, N. E. Melick, "F." D. Noon, M. A. Harbush, J. Milton Snyder, Geo. C. Pontz, S. W. Smith, Jas. W. Foster, C. Sumner Warhouse, Willie W. Stockton, Ray Billingsley, John Anstin, Richard H. Wilson, Madeline Burr, C. J. Thomas, "Time-piece," J. H. Gray, Wm. H. Heath, Isaac Wall Linn, Isabella Lucy Stewart, Geo. M. Buck, J. H. Gray, Mollie Kerr, Knickerbocker, Martin H. Horning.

[COPYRIGHT SECURED.]

THE TIRED MATCH GIRL. — Engraved for the American Agriculturist by J. Langridge.

Poor, tired, girl! We should not like to follow her in her daily round, through the long streets, into the stores, up and down the stairs into offices, repulsed with a gruff "no," by busy men, hustled out of doors by rough porters, stared at, teased, perhaps insulted, by thoughtless or vicious boys, and seldom greeted with a kind word. If this life be continued, in a few years that fair, round, face, will be sharpened by exposure and want, and its sweet expression spoiled by the evil thoughts and passions which street life is almost sure to produce. Why should the child be thus pitilessly thrust out into the world? The place for her is at home under the tender care of a mother, or at school, to be guided by faithful teachers to intelligent, useful, virtuous, and happy life. But she has no home. The place where her drunken father and sick mother stay is some dark, cold, garret, or damp and filthy cellar—the street is better than that. She is driven forth, day by day, with threats of punishment, if she fail to bring home a certain amount at night, and the threats are not idle words, for she has often suf-

fered cruel beatings from those who should have been her protectors. Such is the history of hundreds of little "Match girls" in New York and other large cities; girls that, sheltered by such homes as you are blessed with, would be as happy, as attractive, perhaps more worthy every way than those who now despise them because they are poorly clad and live in the street. Think of these things when tempted to speak harshly to such unfortunate ones, or when unhappy because you may not have some things which the children of richer people enjoy; and when it is in your power do something to add at least a smile to the life of these friendless ones!

Seeing the Chips Fly.

Some years ago, a young New Englander found himself in the back part of Pennsylvania, a-horse as to the means of living. In this strait he applied to a wealthy Quaker in the neighborhood for help. "I will furnish thee with work, and will pay thee for it, friend," said the

Quaker; "but it is not my custom to give alms to one that is able to labor, like thee." "Well, that's all I want," said the Yankee; "of course, I am willing to work." "What can thee do, friend?" "I will do anything to get a little money to help me out of my difficulties." "Well, there is a log yonder, and there is an ax. Thee may pound on the log with the head of the ax, and if thee is diligent and faithful, I will pay thee a dollar a day." "Agreed; I'd as soon do that as anything else." And so the youth went to work and pounded lustily with the head of the ax upon the log. After a time he paused to take breath; then he began again. But after half an hour he stopped, threw down the ax impatiently, and walked away, saying, "I'll be hanged if I'll cut wood without seeing the chips fly!" He could not be blamed much, for nothing is more laborious and unsatisfactory than continuing to work without seeing any results.

Conundrum.—With what sort of a throat can a singer reach high notes? A soar throat, to be sure.

"FIGHTING AGAINST WORMS,
and for
THE GOOD, THE TRUE and THE BEAUTIFUL!"
THE

Little Corporal

Is acknowledged by Press and People almost universally to be THE BEST PAPER for Boys and Girls ever published in this country.
It is edited by ALFRED L. SEWELL, and EMILY HUNTINGTON MILLER.
Volumes begin July or January. Back Nos. supplied. Terms, One Dollar a year. Sample copy sent without charge.
GREAT INDUCEMENTS are offered to those who wish to raise clubs.
Address, ALFRED L. SEWELL, Publisher, Chicago, Ill.

CARD

TO NURSERYMEN, DEALERS, AND LARGE PLANTERS OF

Grapes, Strawberries, Raspberries, Blackberries, Gooseberries, Currants, &c.

Heretofore we have not been able to offer any special inducements to the Trade as the supply for our grape vines has been confined chiefly to planters. Our sales, though made to parties all over the country, have been to us the most efficient kind of advertising, and dealers being so often required of for our stock, have urgently applied to us for a supply. We have been preparing as rapidly as possible to meet these requirements. Our grounds have been enlarged and our facilities greatly increased for the production of such articles as we offer.

Our present stock of vines and plants is much the largest and best we have ever offered, and cannot fail to give entire satisfaction to the purchaser, whether he buys to plant or sell, and our prices will be found as low as the same quality of a genuine article can be had anywhere.

All who have examined our stock, pronounce it unsurpassed in excellence and cheapness.
Mr. M. B. BATERMAN, Sec. of The Lake Shore Grape Growers' Association, and of the Ohio Horticultural Society, says of our grape vines:

"Having visited Mr. Knox's grounds, and inspected his stock of grape vines, several times during the season of growth the present year, (1887), I can state that your thriftness of growth, as well as freedom from disease, his stock of young vines is as good as I have ever seen, and the best of equal extent and variety within my knowledge at this time. The assortment of varieties is very complete, embracing all the popular kinds in good proportion—the supply of Concord and Free is especially large and fine. The prices I regard as quite reasonable for the quality of the stock."

The New Edition of our Descriptive and Illustrated Catalogue, of 64 pages, and our Wholesale List (for dealers only) forwarded to applicants enclosing 10 cents.

Cards, Circulars, Order Books, &c., furnished those who buy to sell again.

James J. H. Gregory, GROWER & IMPORTER OF CHOICE VEGETABLE SEEDS, Marblehead, Mass.

As the original introducer of the Hubbard Squash, Marblehead Mammoth Cabbage, and many other choice vegetables, I invite the attention of the public to my Seed Catalogue for 1868, which will be sent free to all applicants. Those who sent to me for seed last year will receive it by writing for it. *Take note and pure vegetables a specialty.* I have cultivated on my three-acre farm this season over fifty acres of seeds and seed stock. These farms are over a mile from each other, and the fields of two of them are much scattered, thus giving me the ability to grow many varieties of seed of the same kind, while each variety is so perfectly isolated as to ensure purity. On these three farms I have raised over 100 varieties of vegetable seeds the past season, including nine varieties of Cabbage Seed, eighteen of Tomato, five of Onion, six of Beet, four of Carrot, seven of Cucumber, five of Corn, five of table Peas, nine of bush Beans, six of pole Beans, seven of squash, four of Mangel Wurzels, &c., &c.

I can import or buy, as chance offers, much of this seed about about one half of what it costs me to raise it, but I do so that I affirm what I know, as to its purity and freshness. He selected the stock, planted it, gathered the seed, and prepared it for market, and thus you who plant it have this invaluable guarantee from his own knowledge of it. *He that may be able to give this guarantee that I grow so many varieties at double what it would cost me to purchase any of them, while at the same time the public will not find my prices for standard seeds higher than those of other dealers of repute. There are many varieties which I have to import, and others that I have to purchase from growers; with these I use my best judgment and experience for the security of my patrons.*

If the public wish to encourage this enterprise (which I doubt not) and procure their seed directly from the grower I invite a contribution and fair share of the patronage that they have heretofore so liberally bestowed.

JAMES J. H. GREGORY, Marblehead, Mass.

CURTIS & COBBS'S SPRING CATALOGUE, 1868.

Our new descriptive priced Catalogue of over one hundred pages of Vegetable and Flower Seeds, embracing all the novelties and specialties of the season, and a full list of choicest gardeners, will be ready early in February to mail to all applicants enclosing us ten cents. Regular customers supplied without charge. **CURTIS & COBBS,

**J. M. THORBURN & CO.,
15 John-street,
NEW YORK.**

Have the pleasure to announce the completion of their Catalogue of Flower Seeds and Spring Bulbs for 1868.

Resurrection Plants 25 cts. each, by Mail.

CABBAGE SEED, IMPROVED BRUNSWICK.

The Earliest, Shortest Stemmed, and very best Drumhead yet offered. The Boston Market Gardeners all use it in preference to any other, and to show how highly it is esteemed in this market, we will state that it sold readily at \$4.00 per ounce the past season, and all were well satisfied that it is the best variety for either early or late planting; every plant produces a good head, when fully grown, weighing from 20 to 25 lbs., and requiring only ordinary cultivation; the quality is excellent. Mr. John Stone of Marblehead, Mass., the originator of the well-known Stone Masson Drumhead, allows us to state that he considers it far superior to any Drumhead he has ever seen; he has raised good sized heads from the seed in 55 days from planting the seed. We warrant our stock the purest in the country. For sale in 50 or 60 cent packages.

We have also to offer a small quantity of the *Early Boston Market Tomato Seed*, the best variety for market or family use, price 10 cents per package. By enclosing the amount of your order, we will forward the seed free by mail, send early, as our stock is limited. Send for Circulars, and Catalogues of Seeds.

Seed Warehouse, No. 10 South Market-st., Boston, Mass.

Correspondence in English or German.

Jersey Wakefield Cabbage.

Early Rose Potato.

For a description of this new and valuable variety, see our advertisement in the *Agriculturist* for January, page 32. The following editorial notice from the same paper confirms all that has been said in its favor:

From the *American Agriculturist* of January.

"The Early Rose Potato.—This is a seedling of the *Garret Chili*, but unlike its parent in color and quality. Mr. Hedron of Utica, its introducer, informs us that it is more productive than the *Early Goodrich*, and ten days earlier. It is a very fair and handsome potato, and of most excellent quality. We were present at the trial of some fifteen varieties by a committee of the Penn. Hort. Society, and considered this the best of all. Mr. H. has disposed of his stock to B. K. Bliss & Son."

In consequence of the limited supply, we can only offer it in *One Pound Packages*, which will be sent by mail, post-paid, upon receipt of \$1.00. Orders will be booked in their regular order as received, and potatoes forwarded as soon as the weather will permit. Address
B. K. BLISS & SON, Box 5712, P. O., New York,
Or, 231 Main-st., Springfield, Mass.

SEED POTATOES

Of all the leading varieties, among which are Goodrich's justly celebrated *Harrison*, *Early Goodrich*, *Gleason*, *Calico*, *Cato*, and *Garnet Chili*—to say nothing of *Handsworth* and *Sutton's Hackhorse*, two of the earliest varieties known. *Early Sebec*, or *Boston Market*, *Extra Early White*, *Early Stevens*, *Dykeman*, *Jackson White*, *New White*, *Peach Blossom*, also, *PATERSON'S CELEBRATED ENGLISH SEEDLINGS*, viz.: *Napoleon*, *Victoria*, *Irish Blue*, *Scotch Blue*, *Sherry Blue*, *Forfarshire Red*, *Regent*, *Seedling Rock*, also *King of the Potatoes*, *Early Frayne*, *Red Regent*, *British Queen*, etc. *Four Pound Packages* of either of the above varieties will be mailed to any address, post-paid, upon receipt of *One Dollar*. Six packages, \$5.00; twelve packages, \$9.00. Prices per bushel or barrel will be given upon application.

New English Varieties

Not Before Offered in this Country.

Our stock of these being very small, they are offered in *One Pound Packages* only, which will be mailed to any address upon receipt of *One Dollar*.

Wheeler's Milky White.—A seedling from the *Fluke*, a second early variety of delicious flavor, and in color as white as milk, remarkable for its freedom from disease, highly prized by English cultivators.

Mona's Pride.—A very early Kidney Potato—of medium size, and of excellent quality—fine for forcing.

Our Descriptive Price List of potatoes will be mailed to all applicants.

(No. 1.)

PRANG'S AMERICAN CHROMOS are the most beautiful of Color Pictures, by the late Mr. Prang. They are artistic copies; and, in most cases, fully equal to the originals. An eminent critic says of our Chromos of "Fair's Grouping":

"Mr. Louis Prang, of Boston, of whose efforts to disseminate through the country lateral copies of our wild flowers, butterflies, moths and birds, in such pretty forms, and so cheaply, as to drive out of the market all inferior publications, has just issued a chromo-lithograph in oils of one of Mr. A. F. Fair's clever little pictures. The chromo-lithograph is a perfect facsimile of the original painting, reproducing not only the beautiful colors, but the very lines of the canvas, in a way that surprises by its identity. Mr. Prang tries with all his might to make his imitations absolutely deceptive, not for the purpose of deceiving, but in order to put faithful copies, 'as good as the originals' within the reach of small purses. He brings to the work knowledge, business energy, and enthusiasm, and what is more, a generous spirit towards art and artists, which is very pleasant to meet with. We have our cordial thanks for what he has already done, and our trust that he will be able to propagate the class of works for in the love of what is true as well as beautiful."

GROUP OF CHICKENS. (10 x 12 inches) \$5.00

GROUP OF DECKLENS. (10 x 12 inches) \$5.00

GROUP OF QUAILS. (10 x 12 inches) \$5.00

Ask for them at the Art Stores. They will be sent free of expense, to any address on receipt of the retail price. Our *Journal of Popular Art* describes how these pictures are made, and contains articles and letters by several eminent Americans.—mailed free. Address L. Prang & Co., Fine Art Publishers, Boston, Mass.

BY MAIL.

A COMPLETE ASSORTMENT OF

**Grapes, Strawberries,
Raspberries, Blackberries,
Gooseberries and Currants.**

FOR \$10.00,

FOR \$20.00

We will send to any Post-Office address in the United States,

GRAPE VINES.

Lilium Auratum.

New Golden Rayed Japan Lily

At Greatly Reduced Prices.

We are happy to inform our friends that we have received a large consignment of this magnificent Lily, only sixty days from Japan—in splendid condition, which we can offer at greatly reduced prices. This species is reputed to be the most beautiful of all known Lilies. Its wonderful proportions and peerless symmetry of bloom, surpass all accounts given by travelers—and plants exhibited since its introduction into this country have more than realized the great anticipations of its ardent admirers. The individual blossoms are from eight to ten inches in diameter, of delicious fragrance, ground color of pearly white, which is suffused with golden rays, faintly delicately studied over with spots of rich chocolate crimson, with a golden ray or stripe running through the center of each petal. It is perfectly hardy, besides being admirably adapted for pot culture.

Strong Flowering Buds.....	\$1.50 each;	\$2.00 per dozen.
Second size, do. do.....	\$1.00	\$6.00
Third do. do. do.....	.75	6.00

The Trade supplied upon the most liberal terms.

New Tomatoes.

Sims Early Cluster.—A new variety introduced the past season from England, which is thus described by the raiser. "Very early, of extremely robust habit, requiring little support, fruit averaging 5 to 6 inches in circumference, round, smooth, of fine flavor, and enormously productive—bearing its fruits in grape-like clusters, averaging from four to twenty in each cluster. It was raised by Mr. Sims, gardener to Mr. Vederhaus, Dierich Common, and is highly recommended by all who have tried its quality." Per packet, 25 cents; five packets for \$1.00.

The Orangefield Dwarf Prolific.—Another new English variety introduced the past season, is a sport from the old *Large Red Tomato*, selected and perpetuated by Mr. McLachlan, Orangefield, near Belfast, Ireland, who thus describes it: "After four years' careful trial it has proved to be one of the finest tomatoes we possess. Plant very dwarf, but strong in habit, never shows any signs of being stunted or diseased, very productive, and well adapted for culture under glass as it will stand forcing without drawing. This variety grown in pots, makes really beautiful decorative plants for the Conservatory." The following is an extract from the report of the trial of Tomatoes grown at Chiswick, 1867: "The Orangefield is the earliest of the large, fruitful sorts; it is very dwarf and prolific, bearing its fruit within six inches of the ground. It is an excellent variety, and one of the best in the collection." 25 cents per packet; five for \$1.00.

Cedar Hill Early.—A new American variety, in high favor among the farmers and gardeners in the vicinity of New York, contains the qualities of earliness, size, solidity, productiveness, in a greater degree than any other variety. 25 cents per packet; five packets for \$1.00.

One packet of the three above varieties for 60 cents.

Also, the following well-known varieties, Mammy's Superior, Fildens's, Extra Early York, Cook's Favorite, Mammoth Chalmers, Powell's Early, Keyes' Early, at 10 cents per packet. Early Apple, Large Red Smooth, Pear Shaped, Yellow Plum, Grand Yellow Cherry, Fejee Island, New White, Large Yellow Strawberry, at 10 cents per packet.

Grape Vines & Small Fruits.

Splendid Delaware varieties; Concord, Hartford, Ives, Iona, Salemi, and other valuable grapes, at greatly reduced prices. Kittanning Blackberry, extra strong plants, \$20 per 100; \$150 per 1000. Clarke, Philadelphia, Kirtland, and other Raspberries, Currants, &c. Send stamp for Descriptive Price List to G. W. CAMPBELL, Delaware, Ohio.

New, Rare, or Choice Seeds.

I send out to the Public my Annual List of New, Rare, and Choice Vegetables. Having been the original introducer of the Hubbard Squash, Marblehead Mammoth Drumhead Cabbage, Marblehead Mammoth Sweet Corn, and many other new Vegetables, I am ever ready to introduce to the Public every new vegetable product that comes to my notice, that I think worthy of their attention.

FETTLER'S IMPROVED BRUNSWICK CABBAGE.—(The earliest of all hard-headed Drumheads, grows heads 12 to 18 inches in diameter, in 90 days; a new cabbage very popular with marketmen.)

MARBLEHEAD MAMMOTH CABBAGE.—(The largest cabbage in the world, has been grown to weigh from 25 to 60 lbs. in almost every State in the Union. See my Circular. Seed, pure; it was the original introducer.)

STONE-MASON'S EARLY CABBAGE.—(A hard-headed, short stump. About every plant on an acre will fit a fine head; it is a harder and sweeter cabbage than Flat Dutch. In half-season packages.)

CANNON BALL CABBAGE.—(This matures with the Wittenstaadt, with heads about as round and hard as a cannon ball.)

LENOXMOND'S MAMMOTH CAULIFLOWER.—(Doubtless the largest of all the Cauliflower family. Very reliable for heading.)

CARTER'S NEW DWARF, MAMMOTH CAULIFLOWER.—(Very early, hardy, larger than Walcheren; excellent for forcing or for general use.)

EARLY DWARF ERIFFURT CAULIFLOWER.—(The most compact growing of all the dwarfs; excellent either for forcing or for general use.)

CHINESE CABBAGE.—(The leaves are more tender, and the flavor more agreeable than that of common cabbage.)

ORNAMENTAL KALE.—(Foliage elegant in structure and color, very ornamental.)—NEW YORK IMPROVED LARGE LEAFED EGG PLANT.—(A new and better purple than common kind.) NEW LONG EARLY PURPLE EGG PLANT.—(A decided improvement in earliness on common Early Long Purple.) STRIPED GUADALUPE EGG PLANT.—(A very early and beautiful variety, good for table use.) CHINESE SCARLET EGG PLANT.—(Of a magnificent scarlet color.) MARBLEHEAD MAMMOTH SWEET CORN.—(This has taken the first prize at the Annual Exhibition of the International Seed and Vegetable Congress; ears weigh from two to three pounds; excellent for table use.) MAMMOTH FRENCH SQUASH.—(Grows to weigh from 100 to 200 lbs.) VEGETABLE CATERPILLARS.—(The seed resembles the natural animal.)

SNAKE CUCUMBER.—(Grows three feet and more in length, coiled, and very like a snake with its head raised.)

NORBITON GIANT CUCUMBER.—(The finest, longest, and most prolific cucumber cultivated.)—a great English Seed Firm says; and it ought to be, as they charge me over 157 dollars a pound for the seed! I send ten seed in each package.)

LAWTON'S PROLIFIC LONG-POUNDED PEA.—(The longest podded of all peas, some pods having from ten to twelve peas,) so the Englishmen say. COMMODORE NITE SUGAR PEA.—(A remarkably dwarf string pea, growing no higher than Tom Thumb. Pods and all are eaten.)

BAYARD'S PATENT WATERMELON.—(A very early, highly productive variety.)

PERENNIAL LETTUCE.—(Distinct from all other varieties; leaves used as salad, or served as spinach.)

CEDAR HILL TOMATO.—(Of this new tomato the Horticultural Society of New York has awarded a gold medal for its sweetness, solidity and flavor.) My seed came directly from the originator. Package of either of the above varieties sent to any address with full directions for cultivation, and warranted to reach the purchaser, at 25 cents each.)

IMPROVED AMERICAN SAVOY CABBAGE.—(Heads large, very reliable, excellent either for family or market. The Savoy is the tenderest and richest flavored of all cabbage.)

EARLY FANCLAY SAVORY.—(A new ULM SAVOY,—each of these are ten days earlier than Early York; very sweet and tender; choice for family use.)

LITTLE FINE.—(Also ten days earlier than Early York, and probably with the two above the earliest of all tender, round, heads, round, solid, hard, tender, and sweet.)

BURNEL'S KING OF THE DWARFS.—(A large, conical cabbage; very early.)

SCHWEINFURTH QUINCE.—(This new early cabbage from France is the earliest of all tender, round, heads, round, solid, hard, tender, and sweet.)

FIELD CABBAGE.—(Grown as green food for stock, can be cut several times.)

JERSEY LONG KALE.—(Grows six feet high or more; has good, tender, satisfactory and tender for milk cows.)

BATES' EXTRA EARLY SWEET CORN.—(Wrinkled kernel, sweet, excellent; comes in just before Crosby's.)

CROSBY'S EARLY TWICE ROWED.—(A decided acquisition. This is the earliest sweet corn of a good market size; tender and sweet.)

MEXICAN SWEET CORN.—(Both the sweetest and tenderest of all corn, as Americans can testify.)

MAMMOTH MEXICAN SWEET CORN.—(A new variety, matures as far north as Central New England.)

OLD COLONY SWEET.—(Very productive; ears large, tender, sweet. Does well either North or South.)

HEBEARD'S EARLY CORN.—(Seed, pure. It was the original introducer of this, the richest of all winter squashes.)

AMERICAN TURK SQUASH.—(The dried, husked, grain, and sweetest of all fall squashes.)

THE LITTLE GREEN MARROW.—(My variety is the earliest and best found in the country.)

INTRODUCED LONG GREEN CUCUMBER.—(The largest of the long green varieties.)

MCLAN'S LITTLE GEM PEA.—(A great acquisition, a wrinkled pea like Champion of England, grows well, but about a week earlier.)

CARTER'S FIRST CUP.—(About a week earlier than Early Don, O'Rourke.)

TOM THUMB PEA.—(Grows 10 inches high; crops enormous; seeds large and well filled; very early.)

EARLY DWARF MEXICAN SWEET CORN.—(A new variety, matures as far north as Central New England.)

MARROWFAT CABBAGE.—(A new variety, matures as far north as Central New England.)

POULTRY,

Imported and our Own Breeding.

Our stock having taken about twenty premiums at the
late Poultry Exhibition, now stands confessedly superior to
any in the country, the Judges who awarded the \$25
Silver Cup premium, (which was also taken by us), pro-
nouncing them in their opinion, "the most superior collection
of fowl ever exhibited in this country by any one party."

We have also purchased a number of prize pens in addition
to our own. To make room for a new and still finer stock
shortly to arrive from Europe, we offer a number of our
prize birds as well as our other stock, for sale. Six Pair of
Imported Rouen Ducks for sale cheap. For Circulars ad-
dress

Premium Chester White Pigs For Sale

First Premium awarded us for the best breeders at our
Pennsylvania State Fair in September last. Also, a special
Premium recommended by the Inspecting Committee, on
our herd of twenty-five head, under 6 months old. These
premiums were taken over a display of one hundred and
thirty head, principally owned by parties from Chester Coun-
ty. We are as choice in selecting for those who order of us,
as we would be in selecting for exhibition. Pigs of any
age shipped by Express to all parts of the United States. Ev-
ery purchaser is guaranteed living stock in the best of order
and of the purest blood in our county. For Circular, address
JAMES YOUNG, JR., & CO., Marshallton, Chester Co., Pa.

SWINE.—27 pages devoted to Breeding, Feed-
ing, and the general management of swine, sent to any
address on receipt of 25 cents. Worth ten times its cost.
Every farmer should have it. Address JAMES YOUNG, JR.,
Marshallton, Chester Co., Pa.

BEE-KEEPERS!—The Ohio Farmer says: "Its
Bee must save many a lightly stocked hive of bees from
starvation during winter." Feed your bees. Send \$2.50 for six
feeders. Agents wanted. ED. HARRISON, Springfield, O.

FOR SALE.—A few pairs of Grey Dorking and
light Breasted variety. Also, a good Devon cow,
and a beautiful Shetland pony. C. O. FOLLE,
Metuchin, N. J.

"PEERLESS."

FIRST GRAND PRIZE MEDAL

AWARDED

PRATT & WENTWORTH

FOR THE CELEBRATED

"Peerless" Cooking Stove,

AT THE EXPOSITION UNIVERSELLE,

PARIS, 1867.

First Premium at Am. Institute Fair, 1867.
ALSO, TWELVE OTHER FIRST PRIZES TAKEN DURING
THE LAST YEAR.

The Best Cooking Stove Ever Made! FOR COAL AND WOOD.

It is the "PEERLESS," because it is superior to all other
Cooking Stoves in ECONOMY, SIMPLICITY, CLEANLINESS,
BAKING, ROASTING, and BEAUTY.

1st. ECONOMY. A patented method of heating the air
and conveying it through the oven, saves from twenty to
thirty per cent. of fuel.

2d. SIMPLICITY. It is easily managed. The fire can be
perfectly controlled, and kept through an entire season
without re-kindling.

3d. CLEANLINESS. No dust escapes while shaking or
dumping the grate.

4th. BAKING. Its large oven, wherein all parts are of
equal temperature, bakes as evenly as a brick oven, and that
without turning the article. It bakes quickly.

5th. BOASTING. A current of hot air constantly passing
through the oven, so thoroughly ventilates it that it roasts
as well as a tin kitchen.

6th. BEAUTY. Made of the best iron, it will not crack.
Well modeled, artistically designed, and smoothly cast, it is
the most beautiful as well as the most serviceable stove in the
market.

Each stove is WARRANTED to be and to do all that is
claimed for it.

PRATT & WENTWORTH,
MANUFACTURERS,

87, 89, & 91 North-street, Boston.

For sale by our agents throughout the country.

KNOX'S SEED STORE AT YOUR DOOR.—See "Seed by Mail," page 71.

A. N. WOOD & CO.,

EATON, MADISON CO., N. Y.,

Manufacturers of their Celebrated PORTABLE ENGINES.

For Farm and Mechanical purposes. They are particularly adapted to driving Threshing Machines, Circular Saws, Mills of all kinds, Printing Presses, Wood or Iron Lathes, Machinery in Cabinet or Wagon Sheds, Pumping Artesian Wells, Pumping Water, Corn Shellers, &c., &c.

They are mounted either on legs, like the above cut, for stationary use, or on wheels, with a pole, ready for attaching a team for moving from place to place.

Mr. W. N. PENNY, of Ivesville, Yates Co., N. Y., says in the Country Gentleman of Aug. 25th, 1867: "By the way, we are threshing by steam, using a six horse portable engine. It works to a charm, just the thing to do a nice job; it does the work of ten horses on a sweep power, and very much better."

The American Agriculturist, in editorial notes, on page 317, Sept. number, 1867, says: "STEAM THRESHERS are a prominent feature in Western husbandry. The horse threshers are still in use, but are certainly doomed as the scythe or the hand reaper. They are altogether too slow for this age. The steam thrasher is mounted upon wheels, and is drawn by horses from place to place, as it is wanted. The great advantage of the steam thrasher is that it puts the whole harvest so much into the power of the farmer. As the wheat stands in the shock until it is thrashed, and the first good weather is availed of to clean the crop, and send it to market."

The Manufacturers take pleasure in referring to the following partners, some of whom have used their Portable Engines for years:

I. ST. JOHN, Invent. and Patentee, Stamford, Conn.

AMERICAN INSTITUTE FAIR, Oct. 25, 1867, AWARDED

HENRY SEYMOUR & CO., New York.
The only Premium Medal for the best SHEEP SHEARS, *Trimming and Hedge Shears*. These SHEEP SHEARS are warranted to be far superior to "Wilkinson's" in durability and finish. Sold by all Hardware and Agricultural Houses.

American Agriculturist for Jan. 1868, says: "We have hitherto been too much dependent upon England for our best cutlery, and sheep shears were no exception. Hardly willing to trust, without the test of use, our own favorable impression in regard to the excellence of these sheep shears, made by Henry Seymour & Co. of this city, we have submitted them to the judgment of practical sheep shearers, who are much pleased with them, and to experts in steel manufactures, who pronounce an unqualified approval, confirming us in our own opinions."

IF RESPONSIBLE FARMERS will guarantee that we shall have back our Cutters or our pay, we will get their boys at work selling *Gale's Copper Strip Feed Cutters*. Send for Illustrated Circular.
PERKINS & CHAPIN, Chippewa Falls, Mass.

KNOX'S NURSERY AT YOUR DOOR.—See page 72.

Important to Farmers.

A HORSE DOCTOR FREE.

The attention of farmers and of all owners of horses and cattle is called to the fact that the old established weekly newspaper, "WILKES'S SPIRIT OF THE TIMES," employs upon its columns a celebrated Veterinary Professor, whose duty it is to answer all questions relating to sick or injured horses and cattle that may be sent to the paper by mail. The replies of the Professor to these questions appear in the next number of the paper, and are always accompanied by a prescription, thus enabling every body to serratize his mode of treatment, and to avail themselves of the remedy. These answers and prescriptions are given free to whoever may ask for them, whether subscribers to the paper or not; so that the whole cost of the prescription is the postage of the letter stating the complaint and the price of the next copy of *THE SPIRIT*. Many remarkable cures of valuable animals have been made through the medium of this department. Owners of horses or cattle are therefore advised to go to any news-stand and buy a copy of the paper, that they may examine this important feature for themselves. The subscription price of "THE SPIRIT," which is a high class sporting journal of forty years' standing, is \$5 a year. Address:

EDITOR WILKES'S SPIRIT,
201 William-street, New York.

SEND AT ONCE FOR KNOX'S SMALL FRUIT CATALOGUE.—See page 72.

Thirtieth Thousand!

THE TEMPLE CHOIR. A new Collection of Sacred and Secular Music for Choirs and Singing schools, by **THEO. F. SEWARD, LOWELL MASON, and WILLIAM B. BRADBURY**, which was first published in September last, has already

Reached its Thirtieth Thousand!

Better evidence of its acceptability to the public, that it pleases those who examine it, could not be afforded. IT IS UNQUESTIONABLY THE MOST POPULAR MUSIC BOOK PUBLISHED IN THIS COUNTRY FOR MANY YEARS. It contains much new music by its authors, as well as many other of the most popular composers. Rarely has such variety been included in one volume; its Singing-school Department is very full and complete; and it contains a good number of new glees, for Choir practice, etc. It is very attractive in its Anthem department.

We have never published a book which seemed to give more universal satisfaction. 384 large octavo pages. Price \$1.50.

MASON BROTHERS,

596 Broadway, New York.

MASON & HAMLIN,

KNOX'S NURSERY AT YOUR DOOR.—See page 72.

THE INDEPENDENT.

HENRY C. BOWEN, PUBLISHER,

No. 5 Beckman Street, New York.

THE LARGEST RELIGIOUS WEEKLY IN THE WORLD.

THE CHEAPEST RELIGIOUS WEEKLY IN THE WORLD.

THE LARGEST CIRCULATION IN THE WORLD.

ITS CASH RECEIPTS

the past year larger than ever before.

Its cash receipts the past six months larger than ever before during the corresponding period.

Its cash receipts during the past three months larger than ever before.

It employs the ablest writers in the country.

It pays more for its weekly contributions than any other three religious papers in the country.

It discusses boldly and fearlessly all religions, moral, and political topics.

Its writers are chosen from all the leading Christian denominations.

It aims to be a champion for truth and equity.

It is unsectarian, and earnestly seeks Christian union.

Its prospects for increased usefulness and prosperity were never so great as now.

Its expenditures the coming year will be far greater than ever before.

It will have more special departments than ever before.

It will have more religious news than ever before.

It will take a decided interest in the coming great Presidential contest.

It will earnestly seek the moral, political, and religious interests of the whole people of the nation, irrespective of race, color, or condition.

It will discuss freely all financial matters from a high moral stand-point.

It will insist that every engagement and obligation of the country shall be promptly met with gold.

It will oppose, under present circumstances, any further contraction of the currency.

It will not be in haste to give political power to those who have been rebels.

It will advocate reconstruction on a basis (and that only) of exact and impartial justice.

It will oppose all political maneuvering and machinery calculated to lower the standard of national honor and integrity.

It will consecrate itself with all its power and influence to the great work of moral, political, and religious reform and Christian freedom, the world over.

We ask no subscriptions to support us as a charitable institution.

We ask friends to help us in increasing our circulation and usefulness, if they believe we are doing good, and not otherwise.

We expect to give in every number of the paper through the year reading matter to the extent of any ordinary-sized volume of 300 pages sold at the book-stores.

We expect every subscriber of the paper to say that the money paid for

THE INDEPENDENT

is the best investment of its character he has ever made.

We expect to have a good measure of success in what we shall aim to do. We expect some opposition from rival newspapers, some criticisms for mistakes of judgment, some faint flouting because we are radical, and lots of advice, as usual, from all quarters; but, notwithstanding, we expect to live and thrive, and do more good, perhaps, than ever before.

THE INDEPENDENT.

J. W. WOODWARD,
87 Park Row, New York, Box 330.

300 to 300 per cent. more. See advt. headed "Small Fruits by the Million," in January No.

15 to 30 Days Earlier. Keyes' Early Prolific Tomato. HOVEY & CO.,

Again offer genuine seeds raised by them, of this most valuable Tomato, which has proved from 15 to 30 days earlier than any other kind.

J. S. SEWALL, St. Paul, Minn., says: "It is one month earlier than the Tilden." P. HENDERSON, New York, says: "It ripens its general crop about 15 days earlier than any other variety." L. LINDRETT & SON, Philadelphia, say that "it is a week earlier, and that is enough to make it valuable." A writer in the AMERICAN AGRICULTURIST, from Pa., says each vine produces "10 lbs. per plant, and the Tilden only 25 lbs. That it ripens up its crop in 2 weeks, and is a valuable variety for cold seasons." C. L. DOWNS, Newburgh, N. Y., says "it is at least 10 days earlier than any other variety." E. W. SYLVESTER, Lyons, N. Y., says "it is 10 to 15 days earlier than all others." Wm. REINT, Alton, Ill., "finds it earlier than the Tilden or Brill, and much more productive." J. KING, Duhon, Iowa, says: "It is decidedly the finest fruit of the kind he has yet raised. It is not only 15 to 20 days earlier, but better flavored, an acquisition beyond dispute." THE GARDENERS' CHRONICLE says it is "altogether a first-class variety."

Hundreds of similar testimonials might be added from all parts of the United States.

Single packets of seeds, 25 cts. The trade supplied by the 100 or 1,000. Address S. B. HOVEY & CO., 100 North Market-st., Boston, Mass.

Send for Knox's Seed Catalogue.—See page 71.

SEND AT ONCE FOR KNOX'S SMALL FRUIT CATALOGUE.—See page 73.

TO FARMERS & PLANTERS.

The subscribers offer for sale, 30,000 Tons of Double Red Potatoes, from the Night Soil Road, off, and from the Ashland of New York City, for which they have exclusive contracts for a longer term of years. Price, only Twenty Five Dollars per Ton. The tubers are of the best quality, and as to weight, for weight, as any Sixty or Seventy lb. tubers superintended in market. The results on Corn, Cattle, and Grain, have been astonishing, the past year; maturing crops from 10 days to two weeks earlier, and double the crop. Pamphlets with experience of hundreds of farmers, and every information, will be sent free to any one applying, by letter or otherwise, to THE Lodi MANUFACTURING CO., 60 Courtland-st., New York.

See adv. in Jan. No. "Small Fruits by the Million," and learn how to grow certain and large crops.

BOSTON MARKET CELERY.

Hovey & Co., have the pleasure of offering pure, new seed of this unrivaled Celery, introduced by them to the trade a few years since. It has been often asked why such Celery could be found in Boston, and the answer is, that it is sent by mail for 25 cts. per packet. HOVEY & CO., 33 North Market-st., Boston, Mass.

SEED POTATOES.

Early Goodrich, Gleason, Calico, and Shaker's Fancy, 75 cts. per bushel; \$2 per bushel; \$4.50 per barrel. Two or more kinds sent in a barrel if desired. Cash orders filled in the order received, and the tubers forwarded by Rail or Express as directed; address G. B. TALBOT, Oswego, N. Y.

HARRISON POTATOES delivered per Express per barrel, \$13.00. Early Goodrich, \$1.00. These are my own growing. The yield of the Harrison about 500 bushels to the acre! Goodrich, \$1.00. Address Wm. S. CARPENTER, 156 Bead-st., New York.

For rates for large quantities and for Catalogue containing prices of the other sorts of Vines, including those of the second and third quality, address

PARSONS & CO.,
FLUSHING, near New York.

NEW STRAWBERRIES.

"Charles Downing." This fine variety was raised by J. S. Downer, of Todd Co., Ky., and is considered the best new variety known by such men as Charles Downing, of Newburgh, Prof. Thurber, Horticultural Editor of American Agriculturist, Thos. Meacham, Editor of Gardeners' Monthly, and others. Charles Downing, who fruited this variety last season says it is certainly very promising, and from what I have seen this season, think it will prove an acquisition, and for vigor, productiveness, size, and quality, combined, think it one of the new ones. Price, \$2.00 per 100, \$10.00 per 1,000. The following have been selected from 100 varieties, all are native seedlings, and very promising, except Golden Wonder, which is a foreign variety. Price, \$2.00 per 100, \$10.00 per 1,000.

Gloides Perpetual Vine, everbearing variety, Imported direct from Mr. Goodrich, by me, each \$2.00, \$10.00, sweet, everbearing, \$2.00; \$10.00.
Rogers' Seedling promises to be much more valuable than Wilson, quite as productive and fruit large, bright scarlet, sweet, \$2.00; \$10.00; \$75 per 1,000.
Harrison, a splendid new variety, fine, \$2.00; \$10.00.
Abraham Lincoln, a magnificent berry, \$2.00; \$10.00.
Market, large, productive, very early, \$2.00; \$10.00.
These 6 varieties, each, \$5.00.
Great Rippon, immense size, sweet, \$1.00; \$3.00.
Jucunda, strongly recommended, very large, \$1.00; \$4.00.
Dund's Seedling, better than Jucunda, \$1.00; \$4.00.
Hubbard's Seedling, large, productive, \$1.00; \$4.00.
President, equal to Dr. Naciss in size, \$1.00; \$4.00.
Pearl, Seedling, large, productive, firm, \$1.00; \$5.00.
Negro, large, novel color, nearly black, \$1.00; \$4.00.
Ellis, large, earliest berry known, firm, \$1.00; \$4.00.
Philadelphia, a promising variety, very early, \$1.00; \$4.00.
These nine varieties, one each, \$5.00.
White Alpine, productive, sweet, enough without sugar, \$1.00; \$3.00.
Red Alpine, a great bearer, continuing late, \$1.00; \$3.00.
Dund's Seedling, \$1.50 per 100, \$8 per 1,000. Liberal reduction to the trade. HOOPES, HIO & THOMAS, Cherry Hill Nurseries, West Chester, Pa.

27 An immense crop of Peach Trees at low rates.

HONEY LOCUST.

Best hedge plant in cultivation, hardly, rapid grower, free from disease and insects, and exceedingly thorny. Price for 2-year-old plants, \$1.50 per 100, \$8 per 1,000. Liberal reduction to the trade. HOOPES, HIO & THOMAS, Cherry Hill Nurseries, West Chester, Pa.

THE NEW TOBACCO Latatka, brought from Mount Lebanon by Harvard Taylor, per packet, 25 cents. Address W. N. HALL, Philadelphia, Pa.

GREATEST WONDER OF THE AGE.—Invincible Photographic, a postage of them sent postpaid for 25 cts. Address W. C. WHEAT, 553 Broadway, N. Y. Agents supplied at \$2 per dozen packages.

Short-Hand without a Master, by which the art of taking down Sermons, Lectures, Speeches, Trials, etc., may be attained in a few hours. Fifty-fourth edition, WITH SUPPLEMENT. Price 25 cts. Send orders to O. A. ROBBAC, 122 Nassau-st., New York.

If you want to buy low, see adv. in Jan. number, headed "Small Fruits by the Million." Wholesale List and Terms to Agents sent free.

SEND AT ONCE FOR KNOX'S SMALL FRUIT CATALOGUE.—See page 71.

IMPORTANT TO OWNERS OF STOCK.

THE AMERICAN STOCK JOURNAL

AND
Farmer's and Stock Breeders' Advertiser.

ONLY \$1 PER ANNUM, in ADVANCE.

A First class Monthly Journal, devoted to Farming and Stock Breeding. Each number contains 36 large double-column pages, illustrated with numerous engravings, Spectra Copica trees, for stamp, with list of splendid Premiums to Agents.

HORSE AND CATTLE DOCTOR, FREE.

The Publishers of the AMERICAN STOCK JOURNAL have established a Veterinary Department in the columns of the JOURNAL, which is placed under the charge of a distinguished Veterinary Professor, whose duty it is to receive questions as to the ailments or injuries of all kinds of stock, and to answer in print, in connection with the question, how they should be treated for a cure. These prescriptions are given gratis, and thus every subscriber to the JOURNAL has placed at his command a Veterinary Surgeon, free of charge. Every Farmer and Stock Breeder should subscribe for it.

Sent Free, 3 Mo's. for Nothing.

Every new subscriber for 1868, required by the first of February, will receive the October, November and December numbers of 1867, free, making over 500 large double-column pages of reading matter in the 15 numbers. All for the low price of \$1.00. Address

Something New.

The *Teacher of Penmanship*, published monthly, at Sandusky, Ohio, contains from 30 to 35 different cuts each month, showing "How to Write," "How to Flourish," and "How to Draw." It is recommended by the best penmen and teachers in the country. Subscribers for 1868 receive the Oct. Nov., and Dec. numbers free. Only \$1 a year. If you desire to examine the paper before subscribing, send a card for a sample number; or 10 cts. for a sample number and a beautiful piece of ornamental penmanship; or 25 cts. for two different numbers and a photographic likeness of one of the Presidents of the United States, arranged in an oval form, with Washington in the center, all taken from a large Pen-Drawing, 31 by 54 inches, executed by the publisher.

L. S. THOMPSON, Sandusky, Ohio.

NEW HARDY FORGET-ME-NOT "EMPRESS ELIZABETH."—I have the pleasure of offering for the first time in this country this new and magnificent hybrid, its direct at Sandwich, in Prussia, by the late M. A. Zorica with the old former Forget-me-not. Of the richest azure blue conceivable, it has no rival in color in any other plant. Its chief merit, however, is in its constant bloom, which continues from early May until frost. It is *unavailable* for forcing, and, grown in frames like violets, it blooms all winter. This is one of the most desirable plants ever offered, \$1.50 each, \$15 per dozen. Also, many new Lobelias, Violets, Peonies, Clematis, and other choice plants. New Fuchsias, Verbenas, Salvia, and other bedding plants. Catalogues to any address. Wholesale Catalogues to the trade. Agents wanted.

B. M. WATSON, Old Colony Nurseries, Plymouth, Mass.

Missouri Lands for Sale.

It is a fact that the lands of Missouri, cheap, fertile, and situated in the heart of the Union, furnish an extraordinary opportunity for the people of the Eastern and Northern States to acquire rich, healthy, and good farms and homes, which opportunity never can occur again, so near the great centers of population. The great territory of North Missouri, bounded north by Iowa, east by the Mississippi, south and west by the Missouri River, contains about 25,000 square miles, or sixteen million acres as desirable as any in the Valley of the Mississippi. Through this garden of Missouri, the Hannibal and St. Joseph R. R. extends. Its eastern terminus at Hannibal and Quincy on the Mississippi, and its western at St. Joseph and Kansas City, on the Missouri. Excellent and cheap lands lie along side of its track in alternate sections. Nature here has done much, man but little. The climate, so temperate and healthy, and a virgin soil, capable of producing almost every kind of vegetation, invite settlers from the cold and bleak domains of the North, to settle on our rich and waiting prairies. Slavery has been tried here fifty years, and now Freedom will be tried forever. Let the industrious and enterprising, rich and poor, come and prosper.

Circulars giving full particulars and much valuable information are supplied gratis to all who wish to come, or to circulars to induce their friends to come with them.

A **Sectional Map** showing exact location of all railroad lands is sold at 25 cents. Address

GEO. L. HARRIS, Land Commissioner, Hannibal, Mo.

Field's Pear Culture.....\$1.25

THE AMERICAN

AGRICULTURAL ANNUAL

For 1868.

A YEAR-BOOK

WANTED BY EVERYBODY.

This volume is now ready, and contains much of interest to every agriculturist. Besides the general record of agricultural progress, it has a valuable article on

Factory Dairy Practice,

By GARDNER B. WEEKS, Esq., Secretary of the American Dairymen's Association, in which he discusses the reasons for the best practice and the most approved apparatus, buildings, etc., fully illustrated, and is equally interesting to the practical dairyman and to the novice.

Sewers and Earth Closets

In their relations to Agriculture, by Col. GEO. E. WARING.

Winter Wheat,

Describing, with engravings, new and valuable varieties, by JOSEPH HARRIS and JOHN JOHNSTON;—one upon

Scythes and Cradles,

By JOHN W. DOUGLAS, (fully illustrated;) also articles on **Horse Breaking** and on **Biting Colts**, by SAM'L F. HEADLY, Esq., (illustrated;) on **Recent Progress in Agricultural Science**, by Prof. S. W. JOHNSON; on Commercial Fertilizers, Veterinary Medicine and Jurisprudence, Progress of Invention Affecting Agriculture. Valuable Tables for Farmers and others, etc.

It is intended that the work shall be practical, excellent in the beauty of its illustrations, and in its adaptation to the wants of American Farmers, superior to anything of the kind heretofore published.

In its general features it will be like the *Agricultural Annual* for 1867, containing an Almanac and Calendar, and there will be added a list of dealers in Agricultural Implements, Seeds, etc. Sent post-paid. Price, fancy paper covers, 50 cts.; cloth, 75 cts.

ESTABLISHED 1861.

THE

GREAT AMERICAN
TEA COMPANY

HAVE JUST RECEIVED

TWO FULL CARGOES

OF THE FINEST NEW CROP TEAS.

22,000 HALF CHESTS by ship *Golden State*.
12,000 HALF CHESTS by ship *George Shotton*.

In addition to these large cargoes of Black and Japan Teas, the Company are constantly receiving large invoices of the finest quality of Green Teas from the Myung district of China, which are unrivaled for fineness and delicacy of flavor.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st. The American house in China or Japan makes large profits on their sales or shipments and net of the richest returned merchants in the country have made their immense fortunes through their houses in China.

2d. The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d. The Importer makes a profit of 30 to 50 per cent. in many cases.

4th. On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 100 to 250 packages, at an average profit of about 10 per cent.

5th. The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th. The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th. The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th. The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these ~~eight~~ profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, and with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

Some parties inquire of us how they shall proceed to get up a Club. The answer is simply this: Let each person wishing to join in a Club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper or in our circulars. Write the names, kinds, and amounts plainly on the list as seen in the Club Order published below, and when the Club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation the members can divide equitably among themselves. See club-list in Jan. No. of this paper.

Parties sending Club or other orders for less than thirty dollars had better send Post-office Drafts or money with their orders, to save the expense of collections by express; but larger orders we will forward by express, to collect on delivery.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for Clubs less than \$20.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come directly from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at large prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OO LONG (Black), 70c., 80c., 90c., best \$1 75 lb.
MIXED (Green and Black), 70c., 80c., 90c., best \$1 per lb.
ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.
IMPERIAL (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
YOUNG HYSOON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
GUNPOWDER (Green), \$1.25, best \$1.50 per pound.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of the

GREAT AMERICAN TEA COMPANY,

Evidence After Two Year's Trial.

Treasury Department, }
Fourth Auditor's Office, Washington, Dec. 31, 1867.
GREAT AMERICAN TEA COMPANY.

The accompanying list completes the second year of the existence of this Club, and what I said to you one year ago, I can say again now, and that is, that the Club has been highly gratified with the goods received of your house, and is abundantly satisfied that better articles and lower prices can be obtained there than at any other "house" with which we are acquainted.

Two years' experience has been any criterion for judgment, then the public can rest satisfied that "THE GREAT AMERICAN TEA COMPANY" is no humbug.

Very respectfully yours,

L. CASS CARPENTER.

NOTICES OF THE PRESS.

From the *American Agriculturist*.

THE GREAT AMERICAN TEA COMPANY.—TO QUERIES.—Before admitting their advertisement, we learned that a large number of our clerks and others had for several months been buying their Tea and Coffee from this Company, without its being known who they were, and that they had been highly pleased with their purchases, both as to quality and price, and were all recommending their friends to the same course. As we have published the advertisement for many months, and received no complaints, we conclude "there is no humbug about the establishment."

N. B.—All villages and towns where a large number reside, by clubbing together, can reduce the cost of their Teas and Coffees about one-third (beside the Express charges), by sending directly to "The Great American Tea Company."

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We have no branches, and do not, in any case, authorize the use of our name.

Post-office Orders and Drafts, payable to the order of "Great American Tea Company," Direct letters and orders to the (as below), no more, no less

Important Notice.

The Silver's Patent Broom in which the broom is so elastic that it wears twice as long as the old fashioned tied brooms, sweeps with half the effort, and does not injure the finest carpet, lasts a lifetime, and enables every farmer to make his own broom. As now manufactured, they are with a wrought iron loop and seamless brass cap, they are acknowledged by the 20,000 families who are using them to be the best and most beautiful brooms in America. At the low price we now offer them, every man can make money rapidly. Agents wanted. Also, Combs and State rights for sale at a low figure. Sample sent by mail, prepaid, for \$1.00. Sent for one Circular to

C. A. CLEGG & CO., 28 Cliff-st., New York.

GRAPE VINES.

Iona, Israella, Delaware, and Diana.

My stock which is large, consists chiefly of these our best kinds, but includes all of the leading varieties, including Ives' Seedling.

I offer vines of Iona and Israella of surpassing quality, for Garden and Vineyard, at greatly reduced prices, and cheaper than they can be produced of equal quality under any conceivable circumstances.

See price list and accompanying pamphlet, which gives full account of the performance of the Iona and Israella throughout the country, from their first introduction to the present time, including reports on Iona wine and an account of Iona wine made by Pleasant Valley Wine Co.

Attention to the record of the Iona will be instructive to all who propose to plant vines for wine or for fruit, for family use or for market. Send two-cent stamp for price lists, (wholesale and retail), and also for cuttings.

Iona, (near Peekskill), Westchester Co., N. Y.

GROUP OF CASHMERE OR ANGORA GOATS. — Drawn and Engraved for the American Agriculturist.

Our artist presents us a picturesque group of these silky-haired claimants for public favor, exhibiting at once their fleeces and their propensities. Rocks that goats will not climb, foliage that they will not eat, bark that they will not gnaw, are things hard to find. Still, these propensities to overstep bounds, and do what we would rather they would not, may all be controlled, and their silky fleeces made available to the comfort and pleasure of man. We have been much interested in examining sam-

ples of the fleece of different pure-blooded and grade animals of this breed, if so it may be called, as well as the animals themselves, and are convinced from the diversity of form in the animals, and of fineness of the wool or hair, that there is in the stock great capacity for improvement. These goats impress their characteristics with great certainty and power upon their offspring, when crossed with common goats. The fleece consists of the long, often very fine, silky, hair, and beneath it, very close, fine wool,

which coats the animal in the winter season, and affords a most efficient protection from the cold. By careful breeding, doubtless either of these kinds of fleece may be increased in quantity. The fine Cashmere shawls are made from the soft, fine wool; and though experiments in introducing the fine-haired goats of Cashmere and Thibet into Southern India, to produce this fine fleece, have failed, yet the Cashmires introduced into this country, and their descendants, are said not to deteriorate in this respect.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrolyte plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 18 to Vol. 26, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes, neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, MARCH, 1868.

The coming of this month brings the renewed stir and activity of pressing work, or the preparation for work soon to be undertaken. March is a month of work from New England to Texas. The early part is usually the last of the winter, even in Maine, and over most of the Union farmers are hauling manure, plowing, setting fences, and engaged in other field work before its close. The winter has been a very cold one, up to the time of our going to press. Where much snow has lain, winter grains and fields newly laid down to grass will be benefited, but where the ground has been bare, the deep freezing of the soil, and the exposure of the plants to both cold and heat before it thaws, will be likely to injure both grain and grass, and render the application of some "hand manure" very desirable. After so severe a winter an early spring is anticipated. This is rejoiced in by most farmers, but it is accompanied by many more dangers to fruit trees and field crops than when the cold holds on, and the warm weather, coming later, is subject to few or no great fluctuations of temperature. Loamy or clayey soils should never be worked before they are so thoroughly dried as not to pack before the plow in pasty clods; and no seeds, except those of grass and clover sowed upon winter grain, should be committed to the soil before it is warm and mellow. The error of too early plowing is a common one; everybody wants to be at work in the spring, and no one really feels as if he had begun farming before he smells the fresh earth and sees the long furrows turned. So we get the manures spread and the plows at work, often enough when the plowman's feet are loaded with pounds of sticky clay, and water even stands in the furrows in the low spots. This is all wrong, for thus we burden ourselves with the care of rough, cloddy fields which will hardly get in good tilth before autumn.

Hints about Work.

The most important work any farmer does is to *Lay Plans* for the coming season. If possible think of every important thing, and keep a memorandum of whatever is deemed most essential, and the order in which it should come. In case of necessary absence, the foreman, or any intelligent hand, can go on with the work without any supervision, if a definite plan is made and talked over beforehand. The responsibility thus thrown upon an employee is a stimulus to faithfulness to which an intelligent man almost always responds. The circumstances of different farmers are so various that it is impossible to even hint at a plan of operations applicable to all. With many, a regular system of rotation of crops and manure leaves the principal work of the farmer all planned beforehand. Others decide in the autumn or summer previous, and others still delay until spring even the decision as to what fields to put under plow and where to put their manure. The aimless course is almost sure to bring delays and disappointments, which are readily ascribed to the weather. He who works with a steady aim attains the greater success with much less labor.

Animals.—The maintenance of animals in the stable or in the yards at any time of the year is unnatural, but if they have a great abundance of food and considerable range, the conditions surrounding them approach those they are subject to in the wild state. The amount of food animals exposed to the weather will eat is enormous, and even then they never come out in more than fair condition. We think every spring that it is almost absurd to reiterate our condemnation of farmers who expect, as a matter of course, to have their cattle "spring poor." This condition of a man's stock tells of exposure, lack of good food, and of very serious losses to the farmer himself—losses both of fodder wasted and of cattle injured in their productiveness for the rest of the year, or the rest of their lives.

Working Stock should be fitted for hard labor by increasing their grain and accustoming them gradually to severer demands upon their strength and endurance. Horses' shoulders are apt to gall, and oxen's necks will become sore, if they have done little work during the winter. Look out for such troubles, and bind on wet cloths at night, greasing the spots when the yoke or harness is again put on; but above all have well fitting yokes and harness.

Milk Cows.—Now is the time when rutabagas and mangels will tell on milk production. Cows coming in this month should have succulent food, if possible. Half a bushel, or even a peck, of roots will make a marked difference in the yield of milk, and soon after calving it will pay over and over again to feed oil-cake, from one to three quarts daily. Soak until all the lumps are broken up, and pour the gruel on cut corn stalks or hay.

Cakes.—It is more humane, and better policy besides, to take away the calf, which is to be removed in a few days at farthest, as soon as it is dropped. The cow "takes on" less, and the calf does not mind the separation at all. It will learn to drink from a pail readily. Its diet at first must be its dam's new milk, and then any sweet milk; after the first week it may be changed gradually to skimmed milk with a little oil-meal gruel, or a thin porridge of wheat middlings mingled with it—the quantity of meal being increased as it grows, and that of milk lessened. Scours may usually be checked by a little scalded fine-flour porridge, and constipation by oil-meal. Young calves should be fed four times a day, dividing the periods equally between 5 or 6 o'clock in the morning and 9 or 10 at night. After a few days three times a day will be enough.

Sheep.—Examine the flocks carefully so as to be sure that each sheep gets its share of grain or roots. Give ewes near yearling pens where they are not crowded, littered with short straw, trodden firm. Early lambs are well worth extra care in raising. If found chilled they should be brought to the house and warmed at the fire, or by a warm bath and rubbing. A mild milk punch sometimes has an excellent effect.

Sows.—Breeding sows should be placed isolated, in warm, well littered pens several days before farrowing. Feed roots as a guard against constipation. Raw potatoes are excellent. Charcoal dust with a portion of ashes is uniformly good, and by all means throw them a few fresh sods to root over and chew. A thorough carding is also beneficial, and if a man pets his pigs and really desires to have the young litters in the very best condition, he will do all he can to have the sows not only well fed but in the very best health.

The Everycomb, Card, and Brush, are among the best friends of the farmer and his stock, especially when the animals are shedding their coats. Every horse, young and old, should have a good grooming daily, neat cattle twice, and hogs once a week. Carrots appear to have a remarkable effect upon the coats of cattle and horses. 4 quarts a day is enough, if fed with other roots, grain, bran, or oil-cake.

Buildings, the foundations of which have been disturbed by the frost, should be at once settled to their proper bearings. The present is a good season for outside painting and any repairing.

Manure.—That not intended for immediate use may be forked over and laid up in good-sized heaps, well trodden down, to undergo another fermentation before its use in May or later in the season. Manure that cannot be plowed under, harrowed in, or in some way immediately incorporated with the soil, should not be spread in the field, but left in heaps till it can be. Exposure of a day or two to the sun and wind is often a serious detriment. Top-dressings of animal manure upon grass or grain are of comparatively little avail in the spring. Ashes, plaster, fish manure, guano, bone-dust, etc., if purchased at reasonable rates, are economically applied at this season.

Pick up Stones.—As soon as the surface is thawed the stones will be loosened, and may be picked up and laid in heaps, or at once loaded into wagons or stone-boats, and removed. Many hands make light

work at this business, and half a dozen neighbors' boys may be hired to work for a few days and they will make fun of the job. Mowing land, newly plowed ground, and fields of winter grain, should certainly be gleaned over. A stone which is fast may often be loosened by being struck with another, and those which the boys cannot start will most of them yield to a few blows from a pick.

Farm Roads.—Lay out roads with reference to the future as well as the present wants of the farm. First drain the course, as well as tile drains can do it. This will generally be enough for most cart paths, but roads to be much used at all seasons need more. After draining, level the surface crossways, throwing off the top soil; then make a bed of stones, shallow on the tops of knolls and deeper in the swales and where water will be likely to wash. This will ease the grades, and, being made even and level, crossways, by the use of small stones, should be topped with gravel. Where stones and gravel cannot be had, branches of trees, cedars being especially good, may form the bed, first drained as directed, and covered with earth; this will make a very fair farm road, or even highway.

Fences.—When the ground is loosened by the frost coming out, and the land still too wet to plow, all hands may be set at fence making—resetting posts, renewing rails, staking, bracing, etc. The material needed, and that for new fence, should have been prepared from fall-cut wood during the winter.

Soiling.—Rye will be the first crop ready to cut for soiling. It will respond quickly to a dressing of 100 or 200 pounds of Pervian guano, which, if applied just after the frost leaves the ground, will probably not only add considerably to the crop, but will bring it on notably earlier. If cut so as to allow it to make a second growth, the top-dressing may be given at the time of cutting. Oats, sowed as early as the ground is fit, at the rate of 4 bushels to the acre, are regarded as the best crop to follow fall-sown grains.

Field Work.—Clover and grass seed may be sown on the winter grain. Grain and grass fields may be rolled as soon as the frost is out, thus resetting the roots laid bare by the action of frost and wind, and sinking the small stones. Plowing and harrowing may be done when the ground is dry enough. Potatoes may be planted on warm, early land, using good-sized seed not cut small, and if cut at all left some days to "heal" before planting.

Spring Grains.—It is generally best, north of lat. 40°, to sow in April, but where the ground is warm, and can be thoroughly prepared beforehand, it is well to get all kinds, even peas, in as early as possible. Peas and Oats sown together are an excellent crop for feeding green, or for cutting and curing before ripe enough to shell, to be fed in the straw, or when ripe, to be thrashed, and ground together for feed. It is off early enough to prepare for wheat.

Work for odd times.—The weather and other things will cause unavoidable delays, but few compared with those coming from our own improvidence or thoughtlessness. Always have work for odd times: clear up around the house and barn; work over manure; prepare composts of hen-manure or privy soil for corn, or for top-dressing grain or grass; collect chip dirt where old wood-piles have stood; make ditches to spread the wash of high-ways over the grass; get out pea brush and bean poles, trimming and sharpening them ready for use; and clean out the well and cistern, if necessary.

Prepare for a good Garden, which should be the pride of every farm. Read the hints under Kitchen Garden, and if there is a probability that it will be well looked to, make a hot-bed, and sow lettuce, radishes, early cabbages and cauliflowers, peppers, tomatoes and egg plants. Cucumbers, melons, and squashes, started on pieces of soil, may be removed to the open ground when danger from frost is past.

Hints about Work in Previous Volumes and Numbers will well repay perusal. Especial care is taken not to repeat, except when it is unavoidable. In the previous numbers of the current year subjects touched upon or discussed one month are often quite as appropriately considered in another.

Work in the Horticultural Department.

As we look out upon the snow banks it requires a little faith to put ourselves in a frame of mind to talk about out-door work. With us this has thus far been a grand winter for dormant plants; snow, the best of all mulches, has kept them thus far as well covered as the most careful gardener could wish. Some of our friends in the far southern States write us that our notes are not timely for them. We are well aware of that; neither are they entitled in time for northern Maine and New Hampshire, and are further out of the way for California than for either. It is not practicable to make a calendar that may be followed everywhere, nor even one that will suit a single locality in all seasons.

We long ago discontinued calling these columns a calendar, for the reason that it conveyed a wrong idea. They are intended to be a series of seasonable hints about work, and among other things, condense here in brief what we have not space for in another form.

The time for performing the different operations is well known to those with experience. To the novice we would say, do not be in too great a hurry; after the frost has gone the ground must drain and dry and get in working order. Set out all hardy trees, shrubs, and plants, as soon as the soil can be made fit to receive them. Sow seeds of hardy vegetables, peas, turnips, carrots, cabbage, etc., as soon as the frost is out and the ground can be worked. For tender plants, such as squashes, melons, tomatoes, etc., the time for corn planting, well established in every locality, is the safest guide.

Orchard and Nursery.

One of the first things to be done is to care for *Girdled Trees*, which should be attended to as soon as the injury is discovered. Last month in the "Hints," as well as in the "Basket" on page 48, we gave the manner of treating them.

Order Trees from the nursery at once, if it has not been done. If planting with a view to selling fruit, have a few kinds that are known to succeed in the locality, rather than many but little known ones.

Plant as soon as the soil can be thoroughly prepared. See hints on laying out an orchard, on page 102. If not ready to set the trees as soon as they arrive, unpack and

Tree-in at once, taking care to put the different kinds so that there will be no confusion of names.

Pruning at Planting, and indeed pruning at all, has been much discussed of late, but we have seen nothing to convince us that it is not both advisable and necessary. Cut back at least one-third of the branches of the tree before setting.

Deep Planting is injurious; the tree should be set no lower than it stood in the nursery, allowing for the settling of the newly disturbed soil.

Grafting is not to be done until the buds upon the stock show signs of starting; the cherry and plum should both be grafted very early.

See notes of January and February for other work which may yet be done, especially the instructions in regard to the destruction of insects.

Fruit Garden.

Planting of all kinds is to be done as soon as the soil is in good working order.

Grape Vines that were not pruned last fall should be attended to. In planting young vines cut them back to two or three buds, and then allow but one of these to grow the first year. Much of the failure with grapes is due to planting a long vine and allowing it to grow as it pleases.

Grape Cuttings are best kept out of the soil until it gets thoroughly warmed to some depth.

Current Cuttings, as well as those of the Gooseberry, are to be planted as soon as the ground is ready. In setting these, as well as other cuttings, have the earth well packed around their lower ends, even rammed down firm against them.

Current and Gooseberry Bushes should be trans-

planted as early as the weather will allow, as should

Blackberries and Raspberries; these should be cut back and the growth started from buds at or near the root. If the canes are not cut back some fruit will be borne the present year at the expense of the future welfare of the plants. At the West these fruits are grown in hedges; the plants are set two or three feet apart in the row, and when the Raspberries are a foot high, and the Blackberries two feet, the shoot is pinched, and the side shoots are pinched when they are a foot long. It is said that in this way a very large crop of fruit is obtained, and the plants become self-supporting.

Strawberries.—Set as early as the plants can be had; one foot by 18 inches, or two feet for the large-growing sorts, is the usual distance for garden culture.

Trees in the garden will need the general care indicated in this and previous months under "Orchard."

Kitchen Garden.

If the preparatory work is not well along it will not be because we have not given frequent injunctions to collect manure, procure seeds, repair tools, and consider all the ways and means beforehand.

Preparing the Soil should be done at the earliest practicable moment, but not until it is sufficiently dry. In properly drained gardens the work can be done much earlier than in others. Deep plowing and subsoiling are best for a garden large enough to allow this kind of work. It is advisable to have no trees or bushes in a kitchen garden, or, if they must be there, let them as well as such permanent plants as Rhubarb, Asparagus, etc., be so placed as not to interfere with the free and frequent working of the portion devoted to vegetables. In small gardens deep spading must be resorted to.

Hot-beds are to be made and the seeds sown. It is much more economical of heating material to place it in an excavation; dig a trench 2 feet deep and of convenient size for the sash on hand, drive down stakes and board up the sides of the pit, the boards at the rear being 18 inches and those at the front, (facing the south) 12 inches above the surface; provide cleats extending from side to side for the sashes to run upon, and board up the ends. Fill the trench with fermenting manure, distributing it evenly and beating it down with a fork, or use one-third or more leaves with the manure. Put on 6 inches of rich, light soil and place on the sashes. The bed will become very hot, and when the heat declines below 100° the seeds may be sown. Sow Tomatoes, Peppers, Egg Plants, Early Cabbages, etc., in rows crosswise of the bed and about 4 inches apart. Cover small seeds very lightly.

Cold Frames are much safer for the inexperienced than hot-beds. Place a frame over a well-prepared spot of light, rich soil, put on the sash, and at night cover the sash with mats or shutters. In a few days the soil will become well warmed, when the seeds may be sown the same as in a hot-bed.

Water must be properly given in either hot-beds or cold frames. The water should have the chill removed and be applied from a fine sprinkler. Give air every day when not too cold.

Planting on Sods.—We have often recommended this simple but useful contrivance, but it may be new to some. Get a good bit of pasture sod, and lay it on a board, grass side down; then with a knife cut it into pieces about three inches square. In the earth of these sods the seeds of any of those plants that are not easily transplanted may be sown. Place the whole in a hot-bed or cold frame. Cucumbers and melons seem to delight in this treatment. At the proper time the sods are planted out without disturbing the roots of the plants. It is well to put a half dozen seeds in each, and thin out to two or three. Some hills of early corn and even potatoes, may be had in this way.

Plants in the house may be started in common boxes, or according to hints on page 106.

Cabbage Plants and others that have been wintered in frames must be freely exposed, and generally the sashes may be removed altogether.

Asparagus is to have the litter removed and some

good manure carefully forked into the beds; give a dressing of salt. Sow the seeds early for new plants in rows a foot apart, and make new beds.

Rhubarb needs the same treatment, except the salt; divide old roots and make new beds, setting the portions of root, with a bud in each, 3 or 4 feet apart each way, according to the size of the variety.

Sow Seeds of Beets, Carrots, Spinach, Salsify, Onions, Leek and early Turnips in rows 15 inches apart and Cress and Lettuce in rows a foot apart.

Raidishes may be grown by themselves in rows a foot apart, or be sown between the rows of beets.

Plugs.—Sow some of the early sorts, putting the seeds 3 or 4 inches deep. Dwarfs take little room.

Potatoes.—Plant Early Goodrich or some other good early sorts. See Seed List in "Basket."

Onions.—Sets and potato and top onions are to be planted early, 4 or 5 in. apart in rows a foot apart.

Persnips and Salsify that have remained in the ground over winter should be dug before they grow.

At the South in most localities the tender vegetables may be sown, such as Sweet Corn, Beans, Okra and crops for succession of all the hardier varieties, and Sweet Potatoes may be planted.

Flower Garden and Lawn.—The heavy work of preparing the soil, etc., should be pushed along whenever the weather will allow.

Roads and Paths should be thoroughly done; provide for good drainage and a solid road-bed.

Lawns are too often slighted; as with roads, the best part of the work is out of sight. Deep working, draining, manuring, and leveling, are all requisite to a good lawn. Sow June Grass or Red-top.

Trees of all deciduous kinds may be transplanted. **Hardy Shrubs** are to be transplanted; clumps of these often grow so dense as to need thinning out.

Tender Shrubs, that have been protected during the winter, should not have the covering material removed before the weather becomes settled.

The alternation of warm days and cold nights that occurs in spring is often more injurious to such plants, than the continued cold of winter.

Uncover beds of bulbs, but have a little litter handy to throw over them in case of sudden cold.

Perennials of most kinds that have been 3 or 4 years in a spot do the better for dividing and replanting. See "Everybody's Flowers" on page 101.

Hardy Annuals may be sown as soon as the frost is out, and tender ones started in boxes. See p. 103.

Green and Hot-Houses.—The sun will now do a good part of the heating, and milder weather will allow of freer ventilation.

Propagate a good stock of plants for out-of-door uses. Our large propagators of verbenas and similar bedding plants use very small cuttings of tender and succulent growth. The temperature of the sand in the cutting trench should be from 65° to 75°, and that of the house from 10° to 15° lower.

Insects must be kept down by frequent fumigation with tobacco smoke. A recent writer recommends as a safe way to fumigate frames, to heat a convenient bit of iron to redness, put this in the bottom of a flower-pot, lay a few bits of broken crock over it and put in the tobacco and let it smoulder.

Bulbs for early blooming, may be potted and gradually started into growth. This is the only way to be sure of early Tuberoses, and Lilies may be had in flower much earlier by the same method.

Camellias and such shrubs as are starting their new growth may be pruned. The Camellia may be pruned freely and made to grow in a handsome shape instead of the usual lanky scraggy ones.

Forcing may be done with the Dentzia, and other plants that were potted in autumn for this purpose.

Fuchsias, if not already started, should be brought into a warm place, and be given water. Propagate by cuttings from the young growth. Fuchsias are showy in the border, if not too much exposed to sun.

Cold Grapery.—At the North it is not advisable to start the vines before April, as there is now a fear of the growth being checked by a continued cold spell. Keep the temperature of the house as low as possible by freely opening the doors and ventilators, but avoid sudden changes.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.00 each; Twenty copies and upwards, \$1.00 each. Papers are addressed to each name.

NOBODY

need stop working for premiums, for weeks to come. In past years, many persons have found MARCH the best month in the year to secure subscribers and obtain good premium articles. We have usually sent out more premiums during March and April than in any other month. Those who have hesitated previously, now come to the decision to "TRY THE PAPER FOR A YEAR." The approach of active work in the Field, in the Garden, and around the House, wakes up people to the importance of obtaining all the aid, the hints, and suggestions they can from such a journal as this. The person who most frequently

FAILS

to secure the best return for his labor, is the one who toils with his muscles only, or mainly—the one who despises all "book farming," and keeps down as nearly as possible on a mental level with the ox before his plow. What is this "book farming," which he despises? Why, simply this: A few men act as storekeepers for the great mass of cultivators. They receive and also collect new ideas, hints, and suggestions, about all kinds of work, the best modes of labor, the best implements, the best and most profitable crops, fruit, etc. These are gathered from a wide field, sorted and arranged, and the best selections that can be made are multiplied indefinitely and sent out

TO

every one contributing a small subscription to the general expense. Who would not give a dollar-and-a-half, or a quarter of a cent apiece, to have six hundred fellow-workers call upon him during the year, and each drop a single hint about how he himself manages his work, or how he would advise to do it; what crops he finds best, how he turns them to the most profitable account, and so on.

With six hundred such calls, could any man fail to gather some hints, or have his thoughts turned into some new direction, which would benefit him ten times, or a hundred times the value of a dollar-and-a-half? Well, the *Agriculturist* collects and brings to one's bedside, out of work hours, just such hints and suggestions as he would

GET

from the personal calls of far more than six hundred fellow-workers. Thousands of persons have actually testified that single hints have benefited them hundreds of dollars. Thousands of others would testify the same thing, if called upon. Tens of thousands of others have been benefited by the quickening of thought they have received from reading, without particularly noticing the mental process. Thinking, reading men are, as a class, more successful, more elevated above the brutes, and more happy in their daily work. Those who have not been used to reading about their own business, do not know what they are losing. It is a good, a benevolent work, to persuade them to seek information—to set them to reading and thinking more. Aside from any profit or credit of having a large circulation, we enjoy seeing the number of reading people increased among cultivators.

PREMIUMS

are offered to stimulate our friends to active exertion in hunting up the non-reading people, and urging them to read about their work. Not one in fifty of the cultivators of our country takes and reads any journal devoted to his own business. They read news or political papers, which is all very well,—novels and exciting stories, which is not so well,—but scorn "book farming," or anything, if in

print, that aims to help them work better and more profitably, and to increase their physical comfort. Every person led to read and think more, becomes a better man, more prosperous, and happier, when following the plow or wielding other implements. He becomes more intelligent, and far more contented. We desire

THIS MONTH

to have our readers put forth every possible effort to largely increase the circle of reading, thinking men, women and children all over the country. Politics will rage this year, as never before, but while acting our parts as citizens, let us have the general underdone of improvement going on in all that pertains to the Farm, Garden, and Household. We believe every good citizen will delight to take part in this work in the way of his own sake; yet we very gladly give the good premium articles, such as are noted in the table below, to all who will take part in it. Every one who solicits subscribers to this journal will thus get doubly paid—in the satisfaction of doing a good work, and in the premiums received.

Twenty-six Hundred Persons

on our premium books have lists partially completed. These various lists may all be filled up during March.

Twenty-six Hundred Persons

more, at least, may yet begin and complete new lists, and secure good premiums before the offers close this year.

Try it, Friends.—Try it this month, this week. Even should you not ask or secure a premium, every person you persuade to read will be benefited, and you will, in a few years, receive his thanks, and see him happier.

Table of Premiums and Terms, For Volume 27—(1883).

Open to all—No Competition.

No.	Names of Premium Articles.	Price of Premiums.	Number of Subscribers required to secure.
1	Garden Seeds for a Family (40 kinds)	\$5.00	15
2	Flower Seeds for a Family (100 kinds)	\$5.00	15

May 15.....	231,520	260,092	126,804	69,603	393,194	16,211		

The above table gives the weekly receipts for the five weeks ending February 13th, the total number of all kinds for each week, also the number of each kind for the five weeks, as well as the sum of all kinds for the month. By comparison with the number given for last month, we marked down the decrease in the number of hogs. The slight increase in the number of pigs, as well as the supply quite equal to the demand, and the market has remained brisk. The cold weather that has prevailed enabling retailers to keep fresh meats, buyers have been less anxious for small lots, and but little "padding" has been done, the seller usually disposing of his drove soon after the market became settled, and but few "shorts" remained at the close of each week.

But few pigs were in the market, as will be seen by the following list, which gives the range of prices, average price, and figures for the largest sales:

Jan. 13th	129.25c.	25. 16c.	Largest sales	15 @ 17 1/2
do 29th	116.15c.	15 1/2c.	do	15 @ 15 1/2
do 5th	116.15c.	15 1/2c.	do	15 @ 15 1/2
do 12th	116.15c.	15 1/2c.	do	15 @ 15 1/2
Feb. 5th	116.15c.	15 1/2c.	do	15 @ 15 1/2
do 13th	116.15c.	15 1/2c.	do	15 @ 15 1/2

There were but few prime cattle in market. With a few

exceptions one-quarter of the whole were only what may be rated as first quality; one-half, second quality; and the rest poorly fattened oxen and dry cows which sold low to packers and contractors. Much of this "seawall" beef, it is said, goes to the city charitable institutions, and of course at a high price for such stuff. It would be strange if a market like New York in a term of five weeks did not present some prime animals. Those worthy of special notice were a lot of 10 grade Durhams from Michigan, very heavy and fat; they were too large for retail trade and found a slow market. They were, however, sold at the close of their second day in the market to one of our "fancy butchers" at 20c. per lb., on the actual weight of the dressed quarters. Two steers, also grade Durhams, one of them raised and fattened by the wife of a noted cattle broker, sold for 20c. per lb., or about \$700 for the two; they were really fine animals. A lot of Ayrshires deserve mention because of their great beauty; they were round and plump, dark red, with clean white faces; would dress about 100; cwt. and sold for 14c. per lb. It was considered a good bargain by both parties. The "tops" of this drove, as a general thing, found a ready market at above-quoted prices; while the coarse steers, half-fat oxen and cows found a dull, low market, often remaining over until next day. In January, owing to heavy snow which made transportation uncertain, the yards were filled with poor State cattle, which, in the lack of better stock, sold for more than good sleek steers would bring in February. Therefore, with a better market to choose from, and a steady falling off in price, there has been a decline of at least 12¢ to 20c. per pound since our last report, for the same quality of beef.... **Milk Cows.** These have come to market in numbers equal to the wants of buyers. They usually sold in small lots to city milkmen. State "springers," in good order, brought from \$70 to \$80. Good young cows with calves, from \$80 to \$100. Extra milkers, mostly grades of Ayrshire or Jersey, sold for \$120 to \$150 each. Good cows, however, have been scarce, and but few have come to market. Most of the stock being second quality, sold slowly at from \$55 to \$70; while some poor cows sold as low as \$40. The supply for the week ending Feb. 13th was much greater than the demand, and many remained over to next week.... **Calves.** Veal has been in good demand all the month, and anything in market goes off rapidly at a fair price. Live calves may be quoted from 9c. to 12c. for the animals. A few fat, good-sized extras brought 12c. to 13c. Many have come in dressed without removing the skin. Such "hog-dressed" calves sold from 12c. to 14c., according to age and quality. There have been fewer in market for the past two weeks, and prices range about 1c. higher than in January.... **Sheep.** Prices range from 7c. to 8c. for extra lots. Some few prime lots, very fat, brought 9c.; while the lightest ones sold for 5c. to 6c. per pound. The market has been lively all the month, all qualities finding a ready sale. One lot of 115 head, sold on Feb. 10th, for 9c., are worthy special notice. They were native sheep fed in New Jersey, and averaged 130 pounds each. The pelts from such sheep now sell for about \$2.50 each. One butcher, not finding what he wanted in market, went to Litchfield Co., Conn., and bought some Cotswolds of very large size. He gave 10c. per pound, or about \$20 a head, the sheep averaging 200 pounds each. The increased arrivals for the week ending Feb. 13th so far exceed the demand as to make the market a little dull, and a slight falling off in price for medium lots is the result. The demand, however, is large, and mutton is in request, while beef keeps up to its present high figure.... **Swine.** There has been a gradual falling off in numbers, as will be seen by the figures given above, with a gradual upward tendency in price. Live hogs had a ready sale at from 7c. to 8c. per lb., while with the light supply for the week ending Feb. 13th, some sales reached as high as 8c. per lb. Western dressed have come in largely during the cold weather, and sold for from 9c. to 10c.; while city dressed bring 10c. to 10½c. These quotations are very high, and many packers have stopped operations until there is a falling off in price. They confidently believe the high price will not continue long.

New York State Agricultural Society—Officers for 1888.—At the Annual Meeting, held in Albany, Feb. 12th and 13th, the following officers were elected for one year:—*President*, THOMAS H. FAIR, of New York. *Two Presidents*, for Judicial Districts, 1st, John Haven, of New York; 2nd, Samuel Thorne, of Dutchess; 3d, A. H. Thayer, Jr., of Rensselaer; 4th, Milo Ingelside, of Washington; 5th, Harris Lewis, of Herkimer; 6th, W. M. Ely, of Broome; 7th, H. Ten Eyck Foster, of Seneca; 8th, George A. Moore, of Erie. *Cor. Secretary*, Benj. P. Johnson, of Albany. *Recording Secretary*, Thos. L. Harrison, of St. Lawrence Co. *Treasurer*, Luther H. Tucker, of Albany. *Executive Committee*, chosen at large, Samuel T. Taber, of Queens; J. D. Wing, of New York; Wm. M. Burr, of Madison; A. B. Cornell, of Tompkins; James Geddes, of Oneida; L. D. Mitchell, of Monroe;

B. F. Angel, of Livingston; Richard Church, of Alleghany. (It is understood that the Recording Secretary, Mr. Harrison, will hereafter assist the Corresponding Secretary in the labors of his office, as may be needed.) The question of the location of the next Fair was discussed, and strong claims put in for Rochester and Utica; the decision was referred to the Executive Committee. Further editorial reports of the Annual Meeting reach us too late for the present number.

containing a great variety of items, including many good hints and suggestions which are thrown into smaller type and condensed form, for want of space elsewhere.

How to Remit—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. *Observe, the Registry Fee, as well as postage, must be paid in stamps* at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. *Buy and affix the stamps both for postage and registry, put in the money and seal the letter in the presence of the postmaster, and take his receipt for it.* Letters sent in this way to us are at our risk.

Postage.—To our published terms for the *American Agriculturist*, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. Everywhere in the United States, three cents, each quarter, or twelve cents, yearly, must be pre-paid at the Post-office where the paper is received.

SPECIAL REQUEST.—On page 84, the Publishers have partially set forth the advantages of reading. They are ambitious to reach and beneficially influence as large a circle as possible. To help on the enterprise, we invite all our readers who do not try for the prizes, to favor us with their good words and acts. Suppose each present reader induce at least one more to become a reader during this month. It can be done readily, except in certain towns where every person already takes this journal. While we shall appreciate the response to this request, we feel sure that every additional reader secured will be benefited.

"Please Answer in the Paper" is a request a thousand times made—often by those who omit their address. Our space is too valuable, by far, to write personal letters in. As a rule, only topics interesting to a good many persons can be alluded to in type. Subjects or questions of interest to only one or two persons are answered by letter, when we have time.

Advertisements Earlier, if You Please.—It is necessary that all advertisements be received at this office before the 5th of the month. Three papers received later are left out for want of room, although four extra pages were added to accommodate our customers. Had these been sent a few days earlier, we could have made calculations by which all might have appeared.

In the "Ring."—The Kansas friend whose letter was unanswered, hopes that it is not the case with us, as with the Farmers' Club, that it is necessary to be "in the ring" to be noticed. We cannot answer for the Farmers' Club, but for ourselves we can say that we do not know personally one in a thousand of those to whom we reply. We try to treat all alike, and if any feel that they are neglected, it is from no personal reason, but solely because we have not space for everything that we would like to publish.

The Cornell University.—The "First General Announcement" of the Cornell University informs us that it will be opened on the last Wednesday in September next; examination of candidates for admission to take place on the Monday and Tuesday preceding. The Departments are to be those of Agriculture, the Mechanic Arts, Civil Engineering, Military Engineering and Tactics, Mining and Practical Geology, and History, Social, and Political Science. We cannot give

space to a general sketch of the plan of instruction; those who are interested in this, as well as in the terms of admission, should apply for a copy of the Announcement to Francis M. Finch, Secretary, Ithaca, N. Y.

A New Standard Agricultural Work.—We are gratified to be able now to announce a work in press, by Prof. S. W. Johnson, of Yale College, to which the best labors of many years have been devoted. It treats of the relations of the Plant to the Air, of the Plant to the Soil, and of the Philosophy of Farming in general—Manuring, Feeding, etc. There are very few men in the world who can bring to the labor of preparing such a work greater erudition, better practical views, plain common-sense, or sounder reasoning. Professor Johnson was bred upon a good farm, on the edge of an almost unbroken wilderness, and has a knowledge of nature in her primeval wildness, and of the most "intensive" culture in Europe. A familiarity with European languages, thorough chemical knowledge, great thoroughness, patience, and perseverance, and unusual aptness for teaching, make him just the man for so arduous an undertaking. The work, so far as we have perused the manuscript, is simply written, clear, explicit, and full of facts; it cites authorities freely, and is thorough, progressive—leading the reader from step to step to clear an understanding of agricultural phenomena as has yet been arrived at. The work will be adapted to the use of the general reader, and to be used as a text-book in agricultural and other schools and colleges. It will be published in the course of the season.

What is the Matter with the Mule Team?—The picture on the front page of the February number has caused a great deal of fun and some perplexity to many of the readers of the *Agriculturist*. We can easily imagine the indignation of Scipio Africanus at being represented astride of the off mule, and the "guffaw" of the old army teamster as his quick eye sees what is the matter. We admit also that the mules would feel very uncomfortably and would be hard to keep in the road if they were hitched up and driven in this way. We sincerely hope that neither ourselves nor our artists may again be chagrined at finding, when too late to remedy it, that a drawing had not been reversed when put upon the block. Few persons not familiar with the processes of printing and engraving are aware how the drawings and engravings, as well as the type, look. The drawings appear exactly as the pictures after they are printed do, when seen in a looking-glass. If our friends will hold up the mule picture to a mirror, the driver will be on the right, that is the left or right mule, and all will be correct. The action of the white lead mule is perfectly correct.

Sundry Humbugs.—Please stop sending us money to pay the "5 per cent. cash assessments" on prizes pretended to have been drawn for sundry people by A. A. Kelly, by Clark, Webster & Co., and others of their ilk. (These very kind men draw grand prizes for all their customers. Of course they take all the blanks themselves; and numerous rich men that they are.) Enough cash to constitute a generous fund has been sent us this year. We have returned all such money to the senders without charge, but if it keeps coming we shall have to deduct a "5 per cent. cash assessment" to pay for time, clerk hire, and postage, to say nothing of the risk of being considered swindlers ourselves, if the money chances to miscarry in coming and going. We repeat that all these proposed "prizes" are humbugs. The "\$150 prize" is a so-called certificate for 150 shares in a bogus company, and so of the "\$100," and other prizes. They are not worth a farthing—not one of them,—and every dollar forwarded is an absolute loss to the sender.... The "Gettysburg Asylum Scheme" continues to be advertised—to the profit of the operators and the newspapers. Consistency must be at a discount, when leading journals act like the Daily Tribune of Feb. 6, which in its editorial columns warns the people against this scheme, yet in the same paper publishes a displayed advertisement of the Gettysburg Concert, so called. We dislike to appear to oppose anything even professing to aid our noble soldiers who have become crippled or invalids in their country's service, but such schemes as this Gettysburg affair will in the end do them more harm than good. We have followed our soldiers to the battle field, and when sick and wounded have nursed them night and day in the hospital tents, in the field, and in the woods, for weary weeks and months, and we will gladly contribute farther to furnish homes for them, but we prefer to have them receive the full dollars contributed, and not a cent or two on each dollar, if they get anything of the sums solicited by the Gift Enterprise men. It is high time that all these sympathy-pleading concerns received their quints. Let a bona fide enterprise be started to aid the soldiers, by well-known, reliable men, let it be devoid of all clap trap of enormously over-estimated farms, unsalable jewels, old books and boats, etc., and tenfold more actual money will be received, than will ever come from

the best of these lottery and gift schemes, if we can apply the term *best* to things wholly bad.... Our letters this month contain circulars of thirteen different Lottery and Gift enterprises, of eleven different watch and jewelry ticket schemes, all swindles, and of twelve miscellaneous humbugs, such as honey recipes, oil manufacturers, washing compounds, sewing machines, vine publications and instruments, etc.—in all, just three dozen swindling schemes, the operators of each of which are paying large sums for postage and circulars, for which they are reimbursed by the simple-minded, trusting people.... *Beach, Stephens & Co.* is a new name in the great promise-noting-retained-swindling-army, but is a revamp of an old concern.... *Sloan*, of Manchester, N. H., is one of the most "cheeky" swindlers we have lately met, though he has several near relatives in this city.... Manning's un-natural joint stock affair at Milford is, like all of its class, nothing but a humbug.... A. P. Busscy, formerly of N. Y., east, is now in central N. Y., is so greedy of money that he will even murder if paid a small consideration, and has the impudence to argue in favor of lessening the human race. Pity he and a dozen of his class had only one neck, and the hangman a rope around that neck. We would, for once at least, vote for capital punishment for murderers, despite the interposition of Mr. Greeley.... Since the above was written, the Pennsylvania Legislature has repealed the act by which it has hitherto been indirectly upholding the Gettysburg Asylum Scheme.

The Jerusalem Artichoke.—Mrs. A. N. of Rome, Ga., writes: "I would say a word in favor of the Jerusalem Artichoke. I don't know how it would compare with the food of northern cattle; but here, where the great obstacle in keeping a cow is the difficulty of procuring food, I am convinced it would be a most profitable crop. We only have ground enough to supply our own table, but I always take care to let an artichoke grow in every spare corner, and treat my cow to a bucketful as often as possible. Our soil is not what you would call rich—rather the reverse, but I can always

THE JERUSALEM ARTICHOKE.

take a peck bucket full, sometimes more, from a single plant. They need to stand singly, and two or three feet apart; a cow will eat them raw with avidity, and if they are boiled, mashed, and a little bran, or meal and salt, added, she will scarcely stop for breath till all is gone, and will increase her milk at least a third. As there are few days here that a spade cannot be put into the ground, they need only be taken up as wanted. Another advantage is, they are up with the first breath of spring and you can cut an armful of tender tops for the cow before she can find much other green food, and which she will eat with a relish worth witnessing; even the old leaves they eat in preference to almost anything else in the garden. All the cultivation needed is to keep them from getting too thick; they grow so fast few weeds can contend with them. I think if you could induce every one, at least in the South, that owns a lot of ground and a cow, to plant a good lot of them, they would be very much obliged to you."

Make the Most of Your Land.—Gardening for Profit, by Peter Henderson, is not solely devoted to market gardening, but it tells how to treat a garden of any size in a manner to get the most from the space. No book of the kind has given such general satisfaction. Price \$1.50 by mail.

A New Publishing House, that of Messrs. J. B. Ford & Co., 149 Grand St., has been recently organized in this city. Mr. Ford has been for many years connected with the trade—the past eleven years as manager of the Subscription Department of the Appletons, including the Cyclopaedia, etc. One of the first works to be issued by the new firm will be a Life of Christ, by Rev. Henry Ward Beecher.

Knox's Fruit Farm.—The catalogue of Mr. Knox grows each year more portly, and is full of good things. The sending of plants by mail has long been one of the features of this establishment. We are glad to see that he gives due prominence to that much neglected fruit, the currant. That he is eloquent on the Junco, we need not say, and he makes liberal offers to send it with the *Agriculturist* and other papers.

The Word "Muck."—"Will you oblige a reader by explaining what you mean by the word 'muck'?"—Webster defines muck as "Dung in a moist state, — A mass of decaying vegetable matter," etc.

Worcester says: "A substance, as dung or straw, that is moist or in a fermenting state,—Manure." Swamp muck is a substance familiar to most of our readers. To this substance Webster's second definition is substantially appropriate. "Muck" is applied in the common usage of farmers and gardeners of this country to the decomposing vegetable matter of swamps, including substances of different kinds as peat, rotten leaves, and even the deposits in old mill-ponds, if chiefly vegetable.

Chicken Feed.—"P. T.," Connecticut. We know of nothing better for young chickens and turkeys than hard boiled eggs chopped fine, and fed with cracked corn and wheat. The first few weeks is the most critical time with them, and they need animal food in some form, especially in the early spring, before grubs and insects are plenty. We have fed raw liver, chopped fine, with advantage. A change of food is desirable. Wheat or barley steeped in milk, toasted bread crumbs, and hominy, are excellent. They should be fed as often as five times a day, until they are a month old, and should have access to clean water at all times.

Do You Want to Know?—We are obliged to lump answers to a large number of correspondents in this manner. Do you want to know where to get Seeds and Implements? Consult the advertisements; the large dealers usually keep all kinds of seeds and implements. Do you wish to know all about Hops, Flax, Onions or Tobacco? Get our treatises on these subjects. Do you wish a handy Poultry Book? Get Sammers Domestic Poultry. For condensed directions for Drainage see our *Agricultural Annual* for 1891, and for the best account of Cheese Factories, that for 1893. If you wish to know about new plants, fruits, and vegetables, see the *Horticultural Annual*. Both these *Annals* are full of good things.

Vitality of Seeds.—S. A. Green asks as to the length of time garden seeds will retain their vitality. We can only answer in a general way, as the duration of the germinative power depends very much on the care with which they have been kept. The following is Peter Henderson's arrangement. Onions, Parsnips, and Leeks, should be of the previous season's growth. Good for two years, Beans, Peas, Carrots, Egg Plant, Okra, Salsify, Sweet Herbs; for three years, Asparagus, Endive, Lettuce, Parsley, Spinach and Radish. Those safe for four years, Cabbage, Cauliflower, Celery, and Turnip; from five to ten years, Beets, Cucumber, Melons, Pumpkins, Squash and Tomato.

Peanut Culture.—Several Enquirers. The Peanut needs a light mellow and rather fertile soil. Some throw up ridges as for sweet potatoes, but they are quite as often grown in flat culture. The rows or ridges are laid off three or four feet apart, (the plant spreads a good deal), and the seeds, with the husk removed, are planted two in a place at distances of a foot in the row. When the plants are up, then to one in a place, and supply missing ones by transplanting. The after culture consists in keeping the weeds down and the ground mellow. Do not plant until the ground is warm.

Cranberry Culture.—We answer many inquiries together. 1. We have no evidence that the cultivation of cranberries on upland has been successful on a large scale, though small garden plots have done well. 2. A peat bog or meadow, that can be drained and can be flooded at will, is the most suitable place for a plantation. The bog is drained by deep ditches and an embankment is made to keep the water out, with flood-gates for letting it on when necessary. The land is cleared of brush and tussocks, levelled, and covered with 4 to 6 inches of sand, free from loam or clay. In some localities the ground is naturally sandy and this is not required. When the land can be plowed and harrowed it is so treated. Some prefer to prepare the land thoroughly one season and plant the next; the object being to get rid of all the native weeds and grass as thoroughly as possible. 3. Planting is done in the spring, the plants being set from 18 inches to three feet apart. 4. Plants may be had of dealers who advertise them, or they may be taken from wild beds if they are known to be productive. 5. Cultivation is needed through the summer until the plants cover the ground and choke out the weeds. 6. Fuller's Small Fruit Culturist has a chapter on the Cranberry, and there is a special treatise on the subject by Eastwood.

Root-grafted Trees.—R. Reeves. This is a subject upon which good pomologists differ. This plan of propagation has been openly condemned by at least one horticultural society, while, on the other hand, so good an observer as Warder says: "The theoretical objections to root grafts have yielded to sound philosophy, based on, and supported by, practical observation." For ourselves, we should be satisfied with a thrifty, well-rip-

ened tree, with a well-grown root, no matter how it was produced. Many poor root-grafted trees are sent out; this is not the fault of the method, but of the propagator. The cause of the death of young trees is still obscure.

Sprinkling Jet for Hose Pipe.

Where water is thrown from the common perforated rose jet a difficulty is often found from the filling up of the holes with specks from the water. This is obviated by the contrivance figured. The affair is made of tin or sheet brass. It consists of a tube, slightly conical, 3 or 4

inches long, to slip over the nozzle; to this is soldered, at a slight angle, a triangular piece, one corner being made to embrace the tube at the end. The two sides are bent up to prevent the stream of water from spreading too much. The slight angle at which it is placed causes the stream to strike it near the nozzle, and spread out in a fan shape, while the edge or lip over which the water is spread is also turned up a little to more effectually open the sheet of water. It is easily made by any tinner, and for most uses is superior to the rose jet.

\$300 Wheat Prizes.—Interesting to Wheat Growers in the United States and Canada.

At the suggestion of wheat growers in Western New York, who desired to have special attention called to this subject at the Annual Meeting of the N. Y. State Agricultural Society, Feb. 14th, Mr. Judd, of the *American Agriculturist*, brought the matter before the Executive Committee, and placed \$300 at their disposal for prizes. The Committee accepted the offer with a vote of thanks, and they will announce the prizes for the next Annual Fair, probably in the form below, with perhaps slight variations that may be suggested while making out the official premium list. We call attention to the subject now, and give the preliminaries, that farmers may have an eye to the prizes in preparing for their Spring Wheat Crops, and also in looking after their Winter Wheat now in the ground. The prizes themselves are large, but aside from these, the credit of carrying off the Premium at the hands of the Empire State Society, the largest one in the country, will be worth competing for.

The "Orange Judd Wheat Prizes."

Open to the United States and Canada.

Best Two Barrels of White Winter Wheat.....\$100.

Best Two Barrels of Red Winter Wheat.....\$100.

Best Two Barrels of Spring Wheat.....\$100.

To be exhibited at the next Annual Fair of the New York State Agricultural Society (1898) under the rules and regulations of the Society. The Committee of Award to include at least one experienced, practical miller. Each sample to be accompanied by 100 stalks from the same field, with heads and roots complete, and also by a reliable written statement, properly verified, and confirmed by two credible witnesses, giving the name of the variety and source of the seed; the size of the field, the character of the soil and the crops and manures on the same for four years past; the depth and mode of preparing the ground, and the time and mode of sowing and harvesting; the precise method of selecting and cleaning the samples; and any other particulars that may suggest themselves to the exhibitors.—The written statements to be taken into account in making the award.—The written statements, and the three samples receiving the prizes to be the property of the Society.—All other samples to be sold at auction during the fair, for the benefit of the exhibitors, when desired.

The Flower Garden.—Those who wish a guide to the operations in the flower garden will find Brock's New Book of Flowers the best of the works on this subject. Its directions are plain and practical, being the result of long experience in the cultivation of flowers. Price by mail \$1.75.

Sod Fence Query.—"I. B. S.," of White Hall, Mo., wishes to know from the readers of the *Agriculturist* how long a prairie sod fence will last in Missouri, and the best way to make one. We shall be glad to learn the experience of our Western readers who have used such fence, accompanied by profiles of the fences and ditches, with the most lasting slopes for both.

Grape Vine Literature.—Fuller's *Grape Culturist*, Mohr's *Grape Vine*, My Vineyard at Lakeview, Hunsman's *Grapes and Wine*, are all excellent works at moderate prices—see book list on page 84. Strong's and Mead's works are more expensive. They all differ in some particulars, but either is a safe general guide.

Sweet Herbs.—"Market Gardener," Bloomington, Ill., wishes to know, "whether there would be a ready sale for dried sage, etc., at a fair price." Sweet herbs are raised in the market gardens near New York as a second crop, and are considered a paying one. They are put up in loose bunches and are sold green or dry, according to the season. In this state they are so bulky that it would not pay to send them any great distance. Those brought from distant places come pressed in packages or are ground and put up in tin boxes, and are mainly sold by druggists and grocers. This branch of the business is chiefly in the hands of the Shakers, and we are not acquainted with the many statistics concerning it.

Planting Cuttings.—In the "Notes

FIG. 1—CUTTING TRENCH.

from a neglect of this. A light porous soil around the cutting allows it to dry out, and besides this there is something in the close contact of the earth with the cutting which seems to favor the production of roots. We give from that very practical work, Fuller's Small Fruit Culturist, two illustrations. Figure 1 shows a section of the trench in which the cuttings are to be placed; this is made with the spade, by thrusting it down perpendicularly, and throwing the earth to one side. This gives a trench with a nearly perpendicular wall, against which the cuttings are to be placed. After the cuttings are put in, from two to four inches apart, some soil is thrown in, and pressed down firmly against the base of the cutting by means of the rammer, figure 2. This implement is shaped from a piece of 2-inch plank of convenient length. In its absence, use a bit of board.

FIG. 2.

"Russian Crab."—A pomologist who knows, writes us: "Certain nurserymen or interested parties West, are pushing the Tetofsky apple as the 'Russian Crab' trees, at \$1 each, I hear. It is hardy for the North-west, but no crab whatever; and from several years' trial of it on my soil, it does not compare in general productiveness and value with the Duchess of Oldenburg. Why not sell it under its true name now?"

Planting Orchards.—"G. B. G.," Decatur Co., Ind., asks: "How should an orchard be planted on flat, wet, heavy clay soil, drained only imperfectly by open ditches? It cannot, short of great cost, be well drained." Surface planting is often practised at the West, and is much better than placing the roots in a heavy, damp soil. The roots of the tree are placed upon the surface of the soil, and a broad, low mound of earth heaped over them. In the subsequent working of the orchard, the earth is thrown towards the tree and thus the drainage is made more effectual.

Tan Bark as a Mulch.—J. Whittemore, Broome Co., N. Y., has been told that tan bark used as a mulch will injure the soil, and asks if it is true. Simply used on the surface it will do no injury. If a large quantity of tan bark were worked into a very light soil, it would be a detriment mechanically, rendering an already too open soil still lighter. When decomposed, and it decays very slowly, it makes a good manure.

Trees for a Wet Soil.—"A Young Farmer," asks: "What kind of trees shall I set out on a Western wet marsh for the purpose of making shade for cattle, the marsh not being so wet but it can be mowed with a two-horse mow." The Tamarack or American Larch, the Poplars or Cottonwoods, or any of the tall-growing willows, such as the White or Golden. We have never seen the Weeping Willow answer for this purpose, but have no doubt it would answer admirably. It grows rapidly, makes a fair shade, and is one of the first to leaf out in spring; as it is the last to shed its leaves in autumn.

Grapes in Colorado.—F. H. Dickson says: "Please give us your opinion on grape culture in this Territory. Climate as follows: Frosts not very late in spring, fall from such as Sept. 15 to 15th of October

season very dry, so much so that irrigation is necessary for the raising of most kinds of crops. Soil, all kinds usually found in Illinois or Wisconsin, except that it invariably has more or less alkali in it. The winters as a general thing are mild, with but little snow, and some very high winds. Wild grapes grow here, and I am anxious to try an acre or two of tame grapes, if, in your opinion, they will prosper here. What kinds would you advise me to plant?"—Your soil is not very different from that of parts of Northern Mexico, where we have seen the grape flourishing. If you have no late frosts in spring, and can irrigate, there does not seem to be any good reason why most of our varieties should not succeed. As to the sorts to plant, it must be in great measure an experiment with you, and if no one has done it before, you can not do a better service to Colorado than to make a trial of the leading varieties. We think that the Israelita, which has succeeded so well at the South, should be one of the newer sorts to be tried, but we would advise an experiment with all the leading sorts. Please report.

Dangerous Oils.—In an article in the Household Department, reference is made to a law concerning the sale of oils. It is to be found in Section 29 of Amendments to the Internal Revenue Law, approved March 2, 1867, and reads as follows: "And be it further enacted, that no person shall mix for sale, naphtha and illuminating oils, or shall knowingly sell or offer for sale, such mixture, or shall sell or offer for sale oil made from petroleum for illuminating purposes, inflammable at less than 100 degrees Fahrenheit, and any person so doing shall be held to be guilty of a misdemeanor, and on conviction thereof by indictment or presentment in any court of the United States, having competent jurisdiction, shall be punished by a fine of not less than one hundred dollars nor more than five hundred dollars, and by imprisonment for a term of not less than six months nor more than three years."—If some one who is able to bring a case before a U. S. Court, wishes to do so, he can find subjects enough in every town. Show this law to the man of whom you buy your kerosene—also test the oil as directed elsewhere.

Cleaning Knives and Forks.—Next to a clean plate, clean knives and forks are desirable, but in some respectable families one finds a clean plate, and even a napkin sometimes, where the knives and forks are exceedingly dingy. If knives have become rusty by disuse or carelessness, cover the blades with sweet oil, and after lying a day or two rub them with unsalted lime until the rust disappears. For knives and forks the common scouring brick, freely and strongly applied every day, is very good. This not only improves the appearance of the table, but is a good appetizer, and helps digestion more than the best bitters in the market.

"Wood Hangings."—*Not era in house decoration.*—Being prompted to investigate the "New Wood Hangings," we found ourselves in one of the most beautifully decorated rooms we ever saw. The walls were, so to speak, veneered in panels with choice and brilliant woods of many hues tastefully arranged, and oiled so as to bring out their colors. These were put directly upon the plastered walls, just like paper hangings. We saw the veneers or "wood hangings," as cut from the log, and noticed White wood, Holly, Maple, Beech, Chestnut, Oak, Cherry, Mahogany, and Black Walnut, and were told that the veneers, as soon as cut, were moistened with glycerine, a substance which never dries, and so they are kept moist, tough, and flexible, nift applied to the wall. So far, the test of actual use has been favorable, as we learn. It is said to cost less to cover walls with this than with good paper hangings, and a joint-stock company has been formed to carry on the business.

Ash Receptacles.—Anthony M. Carson, Clark Co., Ohio, writes to the *Agriculturist* describing an ash receptacle called "Hall's Ash-House," which appears to consist of a hopper with a sieve at the bottom, forming the top of the iron-lined, wooden ash-holder, which may be used as a leach tub as well. When the ashes are leached, by rindling four hooks the box may be taken off from the ashes and set up again. The idea seems to be a good one, and such an ash receptacle would not be difficult of construction. Mr. Hall may have a patent for it, but if he does not enable the public to buy it, he must risk people making use of his ideas.

Eggs Kept Fresh 8 Years.—Salt and Lime.—J. Baker, New Haven Co., Ct., has heard that salt and lime will keep eggs sweet a long time—even eight years, and asks for the proportions of the ingredients. We have heard of this mixture being employed, and have used simple lime water, or a very thin milk of lime, with success for a few months. The salt may be, and probably is, a valuable addition. We would make the lime to a

pasty consistency, after a few hours or days thin it to a milky fluid, adding salt enough to make a moderately strong brine, and try the experiment with a few dozen eggs, pouring the mixture over them in a jar that may be kept closed. We should be glad to know how to keep eggs fresh for six months.

A French Slicer.—Those who have visited city restaurants have no doubt been impressed with the skill that could make so small a weight of meat furnish such a great show. A large plate has its surface

FRENCH SLICER.

beautifully covered with slices of a thinness that are the admiration of any but a hungry man. The carving of meats, as well as the equally delicate cutting of the bread, is done with a knife called a French Slicer. For some time we have used one of these as a carving knife upon the table, and though it is not elegant in appearance, it does such excellent work that we think our readers would like to know about it. The engraving represents the shape: it has a broad and very thin blade of most excellent steel, the weight of metal being put in the width of the blade, and not in its thickness. The one we have has a blade 14 inches long, but they are made both longer and shorter. They are kept in the cutlery and furnishing stores.

Soft Water in Cement Cisterns.—The Journal of Chemistry says that washing the cistern over inside with silicate of soda, "soluble glass," will prevent the water becoming hard, and a subscriber records his entire success in following the advice. This is worth knowing; the material is easily obtained in cities.

Making Soap in the Family.—Leaching ashes, boiling lye, and soap making on the good old plan, are tedious, and, on the whole, unprofitable operations. We can far better buy our soap, and use the ashes on the onion bed or elsewhere. But we have found the "Saponifier," of Clifford Pemberton, Pittsburgh, Pa., excellent—so much so that we not only use up refuse grease with it, but buy tallow, and have no trouble in making good soap cheaper than we can buy it.

Pigeons.—Mr. Tegetmeier, the author of the Poultry Book, and editor of the poultry department of the London Field, has recently written a book of 190 pages, royal 8vo., on Pigeons, illustrated by 27 richly colored plates of the most striking varieties, which is published by Geo. Routledge & Son, London, 1888. Few persons who are familiar only with the common blue pigeons of our city and village streets, not to say farmyards, where they are rarely favorites, are aware of the great number of varieties into which the species (*Columba livia*) is so to speak broken up. Our common blue pigeons are very much like the wild Rock Pigeon of Europe, which is said to be the parent of all the domesticated varieties. Not even do barn-yard fowls vary so greatly as pigeons. They have a greater variety of color, of form, of habit, and of flight. The work shows all these peculiarities, and besides being a standard guide both for breeding and for judging of the birds at shows, it is an elegant center-table ornament. For sale at the office of the *American Agriculturist*, or sent by mail for \$5.00.

An Improvement.—We thought our old office at 41 Park Row a very good-looking one, considering that the hurry and bustle of a large, active business makes the best-looking place a scene of confusion. But our "illustrious successors," Messrs. B. K. Bliss & Son, have completely eclipsed all we could do, and old 41 Park Row shines as one of the most beautiful and well-ordered seed establishments in the country. It will pay to drop in, and see the fine display of good seeds and ornamental things to adorn the rural home. The *American Agriculturist* retains an office for subscriptions and the display of books, at the old stand of 41 Park Row.

Cost of Cheese Factories.—"P. G.," of Vermont. The capital needed to start an enterprise of this kind depends upon the number of cows to sustain it. In eight factories in Massachusetts, the cost ranges from \$3,000 to \$8,000. In the report of the American Dairyman's Association the average number of cows to a factory is put at 458, the highest being 1049 and the lowest 110. The better way is to visit a cheese factory in running order, before perfecting your plan. And before building, it will be well to consider if, at the present prices, a butter factory, or one where the making of cheese and butter are united, will not pay better than a cheese factory. The price of butter has been for some time quite high. Our *Agricultural Annual* for 1888 (price 20 cts.) contains an excellent article on Cheese Factories.

"Shakers."—The so-called "Shakers" have one peculiarity that might be copied by everybody. If one is told that a flannel, a pair of stockings, sweet corn, sage, dried pumpkin, apple sauce or brooms, or any such thing, is made or put up by the Shakers, there is no more to be said. The seller knows that he has given it the highest praise, and the buyer knows that it is just what it pretends to be, both in quality and quantity. If every one who sends things to market would be a "Shaker" in these respects, we should have no more "topped off" barrels, baskets and boxes of fruit; five pounds of grapes would not include a half pound of pine wood, very nice pine but dear at 20 cents a pound,—lard would not be one-third water, and soap half anything else but soap. We sometimes expose these little ways of dealers, but the task is great. People do like to be cheated, but the Shakers, so far as we know them, are as much behind the age as was old Sol Gills,—they do business in the old way.

Material for Cellar Walls and Floors.—It is well-nigh impossible to make a cellar dry in the midst of a wet soil. The best place to lay a drain to secure a dry cellar is directly beneath the foundation stones—lay tiles if they can be got, otherwise a small V-shaped drain of small stones. The walls should be laid of stones in a mortar 4 parts lime and 1 part cement, with plenty of clean, sharp sand. Any kind of earth or gravel may be used to fill in between the standing earth and the wall. The best cellar floor is made of a grouting of broken stones spread over the surface; this pounded flat and coated with a cement mortar mixed with coarse gravel, and smoothed down level before it sets. If cellars are wet, deeply laid drains on the up-hill side will usually prove a cure. Shallow drains through the cellar and carried off down the hill would usually be effective.

Fresh Earth for Stabled Animals.—**"H.,"** of Morrisstown, N. J., writes as follows: "From an experience of many years, I am satisfied of the beneficial results from giving stabled animals,—horses, cattle, or swine—what fresh earth they will eat, say twice a week, or oftener. It promotes and regulates their digestion, gives tone to their appetites, prevents disease, keeps their coats in fine condition—promoting their general health. I usually lay in a good supply of thickly cut sods, and throw some into their troughs, twice a week. Let those who have doubts try the experiment, giving the same to part of their stock and withholding from the rest for a few weeks, and their doubts will be removed." All cattle in grazing occasionally pull up a tuft of grass, and eat it, roots, earth, and all. This certainly does no harm, and we are not surprised to learn that in "H.'s" long experience he has found earth to supply a want of the animal economy essential to the highest state of health.

Green Grass and Weeds for Manure.—**Mr. Fortune**, to whom we are indebted for so many new plants from Japan and China, gives the following account of the use of green manures in those countries: "In China, bullocks and buffaloes are employed to plow the land, but in Japan it is prepared by manual labor alone; a pronged fork is employed to dig and break up the soil. Vegetable matter is used in a fresh state for manure, as in China. Women, old men, and children were employed on the edges of the fields and on every hill-side, in cutting grass and weeds for this purpose. These, being scattered over the land and mixed with mud and water, rot in a very short space of time, and afford nourishment to the rice crops. A week or two after this fresh manure is thrown upon the land every trace of it disappears from the surface. It probably goes on decaying for some time underground, thus feeding in a peculiar manner the roots of the paddy with those grasses given off during the process of decomposition."

Lime for Cabbages.—**"Gardener,"** who lives on "sand prairie" land in Illinois and can get no stable manure, wishes to use lime as a substitute on his cabbage fields. Lime is properly no substitute for animal manure, yet it may be, and probably will be, an excellent application for this crop. As a rule, on pretty good land lime alone with good culture will probably insure a fair crop of cabbages. Salt is useful also, and an excellent application is lime slaked with a strong brine.

Fermented Manure.—**"J. S.,"** Mass. The use of heaping up manures in the yard and under the sheds is to give them a chance to ferment. Whatever may be the philosophy of the matter, it is pretty well established that it pays to compost all manures and fork them over once or twice before using. The most valuable constituent of green manures, the nitrogen, is not immediately available to plants. In the compost heap this becomes ammonia, which is plant food, and is diffused through the whole mass; the vegetable fiber is also decomposed and all coarse lumps are broken down. A part of the efficiency of manure depends upon its

fineness. Besides it is often an advantage to mix the manures of all the domestic animals, and make the whole mass as uniform in quality as possible.

Mill-pond Mud.—"Is the mud which has accumulated in an old mill-pond valuable as a top-dressing for grass? Should it be mixed with lime?" There can be no doubt of its value. If it contains many sticks and leaves, partly decayed, it would be well to compost it with lime. Have it ready to apply after the grass is cut.

Transactions of the New York State Agricultural Society for 1866.—This report brings the record of the Society's doings up to April, 1867. It was received towards the close of the year, long after the very important information with which it is replete had ceased to be of interest as news, but simply valuable as matter of record. Such elaborate and thorough trials of implements as the Auburn trial of Mowers and Reapers in 1866, or that of Plows in 1867, excite great interest at the time they take place, but a year and a half afterwards there are very few persons who wish to read, or even to refer to the reports. This delay is now supposed to be unavoidable. We think it is not so, but that if the reports were placed in the hands of some energetic publishing house, to be furnished free or nearly so to the Society, and upon the market while interest in the subjects is still warm, they would benefit ten times the number of people they do now.

This volume is, we believe, the largest ever issued by any American Agricultural Society, being an octavo of 1066 pages. It contains, besides the usual reports of the Society's meetings, fairs, addresses, etc., and the abstract of the reports of the County Societies, and of the American Institute, the report of the entomologist D. Fitch, the report of the Mower and Reaper trial at Auburn, an elaborate exhibition of the Agricultural Statistics of the State, by Dr. Franklin B. Hough, and numerous other papers, valuable not only to the citizens of the State of New York, but to agriculturists everywhere.

Bees in March, by Wm. W. Cary.—*Rye meal to promote early breeding.*—As soon as the weather is warm enough for bees to fly freely, *unbudded* rye meal should be set out in shallow boxes, say six inches deep, in a sheltered place, protected from the wind, where the bees can have free access to it until early blossoms appear. Many colonies of bees are deficient in bee bread; these would not breed to any extent until the appearance of early blossoms, unless supplied with a substitute. Rye meal is the best known. Many complain that they cannot get their bees to work on meal. My method is very easy and simple. On a day when your bees are flying freely, set out your boxes with two quarts or more of meal in each box, then take a small piece of comb with a little honey in one side, hold it to the entrance of a hive until a few bees commence to take the honey, place it in the box directly on the meal—in a short time you will have plenty of bees working on the meal. Water is another important requisite. When not to be obtained near the apiary, supply it; they prefer to take it from a warm, sheltered, sunny spot where straw or something of that nature is thrown out.

Spring Wheat.—**Theo. Gasch, La Fayette, Ind.** There is a great confusion of names of the spring wheats—Club, Fife, Tea, etc., are popular names. The same wheat may be bought in different markets under different names, and various wheats under the same. Unless you have neighbors, good farmers who have clean, plump wheat to sell, send to some seedsmen or dealer in agricultural implements in one of the large Western cities, for samples and prices of spring wheat, then make your choice, order by telegraph and have the wheat come on by the next train. The old Italian Spring, or something bearing its name, has now a reputation at the West. It was discarded or fell into neglect a few years ago.

Wheat—Chess—A \$1000 Offer.—Some still complain because we do not open our columns to a wider discussion of this subject. We have been looking into the matter for more than twenty years past—have studied it in its scientific relations—have received and read thousands of pages of manuscript, pro and con,—have offered prizes, and had men come hundreds of miles with specimens to claim the prizes, and seen them return perfectly satisfied that they had made a mistake. We doubt not that many are honest in their belief that wheat will really produce chess; but we are just as sure that it will not—can not; and while seeking to devote our columns to such topics as will most benefit the largest number of our readers, it does not seem profitable to take up further space on this particular subject. Please allow us the same liberty of judgment in this respect, that we cheerfully accord to others.—We will only add here, that Mr. L. Gore, Chagrin Falls, P. O., Ohio, an old and successful farmer, is fully convinced that wheat will turn in-

to chess, and to show his faith, and, if possible, settle the question, he offers to wager \$1000 that he can produce chess from wheat or rye, or both. His neighbor, Mr. David Robinson, will make affidavit that he has taken a kernel of chess from a wheat stalk, where it certainly grew. Mr. Gore's directions for securing the change are as follows: 1st. Sow rye in spring, and pasture it all summer; the next spring it will yield chess. 2nd. Sow winter wheat, or rye, or both, in June, pasture until December, and let it grow the next season.—If any are disposed to try the question with Mr. Gore, they can correspond with him.—We give his full address above. We have not time to take part in the correspondence, but we advise Mr. G. to look out for his \$1000, if any enterprising man should accept his proposition. Perhaps he could not better use the money for the good of mankind, than to lose it in "settling" this "vexed question." Please excuse us, if we do not publish or answer the next hundred letters that come in about Wheat vs. Chess.

Cob Meal.—"B. D.," Hartford. Our impression is that there is too little nutriment in cobs to pay for grinding. The cobs furnish bulk, but food should be selected that has nourishment in the bulk. If Indian meal is too concentrated, add roots, either cooked or raw, and you will find a gain of flesh and milk.

Poultry Notes and Gleanings.—**POULTRY IN A SMALL ENCLOSURE.**—You can keep a score of hens and rear chickens from them on 500 square yards. If it is not all grass, you will have to supply them with green food. They must have green food and dust.

TO MAKE A HEN SIT IN A STRANGE NEST.—A broody hen may be made to sit in a strange place by being put on her eggs at night, in the dark, and shut down closely. After a day or two she will keep to them.

CAMPFIRE ADMINISTERED TO CURE GAPS.—The dose for a chicken five or six weeks old is a pill of camphor the size of a small garden pea. Where the camphor julep given to them to drink is strong, they seldom require a pill. It is the odor of the camphor that kills the gap-worms; there is no real contact with it, which is impossible, because the parasites are in the windpipe.

HENS EATING EACH OTHER'S FEATHERS.—Spanish fowls are more prone than any to eat each other's feathers, and, like most bad habits, it finds many imitators. There is no doubt it arises in the first place from the lack of some necessary food—something they require at this season of the year. Those that have no access to grass always do it. We believe if they are supplied with a grass run they always discontinue the habit. A good supply of lettuce cures them, and those that are gone to seed are the best for the purpose. If you cannot give your fowls a grass run, let them have large sods of growing grass, cut with plenty of mould, thrown into their pens daily, and supply them with lettuce freely.

American Herd Book, (Short-horn), Vol. VIII.—This invaluable register (edited by Hon. Lewis F. Allen, Buffalo, N. Y.) comes to us with the beginning of the year. It contains the pedigrees of upwards of 1,000 bulls, and a proportionate number of cows of this royal breed. No man can enter upon the breeding of Short-horns with a view to establish a herd of them and to raise animals which shall be a credit to his breeding, without a familiarity with pedigrees, such as can only be gained by the faithful study of these volumes. The editor assures us, in his preface, that he "has always been careful to exclude such pedigrees as had not, on their face, or by accompanying credible documents, a fair evidence of good breeding." Nevertheless he adds: "It is presumed that every cattle breeder and buyer of pure blooded cattle will form his own judgment of the quality of the pedigrees, (of the stock,) he breeds from, or buys, and place such estimate upon their value as he chooses, or his interest may dictate." There is, therefore, the necessity for intelligent study of these pedigrees, to learn which show simply good breeding enough to be admitted, and which *purify* of blood. The work is embellished with a number of lithographic plates and engravings on wood of animals, each filling every point in the scale of absolute perfection of Short-horns so accurately that any one not having implicit faith in the artist, (Mr. Page,) and in the faithfulness of his drawings, might suppose that much of the likeness to the originals had been flattered out. The frontispiece of the volume is a picture of the piece of bas-relief statuary occupying a niche in a tower of the Cathedral of Durham, England, representing a cow and two milkmaids. The cow has a good small Ayshire head, a very straight back and belly, a deep body, full under, and coarse legs and feet. She is very small, as one of the milkmaids is represented as laying her arm over her back. After noticing the exceeding squareness and depth of the body, we look for the inevitable initial (P) in the corner, and, finding it, wonder if the artist has flattered the subject to please the patron saint of the church, or from sheer force of habit.

Coffee a Cure for Scours in Calves.

—Mrs. N. Howard, of North Charleston, N. H., writes: "A subscriber asks for a remedy for scours in calves. I send a simple remedy, namely: Three table-spoonfuls of ground Java coffee, put into milk or in 'slops' given to a cow. This has in several instances cured the scours. Sometimes the second or third dose is required. This is my remedy for calves, and for pigs also, in smaller doses, of course, and it has never failed.

Oil-cake.—What Is Oil-cake?

Inkham, Quincy, Ill.—The common vegetable oils, namely, linseed oil, hemp-seed oil, rape oil, cotton-seed oil, castor oil, olive oil, poppy oil, etc., are all expressed from seeds. This is accomplished by the action of heat and pressure upon the ground seeds. The pulp which is pressed being usually confined in sacking, when the pressure is over, the residue is in the form of flat cakes, quite hard, and impressed with the strands of the sacking. These cakes constitute the oil-cakes of commerce. When "oil-cake" is spoken of, however, that of flax-seed (linseed) is uniformly meant. Other oil-cakes are called by the name of the seed, as rape cake, cotton-seed cake, etc. These commonly used as feed are linseed and cotton-seed cake, and in Europe rape cake. Cotton-seed cake, which is considered safe for feeding, should be from the "decolorized" seed—that is, seed which has had the shell taken off before pressing. All oil-cakes had can be safely fed are very nutritious and fattening, and increase the value of the manure of animals. The castor bean leaves a residue called castor pomace, which, though unfit for feed, is an excellent manure.

Raising Barley.—"J. B. G., Jr., Baltimore.

more. Barley is adapted to soils intermediate between good wheat land and rye land. It follows corn, potatoes, or any root crop well; not other small grains. It is best to sow it on a clover or old grass sod, turned over in the fall, if it is not put in before spring. However, if you can turn the sod over flat this spring, or, better, here it up with a Michigan or double plow—that is, a large plow with a small one cutting the sod simply, set upon the beam like a coultter—you may get a very good crop. Three to five hundred pounds of good bone-dust, or two hundred pounds of guano, well harrowed in, will help out the crop on poor soil. Use about two bushels of seed on ordinary land. Barley is always sowed in the spring.

Chester White Hogs.—E. H. Edkin, of Williamsport, sends us the weight of six piglets of his, 14 months old, the property of A. G. Shiffer, as follows: No. 1, 253 lbs. live, 350 lbs. dressed; No. 2, 355 lbs. live, 530 lbs. dressed; No. 3, 285-322; No. 4, 293-193; No. 5, 430-460; No. 6, 406-476.

Manure Questions and Answers.

—"Line upon line, precept upon precept." We answer questions about manures and their combination, preparation, production, composting, and application, with great pleasure, for on their correct management depends more than on any other one thing the future agricultural prosperity of this nation. There are some statements which we might make every month, and without referring back to see, would say were so made, which nevertheless require to be made again and again in response to earnest inquiries of people who are only just beginning to think practically upon the subject.

Lime and Salt.

—"P. P. S., E. Greenbush.—"What effect will lime and salt have on a compost of muck and yard manure?" You compost yard manure with muck in order that the mixture may ferment, and become fine and homogeneous in its character. The proportions of materials may be determined by your convenience; neither will harm the other. One load of manure to four of dry muck, well mixed and packed, will cause a fermentation; or, to three, or one to two, would often be better. Lime and salt—that is, lime shaken with brine—will do this compost no good, and might better be applied to the field, if needed there. The place for the salt and lime mixture is in simple muck or peat, and so used it will cause a fermentation and breaking down of the lumps, so that the mass will be fine, and fit either to use in a compost with manure or otherwise. Here also the proportions may and should vary from one bushel to one barrel to the extent of two horse loads.

Hen Manure in the Garden.—"H. R. M., Newark, N. J., asks how to use hen manure in an ordinary fruit and vegetable garden. Ans.—Make a good compost with earth, or better with muck, mixing with it, perhaps, well-sieved coal ashes, and adding to it chamber-ly or soap suds enough to moisten, but not wet the mass. After it has fermented, put it where you intend to raise vegetables, and fork it well in, mixing it thoroughly with the soil to a depth of 7 to 10 inches.

Manure for a Shallow Clay Soil.—The same asks: "What manure shall I put on a shallow red clay, on

a hard pan substratum?" Ans.—The material of which bricks are made in the shape of pipe tiles, laid carefully in rows 3½ or 4 feet deep, forming tubes which, if a slight descent be given them, will cause a rapid drying of the soil, a breaking up of the hard pan, access of the roots to new soil, access of air to the lower parts of the soil, and a preparation of the soil, so that any manure will tell.

Line on Clays.—On such a soil as above described, lime will act very favorably. Apply it after spading deeply on the surface. Use less in the spring than in the fall. Half a bushel to the square rod is a very fair dressing—a peck would probably produce a noticeable effect, and in autumn no harm would come from a bushel or more.

Ashes and Hen Manure Compost.—Eugene Hodgson. Take care about the mixture of wood ashes and hen manure. You will lose much ammonia unless the heap is well covered with muck or loamy soil, as well as mixed with the same. If the hen manure constitutes only one-fourth of the compost, it is well mixed and free from lumps, it will not hurt corn if put in the hill.

Good Manure.—There is a great prejudice against this excellent fertilizer. It needs only to be well composted to be exceedingly valuable. Geese eat grass, and drink a great deal of water, but the moisture passes off chiefly through the skin and lungs, and their dung is dry and strong; hence it needs composting.

Broom-corn.—"D. C. C." is raised on any good corn ground. It is best to select that which is not weedy, and especially not overrun with quack or couch grass. Plow in manure, or plant on a sod, calculating to use ashes or some fertilizer in the hills or drills. Harrow thoroughly, and sow the seed at early corn-planting time. The hills or drills should probably be about 3½ feet apart in your latitude, (Mississippi.)

Loose Wagon Tires.—Much expense would be saved at blacksmiths' if the wheels were made of thoroughly seasoned wood, and the felloes were soaked in linseed oil. Steel tires are as economical upon wheels as steel rails upon a railroad.

Timothy Dying Out.

—"H. A. H., of Plainville, Minn., wishes to know why Timothy does not succeed well on their old lands. He says this grass 'succeeds on new lands and thrives in corners and by the roadside, but does not do well on lands from which twelve grain crops have been taken in succession without any manure.' This grass is more easily destroyed by close-fencing or severe freezing than most other. The hard cropping has probably something to do with the failure in this case. The land in Minnesota, we are told, does not produce half the wheat it did in its virgin state, which shows the need of rotation and of manure. It is not strange that Timothy does not succeed on land so constantly cropped with grain. We would recommend a rotation of five or six years; say, 1, corn on the sod and lime, if it can be had; 2, oats or potatoes; 3, wheat with manure, sowing Timothy 8 quarts to the acre, with the wheat, and clover the following Spring on the last snow; 4, clover; 5, Timothy one or two years. The aftermath should not be fed if you wish to continue the land in mowing for a longer term. Deeper plowing also would have a good influence upon the grass as well as other crops.

One-Horse Bone Mill.

—A great need seems to be a cheap, efficient bone mill. The simplest means for crushing ones, next to the sledge hammer, is the stump mill. This consists of two or more beams set upright, having heavy iron or steel "heads," on which they stand in a trough, having a bottom of hard stones or iron plates, and boxed around, so that pieces cannot fly off. The beams are lifted one after another by spurs on an axle; and, when raised perhaps 18 inches or 2 feet, fall with crushing blows. If care were had always to have bones under the stamps, we see no reason why both the stamp-heads and the bed piece might not be made of cast iron. Tre's dictionary, or almost any work on mining, will furnish plates and descriptions of stamp mills.

A Select List of Vegetables.

—Some years we have published a list of vegetable seeds, to aid our readers in making up a selection from the many kinds named in the catalogues. When this has been omitted, we have been reminded of it by a number of subscribers, and we are warranted in supposing that they have found it useful. The lists have heretofore been of such kinds as our own experience has indicated; the present one is made up rather differently. We requested our leading dealers in various parts of the country to furnish us with catalogues, marked in a manner to designate the estimation in which the varieties were held by their customers. We have in this way taken a vote on the vegetables, and though it has been some trouble to tabulate their returns, and get "the sense of the meeting," yet the work has been an interesting one. It is

curious to see how well fixed is the popularity of some varieties—thus the Winningstadt Cabbage is marked on every list, though in different numbers. One selecting from this list will not be likely to go far wrong, but we by no means assume that it comprises all the varieties worth cultivating. There are many novelties offered each year, and the progressive gardener will make a trial of some of them. Then again, an enthusiastic seed grower, like Mr. Gregory, of Marblehead, Mass., has many specialties which we know to be excellent, but as they are not kept everywhere, we do not include them in a general list, but refer for all novelties and specialties to the advertisements and catalogues of the dealers. We do not include those vegetables of which there are but one or two varieties. A list of those vegetables preferred by market gardeners will be found on page 102.

Beans—Early Bush.—Valentine, China, Early 6-weeks. Late Bush.—Refugee, White Kidney, or Royal Dwarf. Peas.—Lima, Horticultural, Wax.

Beets—Bassano, Blood Turnip, Long Blood.

Broccoli—Early Cape, Walcherv.

Cabbage—Early.—Wakefield, Early York, Winningstadt. Late.—Flat Dutch, Stone Mason, Marblehead.

Savoy—Drumhead Savoy.

Cauliflower—Early.—Erfurt, Half Early Paris, Early Paris. Late.—Lenormand, Nonpareil.

Celery—Dwarf White Solid, Boston Market, Seymour's Superb.

Carrot—Early Horn, Long Orange.

Corn—Sweet—Early, Early Dwarf Sugar, sowed Sugar. Late—Stowell's Evergreen, Asylum.

Cucumbers—Early.—Early Russian, White Spined, Cluster. Late.—Long Green Prickly, Long Green Turkey.

Lettuce—Early.—Shiloh, Tennis Ball, Simpson. Late.—India, Butter.

Melons—Musk.—Japan, Nutmeg, Citron. Water.—Mountain Sweet, Mountain Sprout.

Onions—Early.—Yellow Danvers, Early Red, White Portugal. Late.—Wethersfield Rod.

Peas—Earliest.—Carter's First Crop, Dan. O'Rourke, McLean's Advance, Medium Early for General Crop.

Champion of England—Eugenie, Napoleon. Dwarf.—McLean's Little Gem, Bishop's Long Pod, Tom Thumb. Late.—British Queen, Black-eyed Marrowfat.

Peas—Early Goodrich, Ash-leaf Kidney, Early Cottage.

Radishes—Long Scarlet Short-top, French Breakfast, Rose Olive-shaped.

Squashes—Early.—Summer Crook-neck, White and Yellow Scallop. Late.—Inbudd, Boston Marrow, Yokohama.

Tomato—Early.—Smooth Red, Early York, Cook's Favorite. Late.—Tilden, Fejee.

Turnips—Early.—Early Dutch, Red and White-top Strap-leaf. Late.—White French, Robinson's Golden Ball.

—

Buy Reliable Seeds.

—Many do not seem to consider the great importance that attaches to the quality of garden seeds they plant, and why their spring stock at the country store without regard to anything but the fact that they are seeds. Now we know that in many country stores good seeds are sold, and we also know that there is a great deal of trash disposed of, if in doubt as to the quality of the seed on hand, or offered near home, send off to some seedsmen of known reputation, and get the needed supply by mail. All garden seeds, unless in larger quantities than a farmer would want, go cheaply and quickly by mail, and the most remote have equal advantages with those near large dealers.

The Catawba Grape and its Descendants,

Diana and Iona.

BY C. W. GRANT.

[In our notes upon grapes, we some time ago stated that we awarded high praise to the Iona, when we said it was as good as a well ripened Catawba. In discussing this matter with Dr. Grant, we requested him to write out his own views upon the subject, which he has done. An opportunity for a more extended comparison of the Iona with a large number of other grapes, testing them daily for some weeks, led to the statement that we have already made, that in point of quality the Iona was "the best of our native grapes." We give place, though rather late, to Dr. Grant's article, with the remark that we think his position well taken, and that we think it will lead the public to discriminate more closely in the matter of quality, not only with the grape, but with all other fruits.—E.]

We have hitherto taken the Catawba as our standard in measuring the quality of our native grapes, both because it was more extensively known than any other good native kind, and because it possessed an assemblage of qualities that gave an idea of the grape as one of the best of fruits. Although we have never represented it able to

bear a rigid comparison with the best European kinds, we have ranked it far above the Isabella, and still higher above the great mass of those that are named on our lists.

It is a fact well known to all, that our best native kinds up to the Catawba, and including that have been far below the best foreign kinds, both from inherent faults and from the absence of excellence. Norton's Virginia, Elsiburg, and Lenoir, are exceptions, but not of sufficient moment to have a hearing on general grape culture. An analysis of the qualities of the Catawba will exemplify our meaning, and at the same time enable us to show upon what ground American grape culture now stands among ourselves, and in reference to foreign competition.

This is important at the present time, because a standard of quality and value has recently been called into operation by the introduction of new varieties very different from that which obtained no farther back than half a score of years.

We have called the Catawba very good relatively to our own kinds, but it has never been so good that those who know what grapes in perfection are, have not desired better fruit, and made great efforts to obtain it from the vine-growing countries of Europe. And when it was ascertained that the fruit of these kinds could not be produced in the open air, in our climate, expensive houses were erected to obtain it by those who could afford the luxury. We may remark, in passing, that grapes in houses acquire a much larger size than in their own country in the open air, but do not equal them in fine, rich spirit.

The good qualities of the Catawba are abundance of juice that is sweet and agreeable, with some measure of the vinous and refreshing restorative and exhilarating power that belongs to fine, pure wine, but, of course, without its stimulating property. In consequence of these vinous qualities, good Catawba grapes grow upon the liking, and the enjoyment from them increases by use, but their defects also become more and more sensible. In the first place, the skin is always astringent, biting, and unpleasant, and must be carefully rejected. Second, there is always so much of tough, acid unripeness toward the centre, that it would spoil the enjoyment of the whole if it were chewed up together in the manner of eating foreign grapes. They are, in consequence, generally enjoyed by sucking the agreeable portion from the skin and swallowing the centre portion while it remains sugar-coated, all mastication being carefully avoided. This greatly diminishes the enjoyment and the dietetic advantages which are so important. Those who by use are cognizant of the qualities of what may be called perfect grapes, find but little enjoyment in even the best Catawbas, and many avoid their use altogether. Third, even the best portion is always somewhat astringent, from excess of tannic acid, and, besides, is lacking in that pure, rich, and refined spirit that is the crowning glory of perfect grapes, which enables them to make wine of the highest excellence.

Some of these defects appear to be very slight, and scarcely worthy of notice until brought into clear and bold relief by comparison with those that are free from them, when their importance exceeds belief.

The wine of the Catawba was the first of this country's production that gained any extended and enduring reputation. It has the same defects as the grapes, being deficient in richness and fullness, as well as in purity and refinement of flavor, with an excess of acid that renders it rather hard and unpalatable to many tastes. Its peculiar aroma, which is a greatly mitigated foxiness, becomes very moderate under the favoring circumstances of well-ripened fruit, careful selection, and mature age. By some persons this aroma is esteemed an attractive excellence, but with the drinkers of pure, fine Hock wines, which the best Catawba most resembles, it would rank much lower in consequence of it, the effect being oppressive to the faculties, as is the case with all of that impurity that is usually denominated foxiness. It should be understood that the objection to foxiness in grapes or wine is not chiefly from the momentary unpleasantness to the palate, but that it deprives both of their animating property in proportion to its degree; it is, therefore, another name for unwholesomeness, which it is the office of all unpleasant savors and odors to indicate and guard from.

The Draxa ripens much earlier than the Catawba, and has a superiority over it in quality, for fruit and for wine, that has not yet been generally accorded to it. Its introduction would have been an event of much more marked importance, if a misunderstanding or disregard of its peculiarities of habit and requirement had not hindered it in making its way to favor as its merits deserved. It is exceedingly vigorous on generous soils, and has large leaves; consequently its bearing canes should be more sparsely "laid in" than those of the Catawba. It often fails to ripen the fruit of its first bearing, and does not ripen very early until the vines become well established; and when the soil is excessive in richness it does not bear young. It is richer and more spirited than the Catawba, and makes better wine, and when in best condition, it becomes ripe nearly to the centre. The berries are good to

eat by thorough mastication, the skin affording a pleasant, spicy addition to the rich, sugary, vinous juice. It is free from the astringency caused by excess of tannic acid in the Catawba, and has none of its foxiness or acerbity of skin, but it has an odor quite its own, that is unpleasant until the fruit becomes quite ripe, when it is but very slightly perceptible. Its wine is more rich and full-flavored, and less hard and rough than that of the Catawba.

Compactness of bunch should be named as one of its defects, lessening the vinous spirit of the fruit, and sometimes delaying or preventing thoroughness of ripening. It is one of the best late keepers, and is gaining in estimation as it becomes better known. It is generally less disposed to rot than the Catawba, but is not exempt.

The introduction of the Delaware advanced the ideas and the prospects of American grape-culture by an immense stride. Its influence is gaining strength continually by educating the taste, and making manifest the characteristic excellence that belongs to perfect grapes for fruit and for wine, and which places them in rank above other fruits.

In the Delaware there is the high degree of purity, refinement, and rich, vinous spirit that belongs to the best European kinds, and needs no excusing for harshness, astringency, or foxiness. The flavor is full and satisfying, and the severest criticism cannot detect a fault in this respect. It is a grape to be *enjoyed*, although its skins are nearly flavorless, and do not add much to the enjoyment; but they do not detract from it. When in best condition, it is good to the centre, but it is not always thoroughly so, and it is never quite uniformly tender to the centre. The berries are not large—often small—but the skins are so pure and unobjectionable, that they may be made to furnish the large, luscious mouthful that berries of greater size would afford, by taking several at a time and masticating thoroughly.

The defects of the Catawba are brought out clearly by comparison with the Delaware—we should say contrast rather, for that is the relation that these fruits appear to take toward each other.

The wine of Delaware partakes largely of the character of the fruit, as it does also in the two instances previously considered. The wine of the Delaware is unexceptionable in its purity and refinement, and has a peculiar attractive richness that distinguishes it from all other kinds; but it affiliates much more nearly with the warm, rich wines of Burgundy than with the Hocks of Germany. But the quality of the Delaware wine varies very greatly according to the latitude, climate, and condition under which the fruit ripens. In the warm climate of Cincinnati, in favorable seasons, it approaches the character of Hermitage or of Sherry. Towards its northern latitude it becomes nearly a Hock, but always maintains its distinguishing characteristics in purity and refinement of flavor.

We have considered the Delaware in this connection, not because we believe it to be a descendant of the Catawba, but because its affinities are sufficiently with this family to be considered with it in its bearing on the present state and prospects of grape-culture.

The Iona is an advance on the Delaware, and now presents itself for a critical examination of its character and qualities, and a searching inquiry into its history before and since its general dissemination. While it is found to be thoroughly native in habit of vine, it is so different in the essential character of its fruit from that of our native kinds, as represented by the Isabella and Catawba, that wrong and defective ideas prevail extensively concerning it, which it is important for the interests of grape culture to have corrected. In order to have a general clear understanding of these differences, it is necessary that they should be pointed out and accurately defined. They are no less than those that constitute the distinctions between the best foreign kinds and our natives.

The fruit of the Iona has no harshness in its skin, and nothing of foxiness or unpleasantness of aroma, but on the contrary the skin has a spicy vinous flavor, and is good to eat. In ripening, the process is first indicated by a general "clearing" of the berries, as the tendency towards transparency is designated by Europeans, and it does not begin about the circumference and proceed towards the centre, which it never reaches, as is the case with Catawba, Isabella, Diana, etc., but it begins at all parts of the flesh at the same time, and proceeds evenly throughout. The flesh or juicy part has something of meaty consistence, but this is uniform through its whole mass, and yields like delicate jelly to a very slight pressure of the tongue. This being the case, a ripe Iona is all ripe, having no fibre or toughness in any part of it, and it is all good to eat except the seeds, which are few and remarkably small. The juice or flesh, or, as we should rather say, pulp, is all sweet, rich, spirited, and agreeable in flavor, without any degree of harshness or impurity, leaving a peculiarly cleanly and healthful sensation in the mouth that is indicative of its stomachic qualities. A very common idea of "pulp" is that of toughness, which is wrong. The idea of pulp, as used by Europeans in describing grapes, is that of a homoge-

neous, non-fibrous mass, like that of which paper is formed, or that of the finest yielding flesh of a perfectly baked apple. The must or expressed juice of the Iona is as characteristically distinct from that of all others, as is its fruit, being exceedingly sweet and spirited, with a very agreeable wine-like fragrance and flavor.

It will be noted by those who are familiar with the best foreign kinds as grown in their native country, that the foregoing description of the Iona is equally applicable to those, while it is essentially in contrast with those that have heretofore been our best native sorts. The wine of the Iona is even more remarkable than the fruit. Having no unripe, fibrous portions, very little remains after pressing except the skins and seeds, and the juice is all pure and rich to the last drop, and is so free from all acidifying matter that the process of vinification may be as safely conducted in a warm room as in a cellar. The wine is characterized by the extreme fineness, richness of flavor, and fullness of body that belongs to the best German productions, with the same antiferbic and stomachic qualities that are the crowning excellence of the famous Steinberger and Johannberger, with a little more of animation and less of acidity. The reports of our best wine-makers fully confirm the highest expectations that have been entertained as to the wine-making ability of the Iona. A fact that bears strongly in favor of American grape culture is found in the productive habit of the Iona, while all of the excellent kinds of Europe are either moderately or little productive.

The question that has risen and must be answered, practically at least, is: "What rank is the Iona destined to take by its merits in American grape culture?" A proximate solution may be gained by scanning carefully the chief points, and making comparison not only with our own kinds, but with those of Europe also, for the wines of Europe will dominate over those of America until something shall be produced far better in quality than has yet been done by the Catawba or the Isabella, and any of its congeners that are now before the public.

For the production of fruit, which is the part of most general immediate interest, the question is to be decided on domestic considerations only, but the same characteristics of quality will rule. I have endeavored to set forth the chief points by which both public and private considerations of the subject may be more understandingly conducted, so that truth may be elicited, and facts established. The subject is naturally becoming of great importance in general estimation, for what family is there that is not interested in good grapes, such as all have heard of, but few have known? And in wine, too, that is able to aid the sick, and invigorate the weak?

Raising Evergreens from Seed.

BY JOSIAH HOOPES.

[The large number of letters we have had asking the method of raising evergreens from seed indicates a gratifying interest in tree planting. Mr. Hoopes, whose Book of Evergreens is now nearly ready, has at our request furnished the following timely article.]

Seedlings of the evergreens are the most difficult to manage of any that come under the care of the propagator. The seeds abound in an oily, resinous fluid that quickly becomes rancid and destroys the germ, if they are taken from the cones a long time before using. The seeds of most species may be preserved for several years, if allowed to remain in the cones until wanted for planting. Most kinds germinate easily, but the critical season is when the true leaves are being developed, and before the stem becomes firm and woody. At this period the propagator should be on the alert to guard against sudden changes in the atmosphere, or an excess of moisture. *Damping off* is the bane of young evergreen seedlings, and the most experienced hand not unfrequently finds himself at fault to counteract it. A sprinkling of sulphur will destroy the various fungoid growths, so destructive to young evergreens, and dry sand counteracts the effects of too much moisture in the soil.

The fundamental principle in growing Conifers is to plant at the *very earliest moment* in the spring, as no amount of care or forcing by artificial heat will compensate for lost time. Some of the more hardy species will succeed in our

variable climate without resorting to glass coverings; as, for instance, the Arbor Vites, Norway Spruce, Austrian and Scotch Pines, Red Cedar, etc. In the case of these, we select a sheltered spot, and prepare the ground in the preceding autumn, by carefully pulverizing the soil, and incorporating a fair proportion of sharp sand with it, but never using stimulating manures. A coating of ashes is excellent. The following spring, as soon as the soil is in a suitable condition for the operation, shallow drills may be drawn out, and the seeds thinly sown. The soil should then be gently beaten down with the back of the spade, and nothing further will be necessary until the appearance of the seedlings, which soon occurs after a few warm days. We very much question whether any benefit results from deep and frequent cultivation of the soil between the rows, as our own experience has been exactly the reverse. Young evergreens appear to need a compact soil to counteract the tendency to dampen off; and they will survive the first summer more readily if the weeds be pulled without the use of the hoe.

Such species as produce berry-like fruit should have their pulpy covering removed by washing as soon as gathered, and the seeds placed in boxes of sand, or sowed at once in beds where they are to remain. If allowed to become dry they will frequently lie in the ground for two and even three years before germinating. This applies to the Yews, Junipers, and Red Cedar.

With the rarer kinds of evergreens we have used the following contrivance with excellent success. A cold frame is raised above the bed by placing a brick flat on its side, under each corner. After sowing the seeds, the sash should be placed on, and a thin coat of whitewash applied to the glass, to break the direct rays of the sun; after which an occasional slight syringing will supply all needful moisture.

This plan insures a free circulation of air, a moist atmosphere, and partial shade. Sometimes one becomes possessed of a few very rare seeds, upon which he desires to bestow extra pains. In such cases we prepare some turfy, sandy soil, and fill large pots within one or two inches of the rim, and sow the seeds in the autumn, as soon after gathering as possible, and place a pane of glass on the pot. The pots must then be set in a cool green-house or pit, secure from frost. Under the staging is a suitable spot. Towards spring the seed-leaves will commence making their appearance, and moisture must be withheld as much as possible, never, however, allowing the plants to actually suffer. When the young seedlings are well established, and show signs of producing their true leaves, they should at once be pricked out into single pots and placed in a cool, shady place for the remainder of the season. In summing up the requirements of evergreen seedlings in the earliest stages of their growth, we may say that in all cases they must have a free circulation of air, shade, moisture over the plants, but not in the soil, and an early planting.

The South as Desirable Farming Territory—Texas.

BY THOS. APFLECK, WASHINGTON CO., TEXAS.

[We are reluctantly obliged to divide Mr. Affleck's letter and present in this number what he has to say about Texas.—Eds.]

There seems to be much doubt in the North and West, as to whether or not the Southern States offer sufficient inducements to farmers and others to emigrate thither.

Whatever objections were supposed to exist from the presence of slavery there, so far as the condition of the negroes as slaves was concerned, have been removed by the result of the war. The late slave-holders, as a class, are ruined. Nothing is left to them but their lands, with their improvements fast going to wreck. Many are burdened with debt, the total of which, comparatively nothing whilst they held negroes as property, is now overwhelming.

These lands must be sold. They are generally in a form to admit of desirable subdivision. All have more or less of houses which could be easily made habitable for a time, and many have costly mills, gins, etc., upon them; stables, cisterns, etc., which, if not attended to, will fall into decay in another year or two. In many parts of the country, in the track of the armies, the fencing is gone,—but so is the live-stock which ran at large, and made fencing necessary.

As a rule, those lands, requiring but little done to admit of raising a crop, can be purchased for less than the improvements upon them cost. Many of them are under fence of impassable hedges, which could be reclaimed and brought into shape by less labor than fencing with rails would cost. A great breadth of country in Georgia, Alabama, and Mississippi, is one dense coat of that most valuable of all grasses for pasture, *Bermuda grass*, (*Cynodon dactylon*) which will support several times the quantity of stock per acre, when well set and upon soil that suits it, that any other known grass will, though a pest among the crops.

Texas! To do her justice would require a volume! In extent, vast; with soils of every possible quality, generally rich and calcareous; and, especially in the high, rolling, lovely prairie regions, with a climate unsurpassed on the globe, notwithstanding the greatly complained-of "Northerns." Although some portions have been fearfully afflicted this past season by yellow fever, Texas is the healthiest new country ever opened to settlement. I have seen more fatal sickness in one season, at an early day, on the streams of the West, from the Alleghany and Monongahela to the Missouri, than has occurred in all of Texas since her first settlement. Even the valley lands of Texas west of the Brazos, and many of those on the upper Trinity, Brazos, etc., are healthy, and cultivatable by white labor, as are all of the uplands, which, unlike those of most of the other States, whilst they are rich yet do not melt like brown sugar with every heavy rain. The valleys of the West, when irrigated, will be the gardens of the world! To those liable to, or threatened with diseases of the throat and lungs, the climate of the high prairies of Texas is an almost sure specific. No State offers greater facilities for manufacturing, and especially fabrics of wool and of cotton, and cotton yarns.

In Texas, there is abundance of water-power, of fuel, labor, food, etc., etc. And the raw materials, even to the dyes, as Indigo, Madder, wood, and Teazles, are producible at the door.

The greatest of all advantages now offered to the immigrant in the South is, that good lands, which have been long under cultivation, and hence are infinitely more healthy than if newly cleared, or broken up for the first time, can be bought for a song; houses at least sufficiently comfortable for a season; the facilities for a dozen or more of families, old neighbors and friends, settling closely together, with mill, gin-house, etc., sufficient for all; thus affording mutual support, countenance, and assistance, with facilities for schools and churches; and

that in an agreeable climate, where all of the most important staple crops and fruits of the world can be successfully grown.

Where several join in a purchase, time can always be had on a portion of the price, thus leaving more capital in aid of successful cropping.

To those coming South, to farm, I would say—Do not come in the belief that "Ye are the people, and wisdom shall die with you!" Were the sufferings of Job greater than we at the South are now undergoing? I trow not. Be assured that those men who have reclaimed this vast country from the wilderness, who produced crops that were the wealth of this continent, and went farthest of any to maintain the commerce of the entire world, were not absolute fools! Something, even in the present depressed condition, may be learnt from their experience. Seek it, and advise and follow those practices, introducing what you may deem improvements, slowly and prudently. Not a few have failed from pursuing an opposite course.

Many owners of large, improved places in this State are laying them off into small farms and renting to new-comers, who are not prepared to purchase, or deem it best to look around for a season. The usual rent for good land, well located, is one-fourth of the cotton, housed in the seed, and one-third of the other crops, also housed. Many can lend team, implements, cows, etc., or will sell these on time. For men of moderate means, it is best to rent for a year or two.

Sheep-farming is a favorite, profitable, and pleasant pursuit. Wheat growing, market gardening, fruit growing, the grape and wine, lumbering, brick-making—in fact, almost any productive pursuit, well followed, succeeds in Texas.

Capital can find safer and better investment here than anywhere else. It is scarcely possible that anything is likely to more than temporarily check the progress of this great State.

The Determination of Sex in Breeding.

Occasionally enthusiastic breeders have thought that they had secured a means of regulating the production of animals of either sex at will. But a wider application of their rules has so far shown their facts to be remarkable coincidences, rather than proofs of the discovery of a scientific truth. It would often be of very great advantage to the farmer, if he could predetermine the sex of his stock, for there is usually a much larger demand for females than for males; but all the devices employed to invariably secure female offsprings in breeding animals are without any satisfactory results. There is nothing in the researches of science or in the experiments of practical men to throw any light upon this matter. It is a law of universal application that the proportion of the sexes among all animals that pair is about equal, while among polygamous species the females largely preponderate. All the rules which seem to work well in the practice of one breeder determine nothing in the hands of another. Some animals will produce for a long series of years only males, while others will produce only females, but, taking a whole herd and their progeny for a number of years, nothing has yet been done to disturb the proportion of the sexes. Any teachings, then, which profess to overrule this law in nature are to be received with suspicion. Experiments in this direction are not likely to be rewarded with success. Still, statistics are always valuable, and persons who are curious in these matters and conduct experiments should preserve records of their results.

GROUP OF IMPROVED SHORT-HORNS.—DRAWING ENGRAVED FOR THE AMERICAN AGRICULTURIST.—(See next Page.)

Improved Short-horns.

We present a beautiful engraving on another page of a group of Short-horns taken from life.

From time immemorial the counties of Durham and York produced a race of fine, large cattle, the cows being famous as deep milkers. From these sprung the Teeswater breed, and it is from this original stock, grazing in the luxuriant meadows watered by the Tees and its tributaries, that the Short-horns come. The name "Durham," or "Durham Short-horn," was early attached to this breed, but by consent of the principal breeders, it has been dropped and that of Improved Short-horn universally accepted. The breed, as it is, owes its celebrity, in fact its excellence, in a great measure neither to the Tees' pastures, nor to the breeders of Durham—but all England has contributed to the one, and distinguished breeders of various parts of the Kingdom have from time to time increased the other. The characteristics of the Short-horns have doubtless been borne by the stock of the best breeders in the section where they originated for a great number of years, but it was not until towards the close of the last century that they came to have such prominence among cattle breeders as their merits deserved. Early in the present century they were imported into this country, and from that day to the present have gained in favor with all breeders. The benefits which have already accrued to this country from the use of Short-horn bulls upon our common cows are beyond estimate. They have increased the size, rapidity of growth, and fattening qualities of our stock, thus improving the beef and cheapening its production. They have improved our milk stock also in a very marked degree. In breeding for general purposes—beef, milk and labor—wherever the soil is rich and the grazing is fine, we think there is hardly a doubt that Short-horns are the best bulls to use with common stock. Now-a-days the farmer who breeds from either "scrub" (that is "native") or grade bulls is shockingly behind the times, besides being blind to his own interests.

Walks and Talks on the Farm.—No. 51.

McAlister offered me \$14 an acre rent for land to plant corn, provided I would plow it for him. I told him this was more than I should probably get by planting it myself, but that I would not rent because no one who hires land for one crop would cultivate it as thoroughly as it should be. One neglected corn crop will injure land vastly more than the rent comes to. The weeds allowed to go to seed would affect the land for years. Our plan is to sow barley after corn, and wheat after the barley. Look at the barley stubbles, and in five cases out of six you will see them covered with weeds. These weeds frequently reduce the following wheat crop eight or ten bushels per acre. And in this crop alone you lose more than the rent received for the land. But this is not the end of the mischief. The clover is not as good, and when you plow up the land the next time the weeds soon threaten the very existence of the crop. One year's seedling makes seven years' weeding.

"Do you not think you can make \$14 an acre profit on a corn crop?" At present prices, yes. At ordinary prices, no. Thirty bushels of shelled corn per acre is a good average crop in this section, worth, at 75 cents per bushel, \$22.50; corn stalks, \$5.50. Total receipts from the crop, \$28. Preparing the land for the crop, \$5; planting and seed, \$1.50; cultivating three times, twice in a row, both ways, \$5;

hoeing twice, \$3; cutting up the corn, \$1.50; husking and drawing in the corn, \$4; drawing in the stalks, &c., \$1; shelling and drawing to market, \$2. Total, \$23. Profit, \$5.00.

"Farming is a poor business." Yes, poor farming is a very poor business; but good farming is as good a business, at present prices, as I want, and withal as pleasant. A good farmer raises 60 bushels of corn per acre instead of 30 bushels. He doubles the crop and realizes *five times* the profit. His land is cleaner, and he has twice the amount of fodder to feed out, and makes twice the amount of manure, and this doubles his future crops and quadruples his profits. His land is getting richer and richer, while in the other case it will be likely to get poorer and poorer; ditto the farmer, and alas! alas! ditto his family.

"But what is a man to do who is poor and has poor land?" If he has good health, is industrious, economical, and is possessed of a fair share of good common sense, he need have no doubt as to his being able to renovate his farm and improve his own fortune.

Faith in good farming is the first requisite. If this is weak, it will be strengthened by exercise. If you have not faith, act as though you had.

Work hard, but do not be a drudge. A few hours' vigorous labor will accomplish a great deal, and encourage you to continued effort. Be prompt, systematic, cheerful, and enthusiastic. Go to bed early and get up when you wake. But take sleep enough. A man had better be in bed than at the tavern or grocery. Let not friends, even, keep you up late; "manners is manners, but still your club's your club."

"But what has this to do with good farming?" More than chemistry and all the science of the schools. Agriculture is an art and must be followed as such. Science will help—help enormously—but it will never enable us to dispense with industry. Chemistry throws great light on the art of cooking, but a farmer's wife will roast a turkey better than Liebig.

The cities are full of young men—many of them from the country—who are out of employment and are glad to work for enough to pay their board. They could save enough money by working on a farm for a few years, to buy one for themselves. But they think it more respectable to sell pins and measure tape. For my own part, I respect any man who is striving to make an honest living by any kind of manual or mental labor. But I give the preference to agriculture, because it is in itself the main foundation of our national prosperity, and because it calls into exercise the best faculties of our nature. A clergyman can be a farmer without soiling his cloth. As I was coming home to-day a city man asked me to give him a ride. "Do you live on your farm now?" he asked, "and how do you like it?" "Pretty well," I replied. After a few remarks as to the scarcity of water, what good sleighing we had had, and how warm it was to-day, &c., he remarked, "I wonder why you would not be a good man to keep a tavern." It seems that he and a few others had built a tavern somewhere and wanted some one to take charge of it. "If you had a few hundred dollars to buy furniture," he said, "you would get rich out of it." I told him I did not know enough to keep a hotel and that I liked farming. "But," said he, "you could have a farm there, though I have known a good many farmers who went to keeping tavern that soon ran the thing into the ground!"

Now, all this was intended to be very complimentary. In his eyes a tavern-keeper was

considerable of a man, and in return for giving him a ride he wished me to go home with the comforting assurance that there was one man at least who thought I was fitted for something better than a farmer. It is to be feared that I did not thank him with that degree of warmth such kind intentions deserved. He will doubtless conclude that "these farmers are a boorish set; they don't know enough to be polite."

One of the best farmers I ever knew used to say that he never remembered a season of drouth that was not followed by heavy crops the next year. The reason, in his case, doubtless was that he availed himself of the dry weather to cultivate his land thoroughly, and kill weeds, and of course better crops followed. But aside from this it is highly probable that a drouth enriches land by causing more water to rise from the subsoil, and, as it evaporates, the plant food which it contains is left near the surface. The country needs a heavy harvest this year, and we may reasonably hope for it. After the snow goes away the land will turn up superbly. I presume the West will put in an immense area of spring grains and corn, and as the markets of the world are bare, and with the present premium on gold, there is a fair chance for remunerative prices. What our agriculture needs is more capital, but as long as 5-20's bring in 9 per cent, there is little prospect of money being invested in farming operations. We can at all events, however, put in such crops as we do sow or plant in good order, and can subdue the weeds wherever the cultivator can be used. This alone would increase our crops enough to pay all our taxes, high as they are.

The trouble is that nearly every farm needs more or less draining, and till this is done, we lose half the benefit we should otherwise get from manure and good tillage. The system advocated in Draining for Profit, of making a plan of all the draining necessary on a farm, and doing the work at once, is undoubtedly the most economical, but few of us have the necessary capital. Mr. Swan, whose farm adjoins John Johnston's, underdrained in this systematic manner, and the cost was much less than Mr. Johnston's. The farm contains 344 acres. It is high, rolling land, but the ridges are full of springs, the water from which saturates the lower portions. Most people would say that such high land did not need draining, but the crops told a different story. The first year after Mr. Swan bought the farm the wheat yielded only 5 bushels per acre. He then commenced to underdrain, stopping all other operations. He put in only six acres of wheat the first year, and this was on thoroughly drained land. It produced more wheat than he got from forty acres the previous year. He did pretty much all the work in two years. The drains were dug by contract at 12½ cents per rod; laying the tiles and filling the drains with plows cost 3 cents per rod; average cost of tiles and cartage, 13 cents per rod; total cost, 28½ cents per rod. There are over sixty-one miles of underdrains on the farm. The hills proved to be wetter than the valleys, and after the work was done it was found necessary to put an extra drain between the other drains on the hills. They are now about 27 feet apart on the high land and double that distance on the low land.

The drains are from 2½ to 3 feet deep. The whole cost was about \$19 per acre. At the present time it would probably cost from \$25 to \$50. Where a man has the capital it is doubtless best and cheapest to drain the whole farm in this systematic manner, but most of us

must drain a few acres at a time every spring, as we can afford it. What we do should be done well. It is not wise to insist on having the drains four feet deep. The depth must depend on circumstances. A four-foot drain will dry a wider area on each side than a three-foot drain, and white tiles are so high this is quite a point. But the great difficulty in most cases is to get a good outlet the necessary depth, without going on to adjoining farms. And in this case it requires no little diplomacy to induce the neighbors to unite in deepening the main ditch and keeping it clean afterwards. I know two or three cases where a system of drains has been choked up and rendered almost useless from this cause. Till we have a law, somewhat similar to the one in Michigan, compelling the towns to keep the streams and ditches clear, deep underdraining will be an up-hill business. One of the most effective drains I have is not more than 20 inches deep at the outlet. As the drains get up into the higher land they are three feet deep, and tap several springs. Of course I would prefer to have the outlet deeper, and there is 13 feet fall from it to the main stream; but I have to discharge into an open ditch that runs through a neighbor's farm, and as this ditch is not more than 20 inches deep, what can I do? Better have a shallow outlet that is free, than a deep one liable to choke up. Mark you, I am not arguing against deep draining. I believe in it most fully, but as things are, it is useless to insist on four-foot drains in all cases. Make sure of a free outlet, and then go as deep as you can. The spring is the best time to underdrain. The land is not so hard; the men, after the comparatively leisure season of winter, are more vigorous and are less likely to get discouraged when they come to a tough spot; and there will be water enough in the drain to enable you to get a smooth and uniform bottom. The water is decidedly the best level.

I wish we had a good hand machine for sowing clover seed. It would not only do the work more expeditiously, but we should not have to give up the work when the ground was in good order, as now frequently happens, simply because of the wind. When the land has been thoroughly cultivated and is in fine condition, five quarts of clover seed and four quarts of timothy per acre is abundant; but many of our best farmers are becoming more in favor of thicker seeding, and a peck of clover seed per acre is not uncommon, and I have heard of farmers who think it pays to sow even more than this, as the clover is so much finer and of better quality. My own opinion is, that more depends on the land than on the amount of seed. There is said to be over 250,000 seeds of red clover in a pound. If we sow five quarts, or ten pounds, on an acre, we put on 2,500,000 seeds, and as there are 43,560 square feet in an acre, we sow about 57 seeds on each square foot.

In a pound of timothy there are about one million seeds. If we sow four quarts, say 5½ pounds, there would be 126 seeds to a square foot. It is evident that if half these seeds grow, we are in the habit of seeding thick enough. Still, there are so many chances of failure that it is better to sow liberally.

We shall all agree on one point: few of us in the wheat district sow enough land to clover. We sow too much barley and oats as summer crops, to precede wheat. The practice is a profitable one, provided we can make the land rich enough. But we take three cereal crops in succession—corn, barley, (or oats), and wheat. We ought in some way to get in another crop of

clover, or, on heavy land, a summer fallow. If land is clean and rich, we might mow clover the first year, for hay, and the second crop for seed; pasture it the next summer, and then plow it up and sow wheat, and seed it down again. If the land could be top-dressed after taking off the clover seed, or early the next spring, it would give good pasture and add greatly to the wheat crop. And by raising large crops of clover we should be able to make rich manure and thus keep up the land.

"I know what I shall do for the next five years," said an enterprising young farmer of this neighborhood. "I shall put in all the wheat I can. That is what pays. Two or three more crops will pay for the farm. Stock is played out." This is quite a general feeling. We shall rush into grain growing as we did into sheep. And the result will be the same. We shall impoverish our farms, and fail to enrich ourselves. Better be content with sowing a less area, and try to raise heavier crops. This is the true policy.

When Mr. Sheldon, of Geneva, bought his farm eleven years ago, he cut 76 loads of hay the first season. He now pastures three times the stock, cuts between 430 and 440 loads of hay of the very best quality, and *raises quite as much grain.*

John Johnston writes me that he is drawing swamp muck into his sheep and cattle yards, and covering it with litter. Outside his sheep yard there is a low spot into which the liquid from his manure piles runs. He has put 20 loads of muck into it. He says: "I have owned the yard 43 years, and have lost a vast amount of excellent manure from that leak. I could never find muck convenient till this year, and I now draw it 2½ miles. I have got 83 loads home, and if I can get 150 loads this winter and have it heaped up among the yard manures, won't I have a fine lot to apply next autumn?"

If the old gentleman knew that I have thousands of loads of muck within two hundred rods of my horse barn, and that the horse manure, so far this winter has lain in a heap by itself, it's a good Scotch scolding he would give me. "Wont it pay to draw out?" Pay! I guess it would—three times over. "Then why don't you do it?" Why don't you?

Mr. J. says: "Land keeps advancing hereabouts. Mr. Black has sold his farm for over \$150 per acre. Buildings only moderate, and land so hilly that much of it can be plowed only with side-hill plows. I understand the purchaser intends to erect a cheese factory." Willard thinks the cheese business is going to be overdone, and there is some danger of it. Cheese factories are starting up in the wheat sections, and we shall soon be able to export ten times as much cheese as before the war. I mistake the signs of the times, however, if there will not be a vastly greater consumption of cheese at home than formerly.

The true plan, in the grain growing districts at least, will be to combine beef raising with dairying. We shall have grade Short-horn cows that can be readily fattened as soon as they are past their prime as milkers. Having abundance of winter fodder we can adopt this system with advantage to ourselves and to the land.

Why would it not pay us to sow more white clover? True, where the land is well drained and rich enough it springs up itself. And so does red clover. But we do not depend on this. We sow red clover; why not white clover also? For pasture there is nothing superior to it, especially for sheep. There are twice as many

seeds in a pound as of red clover, and a quart per acre, in addition to the usual quantity of clover and timothy seed, would suffice. The expense would be little, and the benefit considerable. But the land must be in fine condition.

It looks now as though men could be hired cheaper this season than last. If we had only more cottages on the farms there would be no trouble in getting good men at reasonable rates. The wages of married men who board themselves are nothing like as high as those of single men who board in the family—taking the cost of boarding into the account. The men are more reliable, and it lessens the work in the house. I have three married men living in houses on the farm, and mean to have another. There is no trouble about finding work enough, even in winter. In many cases we could profitably spend half the winter in drawing muck from the swamps. In hiring, the best way is to give as few perquisites as possible—and as many afterwards as you please. A good man likes to get more than he bargained for, and it will pay to treat him liberally.

Raising rather than Buying Cows.

Two of the best milk farmers of Connecticut said at the meeting of the Board of Agriculture that they bought no cows,—that they could not buy so good as they could raise. We were not a little gratified at hearing this pronounced unqualifiedly, because the contrary practice so commonly prevails. Milk farmers go about to pick up fresh cows in autumn so as to keep their winter supply of milk good, and instead of keeping up their herd from their own calves, either market them as "bobs," or, as they say in the Connecticut valley, "deacon" them, that is, kill and skin them when first dropped. These two farmers, both men of good judgment, experience, and means, cannot afford to buy cows. The question is pertinent,—can any good farmer afford to? We think not. The price at which as good cows as a man may raise should be sold, ought to be so high that one who can raise them cannot afford to buy. It costs as much to raise a poor cow as a good one, and with hay at \$20 per ton that is a good deal. If, however, the cow gives an average of one quart of milk more at a milking for 250 days she will soon make good her extra cost. At 5 cents a quart the amount will be \$12.50 a year.

How many good cows be raised with comparative certainty? This is the question. We answer: first, by never using a common, or grade bull under any circumstances, if within 10 miles of a well bred one of any breed. By using a well bred bull one is sure of something definite and good; otherwise there is no certainty at all. Ayrshire bulls are almost sure to impart to their heifer calves a tendency to become deep milkers; Jersey bulls bring butter makers; Short-horns, fine large cows, which, if allowed to come in young, well fed, and milk secretion especially excited, often make very deep milkers; Devon bulls, if from good milking stock, as is true also with the Short-horns, will be the sires of good milk stock.

Opinions have varied in regard to what kind of cows will give the most milk in proportion to the food consumed. Grade Short-horns have had their advocates, and grade Ayrshires theirs. Few of those who sell milk as the most important article of farm produce have hitherto advocated keeping, still less kept, full-bloods as milk producers. Mr. J. M. Wells, one of the

farmers alluded to, is now (January) milking 19 head, chiefly full-blood Ayrshires, and most of them of his own raising. His product of milk is 200 quarts per day. Mr. H. S. Collins milks Ayrshires, Jerseys, and grades, and is changing his herd as fast as he can raise Ayrshire cows to take the place of others.

Short-horn breeders claim that there is no reason why Short-horns should not be as good milkers as Ayrshires. There is but one reason we know of; that is, they have not been bred for milk alone for many years, and have been bred for beef alone, while both the amount and quality of the milk have been disregarded.

Digging Wells in Sand and Quicksand.

We must have water; springs will sometimes go dry, cisterns give out, wells fail, and the more persistent the flow of water is during trying drouths, the more valuable—the nearer invaluable—becomes the spring or well.

The inquiries published in the last volume of the *Agriculturist* in regard to the best mode of sinking wells in sand have brought out numerous responses, which, now that the frost is coming out of the ground, we give to our readers. The good old way of sinking a wooden base-curb and building up a stone or brick one upon it, is described in slightly varying terms by several correspondents. T. S. Wetherbee, Hammondton, N. J., writes the following:

"Wooden or plank curbs should never be used if they can be avoided, for the water will

to turn off the surface water. One barrel of cement is sufficient for a well thirty or forty feet deep. Use hard bricks, and if the work be well done it will be done cheaply."

Mr. A. F. Damon, of Philadelphia, describes the manner in which the South Americans dig their wells. This is substantially as described by Mr. Wetherbee, except that a rim is nailed upon the base-curb and the bricks laid up inside the rim, and the brick-laying goes on altogether upon the surface, the base-curb being laid flat and the brick-curling laid upon it, at the same time that it is settled into the ground by shoveling out the sand from within the circle.

He says: "Any one wishing to dig a well gives the diameter to a brick-maker, who furnishes him with bricks which are the segments of a cylinder of the required size. This plan was adopted by the Spaniards from the Aborigines, who excelled in pottery work, and whose wells are still in existence." These bricks used to be quite in vogue in this country for wells; but of late, we believe, bricks of the ordinary size and shape (8×4×2 inches) are used, a little more care in laying the latter being requisite to secure an exact circle.

Figure 1 represents the base-curb, somewhat broader than described by Mr. Wetherbee, with the addition of the rim described by Mr. Damon. The circles are made of segments of convenient size, cut from plank and pinned together, breaking joints with treenails. Two thicknesses of 2-inch plank, 8 inches wide, will make a base-curb strong enough to settle evenly in almost every soil, even where stones of considerable size occur. Figure 2 shows a base-curb made of eight pieces of plank, first pinned together, and then trimmed with a saw, axe, or drawing knife, to the proper shape. In laying the bricks, they will require a bit of plank to be laid in for a support, at four points in the circle. Figure 3 shows a 2×2-inch strip saved full of kerfs, in order to bend evenly to make the rim.

Mr. K. Horner, of Ypsilanti, Mich., describes much the same process as Mr. Wetherbee, but says, when the well is dug to the quicksand or to the surface of the water "then, being sure that everything necessary, such as bricks, pails for baling, if necessary, and sufficient help that is not afraid of exercise, are at hand, and all things ready, we begin to move the quicksand about the size of the ring and throw out what we can to advantage, and then put down the ring and begin to lay the brick as fast as possible, and also to dig out the sand from the inside with a long handled shovel, and never let it rest for a moment from the time the first brick is laid till we get down as far as we wish. Keep adding bricks as it goes down. The more brick the more power

Fig. 2.—RIM OF CURB.

there is for the work. In this way we never have any trouble, and all the wood in the water is the ring on which the brick is laid."

CEMENT TILE WELLS.—Precisely the same principle is carried out in the modern cement tile wells, which are greatly approved where the soil and distance to water are adapted to their use. Cement tiles are made of various sizes and shapes for sewers and drains. The one we represent in fig. 3 is of the size sometimes employed for wells; namely, 5 feet long by

2 feet inside diameter. This gives room for a man, (a small man, probably) to stand in it and fill a bucket with sand. We are curious to witness the process, having recently seen one of them in operation, where it was manifestly superior to any other kind of curbing. Where it can be employed it makes the cheapest, simplest and most durable lining that can be devised. The pipes are made with one end narrowed and the other expanded—like a mortise and tenon. Mr. A. E. Smith, of New Haven Co., Ct., writes as follows: "A kind of tile made in sections 3 feet long, 2 feet in diameter, with rabbetted ends to lock together, is used in this vicinity. A hole is dug and a section placed in the ground; then one man gets inside with a scoop and fills the sand into buckets, which are drawn out by a man at the top, using any simple rigging that may suggest itself. As fast as a section is lowered another is put on, and so on until water is obtained, when the well is completed. I believe the cost in this vicinity is \$5.00 per section, and two men will put down in easy digging thirty feet in two days, making a very cheap and durable well. Of course it can only be used where the digging is easy, and I should think was just the thing for a well in quicksand."

Fig. 3.—CEMENT-TILE CURBING.

Home-made Superphosphate from Bones.

A correspondent who makes a superphosphate from broken bones has this formula: "Add to the crushed bones $\frac{1}{4}$ their weight of oil of vitriol and $\frac{1}{4}$ their weight of water. A convenient vessel for mixing the ingredients in an old whale oil cask sawed in two. These casks are usually made of white oak and yellow pine and bound with very stout iron hoops, and last a long time for this purpose. Any wooden vessel or vat made of good timber would answer the purpose. The breaking of bones is work that I always have upon the slate when there is nothing else to be done. I have a spare shed with a hard dirt bottom and a piece of rock in the middle for an anvil. The big bones and hard joints are crushed on this with a heavy steel sledge, and the softer and smaller bones are pounded with a lighter hammer. Of course it costs a good deal to work bones up in this way, and perhaps it would not pay to buy bones at 15 or 20 dollars a ton for this purpose. But I hire boys to pick them up about the neighboring village for 25 cents a barrel or less, and get them of the butcher for about the same price. I use these broken bones very freely in planting trees, and the surplus I work up in the oil casks with the oil of vitriol. I put the finest of the bones into the tub, then pour in the water, and add the oil of vitriol last. I stir the mass with a short pole briskly at the time of mixing and several times a day as long as it remains in the tub. It takes much longer for such coarse bones to dissolve than for bone-dust; if I do not wish to use the fertilizer immediately I allow the mass to remain two or three weeks. I then take out the paste and what of the bones are left, and mix them in the compost heap which has been made for that purpose, if I desire a fertilizer for spreading

Fig. 1.—BASE-CURB OF RECTANGULAR PLANES.

vary in light in the best of wells, and a portion of the curb will at times be exposed to the air. Decay must follow, and on the rise of the water, the bad effects of the rotten wood will soon be perceived both in its taste and healthfulness. Where a stratum of quicksand overlays the water, and the well can be dug, it should be sunk just to the water and the bottom made perfectly smooth. Then cut two circles of board four inches wide, nail them firmly together in such a manner as to make a strong rim; place the circle level in the bottom of the well, lay brick in cement upon the rim and proceed to build the brick work, filling every crevice with cement, if you wish to have a perfect well. Build your wall thus to the height above the surface of the ground that you desire to have depth of water in the well; then sink the whole by digging out directly in the centre. The sand will flow in equally from all sides and the wall will settle evenly. When sunk to the required depth, brick up the well to the desired height above the ground; at all events, sufficiently

broadcast. If I want it for use in the hill or for application to growing plants I dry the paste with sifted coal ashes, dried peat, or any convenient absorbent. Any small pieces of bone left in the fertilizer will be certain to do good after the first year, and that which is fine will benefit the crops immediately. I have never made an accurate experiment to test the value of this fertilizer in comparison with others, but am well satisfied that I get my money back, and at the same time keep the land improving."

We have no doubt this is a very safe way for small farmers to work up all the old bones they can buy at cheap rates. For men of capital it would be safe to buy ground bones, if they can find a pure article, or the phosphatic guanos and make their own superphosphate. We trust any of our readers who make the experiment will report their process of manufacture and the results of the application to the various crops.

Planting Potatoes in March.

Potatoes planted in March are usually subject to cold weather, great dampness of the soil, and a succession of checks before the sprouts reach the surface; and after this the young plant is liable to freezing and thawing and soaking to which it is hardly fair to expose it. It is a grand thing to finish up potato planting early; and it is work which may frequently be done when nothing else can be. If we use choice seed and wish to make it go as far as possible, we are tempted to cut it in single eye pieces for planting. Doing this, with most varieties, we would be likely to lose half the seed,—perhaps more, early planted. It would be otherwise if the planting was to be done in May. Good sized pieces, or medium sized potatoes planted whole, are much the surest to give a good set if planted in March. The cutting should always be done several days before planting, and the heap turned over, or spread thin, to dry somewhat. An incrustation of the starch and juices of the tuber, called healing, takes place which defends the piece against decay. The best results are obtained in planting the potatoes about three inches deep in drills, on dry, gravelly loam.

Experience with Sick Poultry.

Accounts of the successful treatment of well described diseases of poultry, in the present state of our knowledge on this subject, are very welcome. The troubles of a Colorado correspondent have brought the following communication from "A. H. T." of New Haven, Conn.:

"I once had an experience somewhat resembling that of Mr. Page, of Colorado, detailed in the January number. My hens refused their grain, but sought assiduously for drink. On examining them I found their mouths, tongues, and as far down the throat as I could see, covered with thick white spots, a yellow, feculent matter running from the mouth. Each hen that appeared diseased I took from the yard and tied with a string to a brick. Thus she could have nothing but the grass to pick and no water. Not having access to an apothecary's I obtained the rust from an old weather-beaten stove and some iron hoops, and making it into pills of the ordinary size, I gave her three a day. For diet she had fresh meat cooked with a little boiled rice, and for drink, milk with alum dissolved in it. And although I was three weeks curing my worst case, at the end of that time I had the gratification to find my hen singing, and fit to return to the yard.

I will relate another experience of later date. I found two hens on the roost blind, or nearly so, in both eyes, their mouths and bills covered with hard white bunches, a thick coating in their throats, looking just as diphtheria in a human being. They were so far gone I could do nothing for them but to put them out of their misery. One after another was similarly attacked, until about thirty of my hens came under treatment. I lost twelve of this number. My treatment in regard to the iron was the same, but I removed the thick white coating from the mouth by dusting in finely pulverized loaf sugar. I washed their eyes, which in some cases were nearly closed, and sometimes swollen out as large as a small marble, with warm milk and water. In two cases the eye came entirely out, leaving the hens blind on one side. They were fed twice a day with bread cut in narrow strips and put down their throats, as not one could eat or drink of herself. Their drink was milk, warmed, and cayenne pepper put in it. This also had to be poured with a teaspoon into their mouths. The breathing of some of these fowls was so loud and hoarse that it could be heard at a considerable distance. Some of the hens were under treatment for a month, and were sick more or less all the winter. I could find no reason, except that, in the fall, their yard was rendered more damp and cold than usual, by frequent rains. Their food was the same as usual and the water in their trough renewed every morning. This season they have been kept from this yard, and no disease has appeared."

This disease seems very like some forms of Roup, for which we have known active stimulating treatment in the first stages very efficacious. Bread soaked in ale and sprinkled with cayenne pepper, and tincture of iron in their drink, are usually successful remedies.

Fixed Foothold for a Fan-Mill.

Barn floors are somewhat uneven, and fan-mills have not weight enough to stand steadily when turned with a strong arm, to give a forcible blast, so they slide and dance about unless fastened by cleats or otherwise. Mr. Ellwood Hughes of Pottersville, Penn., who thinks farmers reading the *Agriculturist* ought to contribute their good ideas to its columns for the benefit of all, sends us the following description of an attachment to his fan-mill, which he finds of great service:

"A bar of round, $\frac{1}{2}$ -inch iron long enough to turn a short handle above the top of the leg of the fan-mill, has a thread cut at the bottom and passes through a nut fastened at the bottom of the leg. The end of the rod is sharpened to a point so as to take hold in the floor, and the top passes through a staple in the top of the leg. Such a rod should be attached to two of the legs of a fan-mill, so that they may be turned down to take hold in the floor. Thus the mill will retain its place while in use and stand

FIG. 2.

FIG. 1.—FIXED FOOT FOR FAN-MILL.

level, no matter how uneven the floor. When one has done using the mill the rods may be run up, and then the mill will slide smoothly over the floor." Figure 1 shows a portion of the fan-mill with the rod attached, and fig. 2 gives the screw at the lower end of the rod with the nut.

A Handy and Powerful Lever.

In working in soft ground, whether at pulling stumps or moving stones, the great want is a firm place to set the lever. We exhibit in the accompanying engraving a lever, which requires a very simple base, and if rigged with a pulley, or "block and tackle," as shown, may exert a great lifting power. For such lifts a crooked lever has many advantages. We witnessed, a short time since, the operation of such an one, and were struck with its utility. The ring to which the powerful inch-iron hook is attached should perhaps pass through the bar closer to the inner angle than is represented. It might equally well be made so as to slip over the bar and hold in a notch on the inner side. Such a lever may be seven to nine feet long, and made of oak or hickory. It may be operated by hand, by attaching the upper end of the rope to a stump and pulling down upon the lower end; or by horses or cattle, by fixing the lower end and carrying the upper one off to where the team may be conveniently and efficiently used.

HANDY LEVER.

Flavor and Firmness of Texture in Cheese.

BY T. D. CURTIS.

The chief complaint for the last two years against American cheese in foreign markets—and, indeed, against cheese everywhere—is *bad flavor*. This, more than any other subject, occupied the attention of the American Dairymen's Association, at its late Convention, in Utica.

To achieve the best results the cows must give rich, sweet milk. They must be kept healthy and hearty, during the winter, on good wholesome food and pure water, and in clean, well-ventilated stables. By keeping the cows healthy, we avoid beginning the season with a flow of thin or diseased milk. During the season of pasturing, the cows should feed on dry upland pastures, free from all offensive herbage, with access to pure water. They should be milked in a clean place in a cleanly manner, the milk carefully strained, and deprived of its animal heat as soon as possible, and be constantly exposed to the open air. The "milk things" should all be made of tin, and washed, scrubbed, and aired thoroughly, every day. If carried to a factory, the milk should be protected from the influence of the sun's rays falling on the can by having some kind of awning stretched over the wagon. Then, after the milk producer has done his part of the work well, he has a right to demand satisfactory results from the cheesemaker, in whom the most scrupulous neatness is no less a virtue than a duty and a necessity.

The milk, pure, sweet, clean and cool, should be heated rather quickly, but evenly, to 82° in warm weather, and 86° in cool weather. The coloring, which should be selected for its fineness and purity, rather than for its cheapness, is then added, and after this sufficient prepared rennet, (thoroughly incorporating it with the mass,) to begin coagulation in ten to fifteen minutes, and form a firm curd in half an hour to an hour, gently agitating the milk until it begins to thicken. The rennets should be taken from healthy calves, not less than three or four days old, cleaned by wiping and picking instead of washing, thoroughly rubbed with the purest salt outside and in, and packed in stone jars—never in wood. They should be prepared for use by soaking and rubbing in whey, first boiled and skimmed, and the preparation carefully strained into a clean stone jar.

As soon as the curd will break square and clean across the finger, the cutting should begin. The knife recently invented for cutting the curd horizontally should be first used; and then the curd should be cut perpendicularly with a gang of blades standing not over a quarter of an inch apart. Both these cuttings should be lengthwise of the vat, and will leave the curd in long strips about a quarter of an inch thick and three quarters of an inch wide. The object is to facilitate the separation of the whey, which the horizontal cutting does more effectually than the perpendicular, since the whey collects in little tubular cells, which, when viewed with a microscope, look like fine needles standing upright throughout the mass. The horizontal cutting severs them crosswise, while the perpendicular splits only a few of them. As soon as the whey has exuded enough to nearly cover the surface of the curd, cross-cutting should commence, and be continued until the whole is as fine as kernels of corn, or beechnuts. Then apply the heat and raise the temperature steadily and expeditiously to 98° or 100°, as is preferred, constantly but carefully stirring the mass with a rake to keep it from packing—the more effectually this is done, the better—and the stirring must be continued, at short intervals, so as to keep the pieces loose and free, until the curd is ready to dip.

It is very essential that all the whey should be expelled from the pieces of curd by the action of the heat and rennet, so that, when mashed by rubbing between the thumb and fingers, they will look mealy and dry. This is what cheese-makers would call thoroughly "cooked" or "scalded"—and it cannot be properly done unless the curd is cut fine, and the heat is kept up till this condition is attained.

When the whey begins to change, or become a little sour, it should be at once drawn off and the curd stirred and cooled to at least 90°. Then dip and salt with four to five ounces of Onondaga "factory filled" to each hundred pounds of milk worked up. Thoroughly incorporate this with the curd, which should be put to press at a temperature of about 80°. Press lightly at first, steadily following up the pressure, until the whey is completely expelled and the whole is firmly set together. When the pressing is finished, put the cheese in an airy, clean, well-ventilated drying room, so constructed that the temperature can be kept at 70° to 80°, and if everything has been thoroughly done, at the end of thirty days the maker can have the satisfaction of "trying" a fine-textured, firm, mild, clean-flavored cheese.

This is as things should be. They often are as they should not be. Milk is often sour or tainted when it reaches the factory. Sometimes

the night's milk does not keep as well as it ought, in hot weather. Tainted milk is the chief cause of porous cheese; sour milk causes a great waste of butter. When caught with either of these objectionable articles, it is important to know the best that can be done with them, but it is unreasonable to expect them to make as good cheese as perfectly sweet milk.

If milk is tainted, the sooner it is heated, set and scalded, the better. Additional heat of three to five degrees, in this case, will prove beneficial. The "cooking" checks decomposition and the further development of gases. But, in addition, the lactic acid should be allowed to fully develop in the whey, making it unmistakably sour, before being drawn off. This acid curdles or pickles the albuminous matter, which is believed to give the offensive odor peculiar to tainted milk. When the whey is drawn off, the curd should be cooled down to 80°, then dipped, salted and put to press, under at first light, but gradually increasing pressure. The curing requires no particular care, save to puncture the swelled places which may appear on the cheese, and let out the gas. Such cheeses are generally buttery and rich, but do not keep very well for a length of time.

When milk is rather old or a little sour, the sooner every stage of the process is gone through with, the better—for the more time there is consumed, the more acid is developed and the greater the waste. The effect of the acid is to destroy the coverings of the globules of butter, allowing the butter to escape and run off with the whey. In sweet milk, these coverings are smooth and perfect, and will bear a temperature of even 170°, without rupturing and freeing the butter. But when the milk is sour, the sacks containing the globules of butter are rough and broken, and are destroyed by a heat much less than that necessary for the manufacture of cheese. Hence, the trouble with sour milk is to give the rennet and heat sufficient time to do their work of separating the cheese from the whey, the acid compelling the operator to take out the curd underdone, the consequence of which is a "leaky" as well as a sour cheese—and almost every sour cheese is a leaky one. It will be seen, therefore, that the more rapidly the heat is run up, the better—even to the temperature of 105° or 106°—the main object being to "cook" the curd, too much acid being in already. Of course, the cooler the curd is put to press and the more carefully it is pressed, the less the waste of butter, which is likely to be enough to produce a dry cheese, under the best that can be done. The writer has seen a very fair quality of cheese made from nearly lopped milk, the whole process of setting, cutting, scalding, and dipping, not occupying more than half to three-quarters of an hour. There is no trouble in keeping a sour cheese almost any length of time.

The practice in many factories is to heat up a curd very slowly, some stopping at a certain point, and letting it stand to—what? Few have any idea what; but the result is, if the milk is not very sweet, that the acid develops before the heat and rennet have done their work, and the choice is between a sour cheese and one from which the whey is imperfectly separated and is likely to be bad-flavored. Many, too, dip the curds too soft, with the idea of producing a greater weight of cheese; and to this foolish ambition to please the patrons with a "big average," may be attributed much of the bad flavor complained of. But unless the cheese is marketed before it is thoroughly cured, no greater weight will be secured; and if thus

secured, a minute of the loss by shrinkage is made of every lot of cheese, and that will be taken into consideration by the dealer the next time he visits a factory noted for selling green cheese—so that what is gained in weight is ultimately lost in quality, price, and reputation.

We emphatically protest against pig-styes around factories, and against imperfect troughs or sewers to conduct off the whey and slops—which being allowed to collect and rot, and exhale their bad odors under, around, and through the factory, taint the cheese, poison the air and everything and everybody it envelops.

Timber Culture—The Pine.

BY D. C. SCOTFIELD, ELGIN, ILL.

The Pine forests which once existed along the valleys of the Hudson and its tributaries, the Delaware and Susquehanna, have been swept away, mainly within the last sixty years, to supply the markets of our seaboard. Lumbermen have resorted to the vast forests of Maine, Canada, and our Northwestern border, too, and notwithstanding the greatness of the supply, the increasing demand will soon use up what now would seem to be an exhaustless resource. The question already is seriously asked: "What is to be the substitute which will equal Pine timber in value?" We reply, there is none. Then what is the duty of this generation in regard to this matter? We say, plant Pine timber and make it a farm crop. On the same principle that the provident father provides for the present luxury and future wants of his household, let the men of this time provide for the necessities of future generations. A great and wise people are looking to a glorious future; hence they secure the most durable material within their reach, for their public edifices, State-houses and churches. So also it becomes such a people to provide for the future supply of timber. This may be done by individual enterprise, by Government, or by both. The most natural and economical method is, that every farmer set apart a portion of his land for a timber plantation. It may be set in a belt for protection to exposed grounds against the severities of winter, or in square and more compact bodies, as may suit his taste or convenience. Unlike many other varieties of American timber, the Pine does not sprout from the roots, and can only be reproduced by planting the seed.

It is no longer doubtful whether we can raise Pine and other timber with the same certainty and in the same manner as we do apple and other fruit trees. It has been done, it is being done, and it may be done to any desirable extent. To prove that it has been done we have only to refer to the cases where trees have been planted to beautify pleasure grounds or afford a shade to springs of water. This evidence is sufficient for our purpose, for what has been accomplished on a small scale may be done on a large one. A Pine tree is now standing in the State of New York, not fifty miles from the metropolis, that when set in 1813 was a small plant not two feet in height; it now has a diameter of more than three feet and a height of nearly eight feet. Another Pine tree is standing (unless recently removed) in Fairfield County, Ct., nearly a hundred feet in height, more than three feet in diameter at its base and about one foot in diameter at the height of seventy feet. It was planted there, a small tree, about the close of the Revolutionary war. In the County of Albany, N. Y., a Pine tree was cut in the year 1814 measuring more than two and a half feet in diameter at its

base, of a growth of less than sixty years, making more than one thousand feet of lumber. So much for what has been done, and we might multiply cases if necessary.

That Pine timber is now being successfully grown in both Europe and America is too well known to require other evidence. On my grounds, which were planted in the year 1857 with plants not twelve inches long, now stand Pine trees twenty-five feet in height and from eight to ten inches in diameter at the base or collar, which promise at no very distant day to afford a remunerative crop of lumber.

Where young trees are set for belts for protection, or in blocks, they should stand twelve feet apart each way in the rows and be cultivated till they will protect themselves from the growth of exhausting vegetation.

Tomatoes—Keyes' and Others.

The tomato is so important a vegetable, and the comparative earliness of the varieties is so important, especially to those who cultivate it for sale, that we feel no apology is needed for giving so much space to it. In the controversy now going on concerning the varieties—the Keyes' especially—we have endeavored to give both sides a fair hearing, and now give opposite results, obtained by two different cultivators. It should be borne in mind that last season was, at the East, very unfavorable to the tomato, and while it is not right to come to a conclusion from the experience of a single season, it is still less fair to allow the results of an adverse one to decide the matter. "J. T." Paterson, N. J., writes:

"The article in the Dec. *Agriculturist*, entitled 'Improvement in Tomatoes,' it seems to me, does not come to a correct conclusion in regard to the quality, earliness, and productiveness of the kinds named. I have raised tomatoes over fifteen years, never less than three or four kinds, and oftener twice that number, and considered the Early Smooth Red the earliest, and Valencia Cluster and Lester's Perfected, the best of later kinds. Reading Mr. Gregory's advertisement in your paper last winter, I wrote and obtained from him (with other seeds) some Early York, (which he claimed to be earliest), and early Tilden seed. Shortly after, reading Hovey & Co.'s advertisement, I wrote and procured from them a paper of 'Keyes' Early Prolific' seed, and also procured in New York, seed of Early Smooth Red. I planted seed of each, (Early York, Early Red, Tilden, and Keyes'), in same hot-bed, gave same treatment, transplanted the plants into cold frame about the same time, and into open ground as soon as warm weather became settled. The Early York, Early Red, and Tilden, were set out in my earliest ground, and some days afterwards (having but few plants, from a very small paper of seed, and it being claimed) they were a month earlier I set out the Keyes' plants in my garden, on lower and later ground, in order to keep them pure and save plenty of seed. The Keyes' still proved from one to two weeks earlier than the others, though in a less favorable location. My experience was similar to that of Mr. Downing and others published in your paper some months ago. The Early York came next, then Early Red, then Tilden. My plants of the Keyes' were very stocky, leaves very broad, looking more like potato than tomato leaves, bore transplanting well and were very prolific, continuing to bear, and full of green ones when frost killed the vines. The Keyes' tomato is of medium size, of very dark color, more crimson

than scarlet, solid and of good quality, grows in clusters, which ripen pretty evenly and color all over at once, not being ripe below and green around the stem, as with some varieties. The only objection I found was their vigorous growth and sprawling habit. The stalks, being heavy, soon fell to the ground and grew several feet long, some of the plants, I think, covering a space of over six feet square. Perhaps my low, rich garden ground had something to do with it; still, I am satisfied they need more room than most kinds—say rows four feet apart, and plants three feet apart in the row. Probably twice as many plants of the Early York (which is a fine tomato of a dwarf habit) might be planted to the acre. The Keyes' tomato is certainly a distinct variety, and from one year's experience, I think it worthy the attention of all who want early tomatoes. The Tilden is also a fine tomato, but not very early, in color and quality resembling the Valencia, both ripening slowly, and being more tart than most other varieties."

On the other hand, Mr. James Perkins, market gardener near New Market, N. J., thinks his New York Red as early as any of the much praised varieties, and proposes next season to send his first ripe fruit to the office of the *Agriculturist*. He asks those who have new varieties to do the same—the plants not to be kept under glass after May 25th. Come on with your early tomatoes, gentlemen.

Pear Culture for Profit.

The frequent inquiries made with regard to pear culture show that the attention of cultivators is turned to this fruit, as a market crop. The demand for fine varieties has been so much greater than the supply that the fruit in our city markets has always been at a price far beyond the reach of those of ordinary means. The fruit is temptingly beautiful, but from 5 cents to 25 cents apiece is too much for the majority of pockets. The question generally put by those who are thinking of planting pears is: Shall I plant standards or dwarfs? Our reply is: Standards, by all means, with perhaps the single exception of the Duchesse d'Angouleme. The dwarf pear, i. e. the pear on a quince stock, has done good service, but not in the orchard. As these trees come early into bearing, they have enabled us to test a large number of varieties, in a much shorter time than could have been done if the dependance had been on standards alone. For garden culture, and for those whose space is limited, nothing can be better adapted than the pear upon quince; here large and paying crops are not looked for, and the trees receive all the care and culture they require, and without which they soon become useless. It is claimed by some, that if planted deep enough to cover the union of the pear and quince, roots will be produced from the pear wood. This is undoubtedly the case with many varieties, and when it takes place, the tree is no longer a dwarf, but is a pear tree on its own roots, with a clump of decaying quince roots in contact with them, and which we would much rather not have there. The chief objection urged to the pear on its own roots is the length of time before it comes into bearing. This is a condition which varies very much with the different kinds. Some, like the Dix, make one wait a provokingly long time, but the most profitable market varieties are not open to this objection. Had the many plantations that have been made of dwarf trees been of standards the fruit would now be much more plenty than it

is. While the dwarf tree has done much to improve our knowledge of pears, we think that it has been detrimental to pear culture. Some twenty years ago the quince stock was so strongly advocated, that many supposed that the finer sorts of pears could only be grown upon it. We now find very few who recommend its use in an orchard planted for profit.

A good soil, one that will produce a fair crop of any farm produce, will do for the pear, and it is none the worse if it is of a rather stiff nature. Draining should be done, if needed, and the ground well prepared by plowing and subsoiling. Mr. Quinn, a successful grower, recommends preparing the land thoroughly and growing a root crop the year before setting out the trees. This is undoubtedly good practice, as the soil not only gets thoroughly worked, but has the advantage of the liberal manuring given to the root crop.

Varieties. There is no task more difficult than to make a selection of varieties of any kind of fruit that shall answer everywhere. We give here a list of those we should set out were we about to raise fruit for the New York market. In this case the question of quality is secondary to that of profit.

WINDSOR OR SUMMER BELL.—An old sort, worthless for eating, but profitable as an early market fruit and always in demand for cooking.

CLAPP'S FAVORITE.—A comparatively new variety, but so far as tested, of excellent character. Its beauty, size, and earliness, will no doubt make it a leading market sort.

BARTLETT.—Nothing need be said of this well known and popular variety. Pomologists may discuss whether it is a second or third rate pear; cultivators know that "there is money in it."

LOUISE BONNE DE JERSEY.—Succeeds generally; sometimes astringent, but its beautiful cheek makes it sell.

BEURRE CLAIRGÉAT.—Handsone, large, an abundant bearer, and profitable.

DUCHESSE D'ANGOULEME.—About the only variety found profitable on quince, on which it generally does better than on its own roots.

BEURRE D'ANJOU.—First class in all respects, and keeps well.

LAWRENCE.—A good late autumn variety.

VICAR OF WINKFIELD.—An abundant and regular bearer; excellent as a cooking pear and when well ripened fair for the table, but it is so uneven in quality that it is unpopular in the market for the latter purpose. Cultivators, however, find it a profitable variety.

To this list might be added Seckel, Sheldon, and some others. In planting for market, it is a great mistake to have a few trees of many kinds. The orchard should comprise but a few profitable sorts—such as the people know and will buy, or which by their attractive appearance commend themselves at once. Picking and packing are much facilitated, and the commission merchant has much less trouble with a large lot of one or two kinds, than where there are small quantities of a dozen varieties.

POTATOES UNDER STRAW.—In last month's "Basket," page 46, we gave the experience of "Hoosier" which was not in favor of planting potatoes under straw. On the other hand, Mr. J. N. Sterns, Kalamazoo, Mich., says:

"I fitted the ground as for planting in the old way, by marking rows one way, three feet apart, and dropped the potatoes on the mark, from eighteen inches to two feet apart, covering them slightly with soil. I then covered to about the depth of ten inches with old straw, and did

nothing more with them. When the crop was ripe I raked off the straw, and raked out the potatoes, which were mostly on the surface, looking very nice, fresh, and large. The result was, I had at the rate of 186 bushels per acre; while the yield from those planted the old way in drills, and cultivated, on ground by the side of them, was only 75 bushels per acre, which was rather small for this section, owing to the dry season. The soil is a sandy loam."

The Common Pickerel. — (*Esox reticulatus*.)

Our artist, Mr. Herriek, challenges admiration for the faithfulness and beauty of his drawing, which has lost nothing in the engraver's hands. It is indeed a difficult task to engrave so delicate a piece of penciling, and retain the indications of

shade off into nearly pure white upon the belly. The scales are small, brilliant, and edged with black, the fins greenish, those below being tinged with red. The body is covered with dusky reticulations, or irregular bands running one into another, forming a sort of network, which vary in size in different specimens. The pike breeds in March or April, as soon as the water becomes a little warm and food abundant, and during the breeding period the colors are exceedingly intense and brilliant. In addition to the tints named there is an iridescence of brilliant hues upon the gills and sides. The light parts are brighter and the dark ones of deeper color; hence we regard the pickerel, especially the male, as deserving to be ranked among the most beautiful of our fresh water fish. The motions of this fish in the water are

great, he usually makes several "tacks," taking a zigzag course. The accuracy of aim of the fish in making these darts is truly astonishing. Few indeed are the fish that can escape. The enormous jaws open and shut like a steel trap, at the moment of striking, and the luckless creature is engulfed in the capacious maw. The pike does not hesitate, however, if the fish he pounces upon is too large for a single swallow. He will, if pressed with hunger, take one nearly half as long as himself; if necessary, first disabling it, and then getting it head foremost into his mouth. After this, little by little, he works it down. Meanwhile he himself becomes almost helpless, as one might imagine, — having a living fish, half swallowed, and actively wriggling in his mouth — and in this condition small pickerel not unfrequently fall an easy

THE COMMON PICKEREL. — (*Esox reticulatus*). — Drawn and Engraved for the American Agriculturist.

the play of colors upon the surface without losing the strength of the more positive markings.

The pickerel or pike is one of our best known fishes. It is a favorite in the market, and with many, of course, upon the table; a favorite, too, with those anglers who are not such thorough sportsmen that they will not favor a fish so easily captured. The pickerel are among the most voraciously carnivorous animals in the world, and being also among the strongest and swiftest swimmers, the weaker fish about them must be both cautious and active to be able to both pick up a living and elude their jaws.

The body of the pickerel is long and slender, and the head is very nearly one-third of the entire length. It approaches a cylindrical form, the breadth and depth being much more nearly alike than in most fishes. The head is broad; the snout, blunt and flat, somewhat like a duck's bill; the under jaw extends beyond the upper one when the mouth is closed. The upper jaw has no teeth upon the sides and only a few small ones in front, but the roof of the mouth and the under jaw fairly bristle with teeth, some of which are quite large. The base of the tongue and the bony arches which support the gills are covered with sharp teeth directed backward, so that anything once within is extricated with difficulty. The colors vary considerably, according to the abundance and kind of food, the character of the water, or other influences, and also according to the sex and time of year. The prevalent colors are deep green, or bluish-gray approaching black on the back and head, while olive-yellow and golden tints mingle with the greenish or grayish reticulations of the sides, and

peculiar. The shape of the body and location of its fins are such as to give it great speed in straight forward motion, and power to stop or turn on the instant. It has, however, no ability to execute those graceful sweeps and curves which make some of the carp family such attractive denizens of ornamental ponds, basins or vases, where their motions can be watched. The pickerel habitually rests perfectly motionless, not a quiver or wave of a fin being visible, except a slight undulating motion of the pectoral or breast fins by which he balances him-

self; then in the twinkling of an eye he shoots away with almost inconceivable rapidity — so great that the eye can hardly follow him — and stops stock still perhaps at the distance of only a few feet, or it may be, rods. If the distance be

prey to larger ones. The writer once took a large pike from the hook, having in his mouth a small one which had previously partly swallowed the live bait fish, and found all three alive. The pickerel will take almost anything that is small enough for him to get into his mouth, if it has motion resembling life; hence bits of rags, bone, or painted tin, are used for bait, being "trolled" or drawn rapidly through the water. Living fish as long as one's finger are common bait for set lines, and such are frequently used through holes in the ice. The fish spear is often successfully employed in taking pickerel of large size. Strong as he is, the pickerel does not make a hard fight when hooked, and he is so greedy and easily taken that he can never rank high as a game fish. The flesh is good, but does not compare in excellence with that of the trout, black bass, or perch.

Pickerel are found in most of our streams and rivers away from the influence of the sea, but are most abundant in ponds, where they may often be seen in summer, basking in the sun among the lily pads. The pickerel varies in length, mature specimens being often less than a foot in length, and sometimes reaching the enormous size of three feet. The bodies of these very large ones are usually much more robust than others. The engraving which we present is an accurate portrait of a fine large fish, taken by the artist himself.

Its extreme length was 25 inches. The head was accurately drawn from a 4½ pound fish taken from the market, and is represented two-thirds the natural length. Many of the smaller teeth in the lower jaw are not fixed, but seem to be set loosely in the flesh.

HEAD OF PICKEREL.

self; then in the twinkling of an eye he shoots away with almost inconceivable rapidity — so great that the eye can hardly follow him — and stops stock still perhaps at the distance of only a few feet, or it may be, rods. If the distance be

COREOPSIS VERTICILLATA.

Everybody's Hardy Flowers.

Were we to head this article "Herbaceous Perennials," many might pass it by, as being something that did not interest them; so we have given it a title with the same meaning. Those flowering plants which, while all that is visible perishes, each spring repeat everywhere the miracle of the resurrection, should be everybody's flowers. They need neither potting nor puttering, they endure neglect and return attention, and are the flowers to have and to love.

We have made out a list of those that are good and easily obtained; it does not contain all that may be classed under these heads even, and is by no means a list of the rarest. They can for the most part be raised from seed, but as a general thing do not flower until the second year, though some, if sown early, will bloom the same year.

Novices in flower growing are generally impatient people; they can hardly wait for the seeds of annuals to come up, and as for growing a plant for a whole year for the sake of what it may do hereafter, that is not to be thought of.

Those who are in a hurry can get plants in early spring of the florists and nurserymen, or of some kind cultivator, who, if he is a lover of flowers himself, will be glad of an opportunity to aid another—only don't be a plant beggar.

Plants of this class do best in a good rich garden soil, light rather than heavy; they generally increase so rapidly as to require division every three or four years. Take up the clumps in early spring, or in autumn after the tops are dead, divide by means of a sharp spade or a knife, always observing the manner of growth and making the division in a manner that shall secure buds with the portions of the root. Reset as much as is desirable and then—throw away the rest? Not at all. With these plants one can cultivate friendly relations and make

many a less fortunate plant lover happy. So give away what can be spared and thus help to make them "everybody's flowers."

AMERICAN COWSLIP.—Shooting-star, *Dodecatheon Meadia*. 1 foot; pale purple; June. Figured in the *Agriculturist* for July, 1866.

ASTILBE JAPONICA.—Incorrectly *Spiraea Japonica* of the catalogues; no common name; 18 inches; white; fine foliage; June. Figured in the *Agriculturist*, Jan., 1867.

BELL-FLOWER.—*Campanula Carpathica*; 18 inches; blue, with a white variety; all summer. This is one of the best of the many Campanulas, being delicate in habit and a profuse bloomer and remaining in flower for a long time. The Peach-leaved Bell-flower and others are good; see seedmen's and florists' catalogues.

BLEEDING-HEART.—*Dicentra spectabilis*. Dielytra of writers who do not know any better; 2 to 3 feet; rose pink; May. Beautiful in foliage and flower, and one of the finest of all plants.

CANDYTUFT, PERENNIAL.—*Deris sempervirens*; 6 to

10 inches; white; July. Excellent for bouquets.

CHRYSANTHEMUM.—Belonging to this are the well-known fall blooming flowers, of such great variety of colors, *Chrysanthemum Indicum*; the Fever-few, with its small white flowers, which is only half hardy; and what are called Pyrethrums, *Chrysanthemum carneum*, of which the double forms are of great variety of color.

COLUMBINE.—Several, and all beautiful, from our common wild one, *Aquilegia Canadensis*, to the rarer *A. glandulosa*, *A. alpina*, and *A. coerulescens*.

COREOPSIS.—*C. verticillata*, called *C. tenuifolia* in some of the catalogues. 18 inches; yellow; July to September. While yellow flowers should not preponderate in a collection, some are needed, and we add this to the list as much on account of its finely cut foliage as for any beauty of its flowers. It is found wild at the South and West, and is one of those old garden plants that seem to have found a new appreciation with our florists. Figured above.

EVENING PRIMROSE.—Several species of *Oenothera* are cultivated. One of the best is *O. Missouriensis*, the Missouri Evening Primrose. A low spreading plant, with silvery foliage and an abundance of pale yellow flowers, which are six inches across.

FLAX PERENNIAL.—*Linum perenne*. 18 inches; blue; May to July, and later; graceful in habit, and long in flower. There are varieties differing in the shade of blue and white.

FRAXINELLA.—*Dieltamnus Fraxinella*, purplish or white; 2 feet; June and July. An old and favorite flower, with a strong Lemon-like odor.

FORGET-ME-NOT.—*Myosotis palustris*. 1 foot or less; pale blue, with a yellow eye. In a shady place, it blooms nearly all summer.

LARKSPUR.—Some grow as tall as 6 or 7 feet; all are desirable. *Delphinium formosum*, *D. grandiflorum*, and *D. elatum*, are among the best.

LILY OF THE VALLEY.—*Convallaria majalis*.

JAPANESE KNOTWEED.

This well known, graceful spring flower does best in a shady place. Grown from the root.

LYCHNIS.—including the Scarlet Lychnis, Ragged Robin, Mullein Pink, and others—these are not very delicate, but are very showy.

PEA, PERENNIAL.—*Lathyrus latifolius*.—Climber; light purple and white; all summer. This, though a climber, flowers best when allowed to spread upon the ground. An old, well established plant, is a very beautiful object.

PHLOX.—The Moss Pink, *Phlox subulata*, makes a low dense cushion of foliage, covered with flowers in April and May. The taller Phloxes of which the florists have many named varieties bloom from June until September.

SPIREAS.—The herbaceous Spireas are few and desirable. *S. filipendula*, the Dropwort, and *S. Ulmaria*, the Meadow Sweet, are white, and the first especially desirable for its fine foliage.

SPRING ADONIS.—*Adonis vernalis*. 1 foot; pale yellow; May; foliage delicate. This is figured in the *Agriculturist* for May, 1867.

YARROW.—Our common Yarrow, or Milfoil, *Achillea millefolium*, is well known as a weed; rose colored and red varieties of it are desirable in the garden. Another, *A. Pharmica*, or Succowort, is in its double variety one of our best white flowers, and remaining long in bloom.

The Japanese Knotweed. (*Polygonum cuspidatum*.)

The genus *Polygonum*, although a large one, cannot boast of many species sufficiently elegant to be cultivated for ornament. We are familiar with them as plants to be ejected from the grounds rather than to be introduced, for here belong the False, or Climbing Buckwheat, the Black Bind-weed, Smart-weed, Knotgrass, Goose-grass, and others whose common names indicate their weedy character. The *Polygonum*

Oriente, the Prince's Feather, or Ragged-Sailor, a tall species with rather coarse foliage and drooping spikes of rose colored flowers, is often seen in the humbler attempts at gardening, in company with Sunflowers, Love-lies-bleeding, and other similarly coarse and weedy plants.

We have for some years known a species which is really worth cultivating, but which does not seem to be much disseminated—the *Polygonum cuspidatum*, a native of Japan. It is a perfectly hardy perennial, which throws up branching stems three or four feet high, bearing large oval leaves, which are long-pointed at the apex,—hence the name *cuspidatum*. The small white flowers are in little clusters in the axils of the leaves, and are succeeded by the fruit, or seeds, which being of a pale rose color are more showy than the flowers themselves. Though the flowers individually are small, they are produced in such abundance and have such a graceful droop that the plant is quite showy in flower and fruit, and its effect is heightened by the reddish color of the stems. The plant increases very rapidly, and soon forms a large clump; indeed this is its greatest fault, and one which unfits it for use in small borders. It is very effective for planting where there is plenty of room, and it will grow in any soil and situation, even under the shade of trees. It blooms in July and August, and continues for a long time. There is a variegated leaved form which is rather curious, but the variegation is not constant.

Laying out an Orchard.

When trees are set equidistant in parallel rows, the land is not laid off to the best advantage. The plan is modified by making the trees in one row alternate with those in the next, a method to which the term *quincunx* is applied. Warder differs from others in his description of quincunx, which he says "is constituted by one central tree surrounded by six, and all equidistant." This is planting in hexagons, and

Fig. 1.—PLAN OF THE ORCHARD.

while we regret that Warder should have given to it a name that is likely to lead to confusion, we quite agree with him that it is the plan upon which the greatest number of trees can be set upon an acre and all be at equal distances.

Fig. 2.

The trees are set at every alternate intersection of the cross marks with the longitudinal ones. The accompanying diagram, fig. 1, will show the arrangement, and it will be seen that each tree is at the corner of an equilateral triangle, and is also at the centre of a hexagon, formed by six other equidistant trees.

Mr. Nathaniel Hill, Pleasant Hill, Ohio, has another way of arriving at the same result. He uses a triangular wooden frame as a guide. The frame, fig. 3, is made of two strips of plank placed so as to form two sides of a triangle of the required length, and provided with a cross piece to keep it in shape. In laying off an orchard, but one straight line has to be marked for a base line and the distances for the first row

Fig. 3.—PLANTING GUIDE.

staked out upon this. By placing the two arms of the frame at the stakes of the first row, the places for the trees in the second row are indicated by the point of the frame, and so on.

Mr. H. sets his trees 30 feet apart, and though it requires three men to move the frame, he thinks it less trouble and more accurate than any other method. Whatever plan may be preferred for laying out the orchard, it is best to mark the position of every tree by a stake before commencing to plant. In this way all "inaccuracies may be remedied with much less trouble than after the trees have been set. Some years ago we figured a planting guide, the use of which will insure the placing of the tree in the precise position occupied by the stake. It is a board, 8 feet long, fig. 3, with a hole at each end and a notch in the middle. Lay this on the ground with the notch at the stake, drive a pin into the ground through each hole, and lift the board off, leaving the pins in the ground. The stake may be removed, the hole made, when the board is placed again on the pins the notch accurately indicates where the trunk of the tree should stand.

Market Gardening around Philadelphia—What Vegetables are Grown.

BY HENRY A. DREER.

[In response to a request for a list of the seeds in demand by the Philadelphia Market Gardeners, Mr. Dreer communicates the following. Where the varieties differ from those popular with growers for the New York markets, we add those preferred by the latter, in brackets. The list in this way will present at a glance the varieties approved by the two largest market gardening communities in the country.—Eps.]

Philadelphia has long been noted for its superior markets, and particularly for the profusion and quality of the vegetables found in them. The market gardeners of Philadelphia are a thrifty, industrious, and honest class of people, not much given to "book learning," but intelligent enough to know what pays best to grow, and how to grow it. That portion of the city known as the "Neck," (being the strip of land below the built-up portion of the city lying between the Delaware and Schuylkill rivers,) has from time immemorial been occupied as "Truck Farms;" and here many of the descendants of the original settlers, (Swedes and Germans) still live, although the march of improvement is rapidly encroaching upon them, and has already driven many of them to other localities around the city.

In no one thing are our gardeners more fastidious than in the selection of their seeds. They want the best, and are willing to pay for them; they are great sceptics, and slow to experiment with new sorts, preferring well tested, old varieties. They are also very careful in saving many of their own seeds, and have a strong prejudice against many of the imported varieties.

The following is a list of the leading kinds grown by them for the Philadelphia market.

ASPARAGUS.—*Lesh's Mammoth*; to grow to perfection must be planted four to five feet apart. [Giant; more depends upon the cultivation than upon the variety.]

BEANS.—Dwarf or snap; for early, *Early Mohawk*; for general crop and late planting, the *Valentine*, which we consider the best. [Early *Valentine* for early, and *Refugee* for late.]

BEANS.—Pole or running. *Large Lima* for shelling, and *Giant Wier* for a snap bean. The latter is popular in our markets, but the supply has not yet been equal to the demand.

BEEF.—The *Early Bassano*, known as the "Early White Beef," is superseded by the *Simon's Early Red Turnip Beet*. It is quite as early, much better shaped, dark colored, and is the most extensively grown of any, not only for early, but in later planting for late use. The *Half-long Blood*, known also as the "Baltimore Beef," is also largely grown. [Short-top *Round*, *Early Blood Turnip*, *Long Smooth Blood*.]

CABBAGE.—*Large Early York*, *Early Wakefield*, *Early Winningstad*, and *Early Flat Dutch*, follow in succession; the *Large Early York* is, however, the leading sort. These varieties are sown in September and wintered in cold frames. The *Philadelphia Drumhead* and *Flat Dutch* are sown in the spring. Of these our gardeners will use no other but home-grown seed, they have been so often deceived in imported seed. [Early *Wakefield*, *Jersey* grown seed, preferred for early; *Flat Drumhead*, *Late Bergen*, and *Drumhead Swoy* for late.]

CARROFLOWER.—*Early Paris*, *Le Normand*, and *Wolchouen*. [Early *Erfurt* for early; *Thornburn's Nonpareil* for late.]

CARROT.—*Early Shorthorn*, *Scarlet Horn*, *Long Orange*.

CELERY.—*Turner's Incomparable Dwarf*, and *White Solid*. Philadelphia growth is preferred; the imported seed is apt to produce hollow stalks. [Dwarf sorts usually grown under the names of *New Dwarf*, *Incomparable Dwarf*, *Early Dwarf*, *White Solid*, &c.]

CORN SALAD is very extensively grown for early spring use. It is sown in September, and covered in the winter with a sprinkling of straw.

CORN, INDIAN.—*Adams' Early*, only salable until the *Eight-colored Sugar* and *Evergreen* appear in market; the former being hardy can be planted much earlier than the others. [Early *Darling*.]

CUCUMBER.—*Early White Spined*, for salad, and the *Long Green*, for pickles.

Egg PLANT.—*Large Round Purple* (prickly stem) is preferred. [New York *Purple*.]

ENDIVE.—*Green Curled* is the popular sort.

KOHLRABI.—*Early White Vienna*, and for late, the *Large White*.

KALE OR BORECOLE.—The *Dwarf German* and *Scotch* are sown in the fall, and slightly covered during the winter for early greens.

LEEK.—*Large Plug* and *Large Musselburgh*.

LETTUCE.—For early heading, the *Early Cabbage* and *Brown Dutch*; later use, *Royal Cabbage* and *Curled Indiv-head*. The latter the best for early summer use. [Early *Simpson*, a variety of the *Curled Silesian*, preferred for early.]

MELONS, MUSK, are principally grown in New Jersey for our market. The leading kinds are *Jenny Lind* for early; *Netted Citron*, *Pine-apple*, *Nutmeg*, *Turkey-cap* and *Persian* for later, and follow in the order in which they are named.

MELONS, WATER, are also grown in New Jersey. The favorite variety is the *Mountain*

Seelet, known also as the "Ice Cream;" the true Ice cream is, however, quite a different melon, the seeds being *white*, and the flesh of a much paler red. [*Mountain Sprout.*]

OKRA OR GOMBO.—*Dearf Long Podded* is extensively grown, and more popular every year.

ONION.—Our market gardeners confine themselves to two sorts, the *Large Yellow Strasbourg*, and *White or Silver Skin*, and these must be grown from *Pennsylvania* seed, or they cannot produce the beautiful hard little sets, or buttons, which can be grown nowhere to such perfection as here; immense quantities are raised.

PARSNIP.—*Large Sugar or Hollow Crown* is the leading sort. [*Student* is raised to some extent.]

PEAS.—*Extra Early*, known also as "Landreth's Extra Early," "Dreer's Extra Early," "Hancock's Early," is the leading sort, and the names of different growers are attached to designate it. It is peculiar to the soil and climate of New Jersey, and I believe the seed can nowhere be grown to produce such early crops as on the light sandy soils of New Jersey. The great object with a market gardener is to get a pea that will blossom nearly all at one time, so as to set evenly, that the crop may be gathered in a few pickings; this the New Jersey grown peas will do. They are therefore sought after by all extensive growers, and immense quantities are grown to supply the pea growers in other sections; our market gardeners will buy no other seed if these can be had. They are also planted towards fall for a late crop. The following varieties are also more or less grown: *Blackeye Marrowfat*, *Blue Imperial*, *Champion of England*, and *Eugenie*. [*Daniel O'Rourke.*]

PEPPER.—*Large Seelet Bell* for stuffed pickles, *Tomato-shaped Cayenne*.

RADISH.—*Long Scarlet Short-top*, *White and Red Turnip*, *White Summer*, *Yellow Turnip*, *Black Spanish*.

SALSIFY OR OYSTER PLANT.—The home-grown seed preferred to the imported.

SPINACH.—*Round leaved* *Savoy* extensively sown in the fall for early spring use.

SQUASH.—*Early Bush*, *Long Green Crookneck*, for summer; *Hubbard* and *Boston Marrow* for winter use.

TOMATO.—*N. J. Extra Early*, *Large Smooth Red*, *Tilden*, *Cook's Favorite*, *Fige*, are all more or less grown, much depending on the locality and the time they are wanted for market. The *Tilden* and *Cook's Favorite* are great favorites in our market, as they are both solid, smooth, and of a beautiful red color. The *Cook's Favorite* is also extensively grown for late use, canning, etc. For this purpose the plants are set out about the 1st of July, and upon the approach of frost the unripe fruit is picked and ripened under glass; we have kept them in this way until Christmas. It is folly to condemn a variety as worthless, as so much depends on the season, soil, and climate, as well as the seed, of which so much of a worthless, mixed quality is yearly offered.

TURNIP.—*Early White Flat Dutch*, *Purple-top Strap-leaved*, and *Purple-top Seede* or *Ruta Baga* are the only kinds grown to any extent.

CATALPA KEMPFERI.—This Catalpa is a great improvement on our common species; it is hardy, and forms a neat, small tree, with a regular, spreading head. Mr. Meehan, in an article in the Horticultural Annual, mentions this species, and says, that he never knew it to bloom. It has bloomed for several years with Mr. W. S. Carpenter, in Westchester Co., N. Y.,

and is ornamental in foliage, flower, and fruit. It produces its seed pods in such abundance, as to impart a striking character to the tree; they are more slender than those of the common species, and are in clusters of fifty or more.

The Grape Vine—How it Grows and What to Do with it.—2nd Article.

As introductory to a description of the methods of training the vine, we gave on page 62, (February,) some points in its anatomy, which we briefly recapitulate. A growing shoot of a vine is a series of nodes, at each of which is

FIG. 3.—NODE WITH LATERAL.

borne a leaf upon one side, and generally a tendril, or a cluster of grapes upon the other; at the angle where the leaf and stem meet are two buds. These buds are of the greatest importance: one of them is to grow the next year, and lies dormant during the summer it is formed, acquiring strength for its proper development; the other bud pushes the same summer, and forms a small branch in the axil of the leaf. This branch is by vine growers called the *lateral*.

In figure 3 we have the node, and its leaf with the tendril opposite, the larger part of which is removed to save room. Where the leaf and stem join we have the bud, *f*, and a side branch, or lateral. The lateral is an exact repetition of

FIG. 4.—NODE IN WINTER.

the stem from which it sprung, and, like it, is a succession of nodes with leaves, buds, etc. In this figure the lateral is shown as broken off at *a*, as will be explained further along, and from its node another lateral has grown.

In autumn the green wood of the vine has ripened and become brown, the leaves having performed their functions spontaneously drop from the node, the tendril dries up, but does not fall off of itself, and the node at this time appears as in figure 4, which we borrow from Mohr. *A* is the scar left by the fallen leaf; *B*, the bud; *C*, the lateral, and *D*, the tendril, or the foot-stalk of a fruit cluster, as the case may be.

In treating of the vine we have thus far employed the terms branch, stem, and shoot, in their common acceptation, for in speaking of plants in general most of us are in the habit of using them to mean much the same thing.

Writers on the vine find it necessary to give them a definite meaning. The growth which prolongs during the summer, while it is still green is called a *shoot*. When the wood of a shoot has ripened, it becomes a *cane*, and when a cane has itself borne shoots which have ripened into other canes, it is then a part of the *stem*.

The shoots all start from buds that have been prepared the year before; in figure 4, the bud *B* will this spring produce a shoot. This will elongate indefinitely, but always consist of the succession of nodes, with their appendages of leaves, tendrils, etc., already described. On a vigorous shoot, the lower nodes, instead of producing tendrils, will bear clusters of grapes, and this is the only place where fruit is borne—on the shoot, the growth of the present year. When the leaves have fallen and the fruit is gathered, what was the shoot is then a *cane*, which can no longer bear clusters directly from its ripened wood. It is furnished with buds, which will next year produce shoots, and these will bear fruit. The cane has a light colored, smooth bark, but after it has passed two seasons, one as a shoot and the other as a cane, it becomes a part of the *stem*, a name which it retains as long as it remains a part of the vine. It has a dark bark, the outer layers of which become loose and spontaneously separate.

It will be seen that the bud is a most important appendage to the vine. Situated at the node, just at the base of a leaf, it is so placed that in its young and tender state it is protected from accident, and it is also where it can be properly nourished by its parent leaf, so to speak.

Much of the energy of the vine is directed to perfecting the bud, which has another year so important a part to play, for it is to become the shoot which is to bear the foliage, the fruit, and in fact to be nearly all that we look for in the vine. A bud, then, may be properly regarded as an undeveloped shoot; its leaves, and even its fruit are prepared beforehand, and the fruitfulness of the vine will depend upon the opportunities that the bud has had for maturing properly. The vine has not, like the pear, peach, etc., fruit buds and leaf buds, but both leaves and fruit come from the same bud.

All the different systems of pruning and training are founded upon the fact that fruit is always produced upon a shoot, or new growth, and they have for their object the perfection of the buds during the season of growth, and the removal of so much of the ripened wood as shall leave a sufficient number of buds to produce as much fruit as is consistent with the general and continued welfare of the vine. The illustrations of pruning and training present us with very different looking vines, but they are easily comprehended by any one who understands the manner of growth of the vine, and no system can be followed long without this knowledge.

Starting Plants in the House.

Many who have no hot-beds are able to have a few early plants of tomatoes, etc., by starting them in the house. A sunny window in the kitchen is the best place, as the atmosphere is usually less dry than that of the other rooms. We have before recommended this plan, and now allude to it for the purpose of calling attention to a box which will allow the plants to

be removed at transplanting as readily as from flower-pots, and which has the advantage over the pots, as it does not require such close attention in watering.

Figure 1 shows the box complete. It may be

Fig. 1.—BOX WITH DIVISIONS.

made of any convenient size, 18 x 10 answering very well, the sides and ends well nailed together; across the bottom at each end is nailed a strip, and a loose bottom of thin board, just

Fig. 2.—DIVISIONS SEPARATE.

the interior size of the box, slips in and rests on these cross pieces, and is left loose.

The partitions are shown in figure 2; they consist of strips of common pasteboard of the proper length, put together by slitting each half way through at the points where they cross. The short pieces are slit from the top edge half way down, and the long pieces from the bottom edge half way up. The partitions being put into the box, and the divisions filled with earth, it is ready to be used. In removing the plants, all that is necessary to do, is to set the box with its loose bottom resting upon a brick or block, when the sides may be slipped down and leave the contents free. Each division is a little square block of earth, containing the plant, and may be handled as readily as a ball of earth from a flower pot. A box for accomplishing the same end has been patented in this country, but the one here described is not patented, and may be used by any one. It was originally published in England in Shirley Hibbard's *Floral World*.

The seeds may be sown in a box without partitions, and the plants, when they show two or three rough leaves, may be transplanted into the divisions of this box. The seeds of those plants, such as cucumbers, melons, corn, etc., which do not transplant readily, may be sown in them at once. A rich, light soil, one that will not readily become compacted by frequent waterings, should be used, and in sowing the seeds, do not cover them too deeply. Many small seeds fail from this cause, and the seedsman is charged with selling poor seeds; with large seeds the depth is not of so much consequence, as the young plant has strength enough to push through it. Take care that the plants do not suffer for want of water, but in watering do not use water directly from the well or cistern; either allow it to stand until it has acquired the temperature of the room, or bring it to that temperature by the addition of hot water. Allow the young plants to have plenty of light; if they are disposed to wilt in the middle of the day, shade them by a screen of paper or muslin. As soon as the weather is mild enough, set the boxes out of doors during the day, but bring them in before the air becomes chilly. Boxes of this kind will be found very useful in the hot-bed, where they will answer in place of flower pots.

The Mangrove Tree.—(*Rhizophora Mangle*.)

"The tide is low, let us go down to the trees and pick some oysters," said a friend to us one day, on the Gulf of California. We went to the beach, where there was a thick belt of Mangroves and gathered an abundance of oysters from the roots, that had been left bare by the tide. The Mangrove is an interesting tree, curious in its manner of growth, and performing a useful part in the contest between the sea and the land. It is a shrub or small tree, sometimes thirty feet or more high, and is found along the muddy shores of the sea in the tropics. South Florida and near Guaymas in the Gulf of California are the only places where we have met with it, and there it grows only eight or ten feet high, but in the West Indies it becomes more tree-like. The leaves are evergreen, thick, and leathery; the flowers, four petalled, pale yellow, and rather showy. One of the remarkable characters of the tree is its tendency to throw out roots from its trunk at a considerable distance above the surface of the water; these arch off from the trunk, and ultimately find their way into the mud. In large trees, these roots are

growing downwards. The radicle penetrates through the apex of the nut, as shown in fig. 2, and elongates and even shows the rudiments of rootlets, as if to make sure of the chance of growing before it leaves the parent tree. As the plant grows in the mud and water of the coast, this would seem to be an excellent provision to prevent the seed from being washed away; it is kept in a place of safety until the embryo plant is so far advanced that it is ready to grow at once when dropped into the mud. The Mangrove

Fig. 2.—MANGROVE FRUIT.

is constantly encroaching upon the sea, and gradually extending the borders of the land. This it is enabled to do by its two peculiarities

of growth, that of throwing out roots from the trunk and branches, and that of dropping its little plants where they are to grow. The thicket will of course gradually progress, as a series of young plants when dropped fall beyond the line of the roots of the old ones; these new plants grow up and bear fruit, which when it has germinated, is dropped still further out, and so the thicket slowly but surely travels seaward. In the meantime the roots are weaving a network that retains earth and other matters washed down from the land, and gradually the area of dry surface is increased. The name *Rhizophora* is appropriate, as it means root-bearer.

Fig. 1.—MANGROVE TREE.—(*Rhizophora Mangle*.)

thrown off eight or ten feet above the mud, and are sometimes as large as a man's leg. The engraving, fig. 1, shows the singular appearance produced by this manner of growth; the tree looks as if it were supported upon an artificial frame-work. As the trees grow close together it can readily be conceived what an impenetrable thicket these interlaced roots must form. The fruit of the Mangrove is a small, one-seeded nut, which, instead of following the usual course of seeds, remains upon the tree and germinates. The young plant can hardly be said to "come up," as in this case its early life is passed in

If the point be shod with iron it will work easier and last the longer. *Penails.* The Horticultural Indelible is good for those who will take pains. Provide for a label of some kind; common lead pencil is better than none. *Ties.* Keep a ball of strong but soft cotton or hempen twine at hand for tying up things that need it at once. *Labels.* These are made by machinery, of convenient size and shape for tying to trees or sticking into the ground. As these are not generally accessible, most persons make their own. The whittling propensities of boys can be turned to good account in making labels.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Kerosene Oil—Explosions.

The introduction of burning oils made from coal, and later from petroleum, has added greatly to our domestic comfort, and given the dwellers in the country one of the advantages of those who live in cities—a cheap and powerful light. Indeed, we think that kerosene makes a pleasanter light than gas, and the city housekeeper has no advantage over the rural one, so far as light goes, other than not being obliged to trim and fill her lamps. How much more the evenings are enjoyed, when the room is made cheerful by sufficient light! It is of itself a great inducement to reading. But as we sit down to read the paper, with a mental blessing on the man who invented kerosene, our enjoyment is seriously disturbed by reading the, alas, too frequent accounts of severe burning and death from exploding kerosene lamps, and we begin to be suspicious of our own lamp, which, though it has always behaved itself most commendably, we feel might at some time make us a subject for a newspaper item. We soon regain confidence in our lamp, which lasts until we hear of another "shocking accident." We suppose that these have been the feelings of many who burn kerosene, and it is worth while to look into the matter, and see to what these so frequent explosions are due.

Coal oil and petroleum consist of several distinct oils, which have different boiling points. If the crude article be heated to 100°, for instance, all that portion of it which will boil at that temperature will be driven off by evaporation. If the heat be increased to 110°, and steadily maintained there, another portion, that was not volatile at 100°, will be evaporated; and so on. The refining of the crude oils is done in accordance with these facts: the crude oil is put into a still, and separated, by the proper application of heat, into liquids that have different boiling points. Those which evaporate at the lowest temperatures are known as naphtha, benzine, gasoline, etc.; that which boils at a higher degree of heat is kerosene, and after that has been distilled off, there is left in the still a portion of oil not volatile.—Benzine and the other oils which have low boiling points evaporate rapidly at ordinary temperatures, and when their vapors are mixed in proper proportions with air, a compound is formed which will explode whenever light is applied. Hence these cannot be used for illuminating purposes in ordinary lamps.

They, (benzine, etc.,) are produced quite abundantly in the process of refining crude oil, and as the demand for them for use in the arts is small in comparison with that for kerosene for burning, they are always very much cheaper than kerosene.

Kerosene, properly made by a reliable manufacturer, will not inflame at the temperature to which it is likely to be exposed in use, nor give off a vapor that will form an explosive compound with air.

As the oil for burning brings a so much higher price than benzine, there is a temptation to the refiner to leave as much of the latter in his kerosene as he can with safety. For the same reason there is a temptation to the dealer to buy both benzine and kerosene, and mix them, to reduce the price at which he can sell them. This is largely done, and it is very common to find kerosene of two qualities and prices in the retail stores. The low priced is made such by the addition of the dangerous benzine.

There are several forms of apparatus made for the purpose of testing the safety of the oil, and every dealer should have one and learn how to use it.

A sufficiently accurate test may be made by any one who has a thermometer. Place a cup in a tin or other vessel of water which is shown by the thermometer to be at 110°. When the cup is warmed through, put in a tablespoonful of kerosene. Hold a lighted match just above the surface of the kerosene, and if any vapors have been given off, they will

take fire. This is not attended with any danger, and a careful person, who will properly observe the conditions of temperature, may obtain correct results. Any kerosene that will stand heating to 110° without forming an inflammable vapor is safe to use, as far as danger from explosion is concerned. Some of that which is sold at the cheap rates will form an explosive vapor at the temperature of a well warmed dwelling, and the wonder is, not that there are so many accidents, but that there are so few.

The only thing the purchaser can do is, to avoid a cheap article, and to procure his supplies of persons who not only would not adulterate themselves, but who regard the safety of others sufficiently to take pains to obtain their stock from reliable sources only. Each dealer should insist upon a guarantee that the kerosene will not form an explosive vapor at a lower temperature than 110°.

There is a law of Congress against selling any illuminating oils that will not stand the test of 110°, and any one who sells dangerous oils is liable to both fine and imprisonment. We cannot learn that any one was ever even complained of, much less punished, under this law, so indifferent are the people to that which concerns their own welfare.

Fig. 1.—LETTER BOX.

Household Ornaments.

Articles of ornament in the household have so much influence in the family as educators, that we consider them quite as important as objects of utility. Indeed, we should prefer to spare some of the necessities of life, rather than miss the articles of taste that speak to us daily from the walls of our home. They are not only beautiful in themselves, but they remind us pleasantly of the friends who have thought of us at our household anniversaries. Costly pictures and splendid upholstery are well enough for those who can afford them, but those who possess them are not always people of taste, and they are by no means essential to the cultivation of taste in us. We may have beauty of form and color on a small scale and in inexpensive material, that shall kindle the imagination and give pleasure to the feelings quite as effectively as the gems of art. The homes of many who have a competence are utterly bare of ornament. Nothing is done, nothing is seen within to administer to our esthetic wants. The whole aspect is cheerless, and one escapes to the sunshine and verdure without, with a feeling of relief. It is worth much to children to have around them objects of refinement and taste, to cultivate in them an appreciation of the beautiful. It greatly helps the formation of habits of neatness and order in them and tends to make home cheerful and happy.

Fig. 1 shows a letter box with three divisions, very convenient for holding unanswered letters, envelopes, small note paper, postage stamps, memorandum cards, pencils, and the small household journal of which we spoke last month. It is about 6 inches long, 3 deep, and 6 high at the middle of the back. It may be made of black walnut or butternut, or of white wood or white pine, stained

and rubbed with oil. The front shows open carved work with leaves and flowers, and is too elaborate for a beginner; but a part of the carving can be left off and still make a very convenient box. It is put together with small iron pins and with wooden pegs and glue. It can either stand on the table, or be suspended from the wall in any convenient place.

Fig. 2 represents an oval frame for a carte de visite photograph. It is made from a piece of a cigar box, but any other thin, dark colored wood will answer as well. It is about 3½ by 4 inches. It is first marked out with a paper pattern and pencil, and then cut away with a sharp knife, and finished off with file and sand-paper, and rubbed with linseed oil. A small ring is attached to the back with a loop of tape and gum, for the purpose of hanging the picture.

Fig. 2.—FRAME.

A MATCH BOX.—Fig. 3 shows a hony scale or plate from a sturgeon. The edges are serrated and afford conveniences for fastening the box, by means of two screws or tacks, directly to the wall, or to a neat shield of black walnut or other wood, as shown in the figure. The surface is just rough enough for lighting a match, which suggests its appropriate use as a match box. Convenient and durable.

Too Much Help in Play.

How to entertain profitably and innocently the young folks of the family is often a difficult problem for the mother to solve. We think it is made a good deal harder than it really is. Our German fellow citizens, with their characteristic fondness for philosophy, have studied this matter profoundly, and flooded the nursery and kitchen with toys and playthings that leave Young America nothing to do but look on and see them play. We have puppets that do their own dancing, and turn somersaults of their own free will, rail cars and carriages that go by invisible machinery, horses that canter without whip or spur, and swings that require no one to boost the swinger. The automaton principle has been carried into almost every plaything in which it could be made available. We think the philosophy of the inventors is seriously at fault. If it were not for the curiosity of Young America, which is piqued by the invisible springs and the inestimable privilege of pulling them to pieces and seeing how they are made, they would not answer for playthings at all. Children have an irrepressible desire to make their own amusement and to have it in their own way. They resent too much showing as an impeachment of their capacities. How often does the little boy spurn your proffered help with the indignant exclamation "I want to do it myself." The little girl is equally anxious to make her own dolls and dress them. The purchased article, however complete, is not quite so satisfactory as the workmanship of her own hands. The sled that Ben makes from a pair of runners, split from a crooked stick which he cut in the woods and brought home on his back, is more serviceable than anything he can buy in the city. He will never see a wagon so much to his taste as the rude affair he made from an old soap box and a pair of wheels cut solid from a white oak board. Has he not bored every hole in it, and driven every peg and nail? Who has a better right to be proud than he, as he drags his sister away to school in a carriage of his own making? It may lack paint and gilding, but there is a beauty in it he will never see in the products of the factory in later years. If he can harness the dog Carlo into the fells, with tow strings

Fig. 3.—MATCH BOX.

of his own twisting, and drive him with a home-made whip, his happiness is complete.

We want, then, to give our children the raw material of playthings at the earliest moment they are capable of handling tools to make them into toys, or articles of use, as suits their fancy. This will develop their constructive faculties and tend to make them ingenious and helpful as they grow up. They do not care for anything finished. They are growing themselves and like to make other things grow large or small, as the case may be. Give a boy building blocks and he will construct houses, barns, churches, towers, and fortifications. Give him a house ready made, and his first instinct is to pull the roof off and see what is inside. His destructiveness is started on a precocious development. Give him a well furnished toy chest, and he will soon learn to make his own playthings and will be much better entertained and satisfied than by any amount of toy trumpery imported from the city. The country abounds in the raw material of entertainment, and it is for this reason that children so greatly prefer it to the city, where everything in the toy line is finished.

Bones and Ashes.

Bones and ashes pass through the housekeeper's hands every day. Wood is still the chief fuel in the farm-house and the value of the ashes is pretty well understood. They are prized for the lye they yield, and if there is a surplus from the soap making they help the kitchen garden at the back door. The bones are generally thrown to the dog and lost. Now if the careful housewife would save the bones as regularly as the ashes, she would practise a wiser economy and help her kitchen garden twice as fast. Bones are worth twice as much as ashes for manure, if dissolved, and the ashes will reduce them. Put both into a barrel in the cellar, if you please, and after mixing them half and half, keep them constantly moist with soap-suds, the hotter the better. The suds should not be poured on in such quantities as to leach the ashes. In a few months the bones will be disintegrated and the whole mass may then be mixed and will make an excellent fertilizer for the flower border or the kitchen garden.

Hints on Warming Dwellings.

The old-fashioned fireplace, with its cheerful blaze upon the hearth, was a very defective way of heating a room. There was more poetry in the flickering brands and the shadows dancing on the wall than comfort in the atmosphere. The ventilation was perfect and the warmth sufficient in mild weather, but in the cold days it was impossible to make the back parts of the room comfortable without scorching everything near the hearth. It was enormously expensive, or would have been if wood had not been at every man's door. The fire frame which succeeded was a great improvement, both in saving fuel and in distributing the heat more uniformly through the apartment. It added nothing to the facilities for cooking and was soon succeeded in the farm-house by the stove, which served the double purpose of cooking the breakfast, and warming the people who came to eat it. This is the most popular article now in use for warming the farm kitchen and dining-room. The patterns are very numerous, each having its happy device for baking, boiling, and broiling, in the most perfect and economical manner. The difference is probably much less than the manufacturers would have us believe. They nearly all agree in having a good draft or capacity to ignite and burn fuel rapidly, in regulating the draft and turning the heat to various parts of the stove by means of flues and dampers, and in using a very considerable quantity of fuel to produce the required heat. Furnaces and heaters in the cellar are town devices for warming, when nearly all parts of the house are in use every day and when large expenditure is inevitable.

Whatever apparatus is used, two objects should be aimed at and seemed so far as is possible; an uniform temperature in all parts of the house in

use during the day, and a change of the air as fast as it is vitiated by breathing. The health of the family depends very much upon these conditions, and they are vastly more important than the particular kind of stove or furnace used, the kind of fuel, or mode of combustion. People take cold quite as frequently in the house as in the open air, and wonder at it as they are not conscious of any exposure. If they kept a thermometer or looked occasionally at the stove dampers they would learn the cause. The living room would often show more sudden and extreme changes than any that take place out doors, and it is against these sudden changes that we wish to guard. Many habitually keep their rooms too warm, especially persons of delicate constitution, and invalids. Going from a temperature of 80° or upwards into the freezing air is a violent shock to the most robust. We have frequently been in rooms where the stove was kept nearly to redness, and the whole atmosphere near it must have been much above a hundred. A temperature of from 67° to 72°, Fahrenheit, is warm enough for people in health, and with a little attention to fuel and dampers the rooms may be kept within this range. It is a common error to have too small a furnace or stove for the space to be heated. There must be a considerable body to the fuel, to have the combustion gradual and the heat uniform. The heat of a furnace is best tempered by a layer of ashes upon the coal after it is thoroughly ignited. In addition to the partial closing of the draft. By this method we have found it quite practicable to keep the heat within a degree or two of 70° during the day, and to drop it a little as desired for the night. This is not only much more healthful but more economical. A furnace left to the management of an ignorant or unfaithful servant will consume at least a third more coal than is necessary, and keep the whole house too cold or too hot.

Ventilation is quite as essential to health as uniform warmth. Houses are made much lighter than they used to be, and it is not until quite recently that ventilation has received a fair share of attention. There was occasion for Downing's essay on "The Favorite Poison of America" and it should be scattered broadcast over the land as one of the tracts for the times. The air in a close room is rapidly vitiated by breathing and rendered unfit for use. The problem to be solved is to bring in a stream of pure air from without and to carry off the foul air, without lowering the temperature too much or creating unwholesome draughts. There are many devices for effecting this object. Almost any is better than "the poison."

Rats—How to Get Rid of Them.

A house-keeper is sorely afflicted with these pests, and wants deliverance. She has tried castle time in their holes, sometimes with good effect, and sometimes with none. She has used "Bennet's Sure Death for Rats and Mice," and the sure death only made them more lively. She has caught forty in traps, and twice forty came to their funerals. She suspects Bennet is a deceiver. She would be quite willing to feed them on carrots and turnips, if they would let the potatoes alone; but they seem to know that the Early Goodrich are worth five dollars a barrel for seed, and pitch in accordingly.

There is no such compromise as our friend suggests. There must be clear-riddance, or there will be continued annoyance. The writer has had a long fight with these creatures, and found but one remedy—rat-proof cellars or vessels. Shooting is good sport, but the smell of powder does not prevent their multiplying. The ferrier dog and the cat are good as long as they stand guard, but eternal vigilance cannot be expected of the best ratter. Poison is effectual—on the slain—but the living will not take warning. Wherever vegetables or fruits are stored, rats will come if they can. Cement the bottoms and walls of the cellar, and it is safe. In this remedy we found rest after a ten years' fight. It will cost something but it is effectual, and one may sleep well without fear of rats. Cement and sand are cheap in most parts of

the country. Take one part of cement to two of sand, by measure, mix with water, and apply with a trowel as fast as made. It makes a nice smooth bottom, easily swept or washed.

A Few Hints from an Old Housekeeper.

I want to get new carpets for our two front chambers, and from long experience and observation, I have decided to get "Turkey carpet," as we used to say in my young days. Husband thinks Brussels or velvet would be as cheap, or cheaper, than most other kinds, being so thick and close that it would never wear out.

Now, there are two sides, you know, to this question, and when the handsome side is worn out, there is an end of it. So I shall split the difference, and take the money left over from my favorite Ingrain, and buy a handsome bureau for Jeanette. I know husband won't care when he sees how nicely our two rooms look carpeted alike, as Jeanette says they should be, with good Ingrain, (all wool). If you want a serviceable carpet, and one that looks neat and ornamental, get an Ingrain.

[Ingrain is good, but three-ply is better, and though more costly, is the cheaper one in the end.—Ed.]

I profess to be somewhat acquainted with the carpet family, and because of their dust and untidiness, husband and I have concluded to exclude them from our dining or living room. In a family of a half dozen growing, rampant, romping boys and girls, that are frequently practicing "heel and toe" in all its variations in heavy solid boots, or breaking off into the more graceful waltz or schottische, nothing is so appropriate as a good, old-fashioned oak floor, swept clean, and mopped over every morning with an ample housecloth.

Carpets are well enough in the room where father, mother, and the tamer members wish to pursue their more quiet occupations of reading, writing, and sewing.

Rag carpets, well put together with cotton chain, as we used to have them, were, on account of their durability, tolerated, but the rag carpets of to-day, with hemp chain, as well as all manner of hemp carpets, are the most expensive, because the least durable of any carpets in use. The "German" carpets, with bright showy stripes of chain, all wool, and a heavy filling of coarse hemp thread, although appearing to be heavy and serviceable, are really a very unserviceable carpet, showing the dust and lint, requiring frequent sweepings, and wearing out sooner than so expensive a carpet should. So all entry and stair carpets, filled in with coarse hemp, although appearing handsome and heavy, really wear but poorly on account of the ridges of hard hemp beneath the soft wool chain.

Light colors, either in wearing apparel or carpets, wear much better than dark. Neatly blended figures, covering the fabric evenly and connecting the piles closely, render a carpet more durable. In sweeping carpets, use a fine broom that has been but little worn, skim over the surface with a light, short, airy brush, without making a scrubbing noise or one like a carpenter sawing pine boards. Frequent sweeping wears a carpet more than the tramping. It is a good way to clean the room up with a turkey wing in one hand and dust-pan in the other, going over it whenever dust or lint appears, sweeping, or rather fanning, the dust into the dust-pan. This saves it from the sewerer wear of the broom. There is an art in sweeping as well as in most other housekeeping operations. Some seem to think that raising the dust is of more importance than raising the wind or windows, and that making a big stir generally is the only way to clean a room, and let the dust all settle again from whence it came.

A few well cultivated plants in the sunny windows of your sitting-room give a cheerful air, but remember that a window full of plants, crowded so as to exclude the air and the "sweet sunshine," is rather a nuisance than an ornament.

Do not let the fear of fading carpets lead you to fade the rosy tints from the human flowers about you that are of more value than many carpets.

BOYS' & GIRLS' COLUMNS.

A Curious Fan.

Recently we examined a Japanese fan which is calculated to afford some amusement. At first look, nothing out of the common way was seen. It was opened and closed like any other fan, when spread from left to right; but on spreading it the other way, from right to left, it seemed to have suddenly fallen to pieces, as shown in the accompanying engraving. We will try to describe the arrangement so that our ingenious young readers may make one to puzzle their friends with. First make the splints or sticks for the frame in the ordinary manner. Cut paper or silk for the covering in strips two or three inches wide at the top, according as the size of the fan is to be large or small. The cover strips should be tapered, so that they may fit smoothly when the fan is spread out. The right taper can be learned by laying the splints upon the silk at the top, and bringing their ends together. Next lay one splint (4) upon the right hand edge of the silk, and fasten them there with gum or paste. Make 10 pairs in this way, one pair of splints in each, and number the splints, 1, 2, 3, 4, etc. For the outside parts have one wide and one narrow splint (1, 8). Make a hole in the lower end of the splints, through which a wire is to be passed to hold them in place. Put the wire through the splints, in the following order: through No. 1, 2, 3, 2, 4, 2, 4, 7, 6, 9, 8, 11, 10, 13, 12, 15, 14, 17, 16, 19, 18, 20. Fasten the wire by riveting it at the ends, to prevent the splints slipping off, and the fan is complete.

A New Popgun.

The boys in New York and vicinity are amusing themselves with a new toy, sold at the shops, which is easily made with a jack-knife and a gimlet. Bore a hole lengthwise through a straight pine stick, say six inches long, and whittle it into the form of a small cannon, as shown in the engraving. Fasten a small peg on each side of the cannon, and make a rod to fit the inside of the bore, but about an inch shorter. Bore a knob on the end of this stick. The each end of a strip of India rubber to the pegs, and stretch the middle part of the strip around the end of the knob on the rod, as shown in the illustration. Drop a pea into the mouth of the cannon; draw the rod back, take good aim and let fly; the India rubber spring will force the rod forward, and send the pea out with considerable force.

Why Do We Cultivate Plants?

There are two kinds of life—animal life and plant life,—and yet in many ways these are not so different as they seem. Almost every thing that lives and grows, whether plant or animal, must have light, air, and suitable food, though mouths and stomachs may differ. The leaves of plants absorb light and air, as the pores of our skin do; if they are kept in the dark they become white and slender, just as children grow pale and weak who do not exercise much in the open air.

The real mouths of plants, however, are in their roots, and with these they take in food from the earth. Out of all the various substances which make up the soil, each plant must have the food that is best for it, to grow well, as a horse needs hay and grain, and a dog, meat. For this reason it often happens that some land is better for certain crops than for others, and a good farmer or gardener will not only find out what to plant in his fields,

but will learn what manure will give to the soil in food needed for the grain or vegetables he wishes to grow.

Children who have plenty of suitable, well-prepared food, grow to be strong and healthy; horses and cows, to work well and give rich milk, must be abundantly fed; and so the gardener is obliged to provide well for his fruit trees, vegetables, and flowers, if he expects to make anything of them.—He must keep the earth loose by hoeing, so that the tender roots can run through it easily in search of food, and also that air and moisture may be supplied. He must give water and new nourishment, when the soil needs them, and seek to know what is the best food, and he must keep away weeds which would appropriate the food in the earth.

This care of plants and soil, which we call cultivation, has become quite a science, producing wonderful results, and no boy has more need of education and reading, than one who is to be a farmer or gardener. The wild apple is small, hard, and sour, but under cultivation it becomes large, tender, and juicy; and moreover, many different kinds of apples with different flavors are obtained. Potatoes, when wild, are only poor little tubers, but under cultivation increase in size and furnish food for thousands of people. Lettuce carefully grown for market is brittle and delicate, while if a few seeds chance to scatter and struggle up in the hard path or in a corner among weeds, the leaves will be tough and bitter. Cultivation does quite as much for flowers. They grow larger and more brilliant in color, and many which are single as wild flowers become double. The wild rose has only one row of petals, and is full of thorns, but in gardens and hot-houses the slender yellow stamens swell into broad petals, row upon row; and there really seems to be no end to the different kinds of roses we now have.

About Earthquakes.

The newspapers are giving accounts of frequent earthquakes recently occurring in some of the West Indies, particularly in the Island of St. Thomas. As many as five hundred distinct shocks, it is stated, have been felt. Some of these were severe enough to throw down houses, and destroy much property and many lives. Such visitations have not been uncommon in that part of the world. A most terrible convulsion occurred in the Island of Jamaica in 1692. The land on which stood the city of Port Royal, extending over 1,000 acres, or more, suddenly sank out of sight, the sea rolling in covered the whole area, and ships from the harbor were driven over the very place which a few minutes before was teeming with busy life. One of the most noted and destructive earthquakes ever known occurred in Spain in 1755. A rumbling noise was heard, which was immediately followed by a shock that threw down most of the buildings in the city, overwhelming 60,000 persons in the ruins. A great number sought safety by rushing out upon an extensive marble wharf recently built, where there were no buildings. It suddenly sank with them, drawing many vessels and boats down the immense whirlpool which was formed, and they were seen no more; not a body, or a fragment of the wrecks, returned to the surface, and after the convulsion was ended the water was found to be 600 feet deep over the place. This shock was felt throughout Europe and extended across the ocean to America. The tide rose suddenly to the height of 30 feet along the shores of the West Indies; the coast of Massachusetts felt the shock, and the waters of Lake Ontario were greatly agitated. As lately as 1857 a severe earthquake was experienced in Italy in the vicinity of Mount Vesuvius, by which more than 20,000 persons lost their lives. The city of Quito, in Ecuador, was nearly destroyed by a similar visitation in 1820, and many thousands perished.

These great convulsions usually occur in the neighborhood of volcanoes, although their effects are not confined to those regions, as we have seen in some of the instances here noted. Frequently, if not usually, the earthquake moves forward like a succession of waves, as though the surface of the earth rose and fell upon some heaving bed beneath. Indeed, facts seem to show that this may be the case. It is generally believed that the interior of the earth is a mass of melted matter; that volcanoes are openings in the crust, through which the fiercely raging fires find vent as through chimneys. Various causes might produce a violent commotion in the vast fiery caldron. A portion of the crust beneath the ocean giving way and letting its waters pour in upon the fiery tide would produce tremendous results. Various cases exploding beneath the surface would be followed by great convulsions. We can easily believe that if the mighty elements upon and within the earth were permitted to exert all their power, the globe itself might be rent into fragments. It seems probable, however, from the facts brought to light by geology, that these convulsions of nature are of less frequent occurrence than during past ages, and that the earth is becoming better and better fitted as a habitation of man. The great mountains which cover so much of the earth's surface appear to have been thrown up by volcanic action in times perhaps before the history of man, as there is

no record of any such mighty changes having occurred for thousands of years past. What the future may have in store for this planet is known only to Him who holds all its powers subject to His own will, and we may be sure that wisdom and love will determine all that occurs.

Printers' Mistakes.

Mr. Greeley, who can write a fair hand, but who is usually too much in haste to make letters that any ordinary reader can decipher, one day wrote an article headed: "William H. Seward." His surprise was great on seeing it in print as: "Richard the Third." At another time he wrote: "Three men in buckram," but the compositor set it up: "Three men in a back room." Another author wrote: "Is there no harm in Gilead?" which came out thus: "Is there no harm in Guilford?" Of course the printers had to take the blame, but we sympathized with them when we heard one of our own printers, who was trying to make out a puzzling piece of copy from "Head Quarters," exclaim: "Whoever writes like that ought to be sent to China to mark tea boxes!"

New Puzzles to be Answered.

No. 290. *Puzzle Picture.*—The picture shows how to make a picture of a dog's head on the wall. After trying it, endeavor to find out what kind of fish it represents.

No. 300. *Word Puzzle.*—I am hard, soft, easy, uncomfortable, long, short, wide, narrow, round, square, high, low, good, bad, of all colors, of all sizes, of all shapes, and used by everyone. Transpose me, and I am a drink in very general use, I am of several colors, and foreign birth. Transpose again, and I am one of the most important points of a good guide. What is the word?

No. 301. *Illustrated Rebus.*—Name of an interesting play.

No. 302. *Illustrated Rebus.*—Old proverb in a new dress.

Answers to Problems and Puzzles.

The following are answers to the puzzles in the February number, page 67. No. 296. Turn the picture bottom side up, and the head of the "Old Man of the Woods" may be seen.... No. 297. A flattering lip brings ruin.... No. 298. Behemoth (*See his mother*). The following have sent correct answers to some of the puzzles previously published. J. F. I. Oster, P. B. Wilson, L. F. Irwin, W. and W. Belcher, C. V. Bradley, Wm. H. Fulton, Ebenezer J. Bridge, Daniel W. Leitzel, Lodovica C. Boice, R. P. Bleslow, Isaac Evans Bonsall, Joseph M. Darr, H. F. Swayze, E. Briggs, Jacob Diehl, Samuel N. Stubbs, Ruth Morris, Oscar W. Baker, George B. Slocum, "P. M. A.," Mila M. Walker, Hugh Latimer, Jesse Billups, Israel Camp, Mary Wells, Lizzie Kiener, Maggie A. Gray, J. Milton Snyder, Barksville, Ky., George H. Townsend, L. H. Henderson, D. A. Griffin, Byron Wright, Rachel Daguerre, H. M. Keeney, Addie and Nellie Barnes.

What is the difference between a gauze dress and a drawn tooth? One is too thin and the other tooth out.

The bread of life is love; the salt of life is work; the sugar of life, poetry; and the water of life is faith.

[COPYRIGHT SECURED.]

CAUGHT IN THE ACT.—Engraved for the American Agriculturist.

"Oh, the little pickpocket! Does he not know it is wrong to steal, especially from his father?" Not too fast there, young friends. Look into the boy's face, open, frank, and honest, brimful of fun, with a spice of curiosity sharpening the look from his wide-awake eyes. Does he appear like a thief? If he were stealing, would he not be standing on tip-toe, reaching forward cautiously, keeping his eyes on his father, ready to jump back at the least motion, and having a mean, sneaking, guilty look? If his father should suddenly awake, would he sternly rebuke him? No, indeed! "Oh! you little rogue," he would shout, and giving him a playful shake, they would have a lively frolic together. The mother's looks show this; she will surprise him with "Now I've got you," and a merry laugh will follow. The artist here admirably tells the story of affection and confidence. The boy would not dare take such a liberty if his parents were cross, harsh, and tyrannical; or if he attempted to pick his father's pocket, it would be as a thief, and not in play.

Too Well Acquainted.

A gentleman holding a prominent office in Washington concluded to change his lodgings. He sent one of the waiters of the hotel where he had selected apartments

after his luggage. Meeting the waiter an hour or two afterward, he said: "Well, John, did you bring my baggage down?" "No, sir," blandly responded the sly gentleman. "Why, what's the reason?" "Case, sir, the gentleman in de office said you had not paid your bill." "Not paid my bill—why, that's singular—he knew me very well when he kept the Girard House in Philadelphia." "Well, maybe," rejoined John, thoughtfully scratching his head, "dat was de reason why he wouldn't give me de baggage." The gentleman who was of a merry turn took the joke in good part.

Eating Green Fruit.

Cholera morbus, doctors, medicine, pain, and danger—these things come very naturally after eating green apples, pears, plums, etc.; but this is not all. There are other fruits, pleasant and healthful when ripe, but more dangerous when gathered too soon. There is the fruit of the tongue. "Words fitly spoken are like apples of gold in pictures of silver," but "hasty words stir up strife." They should hang on the branches of thought until filled out with wisdom, be mellowed by kindness and love until they drop from the lips like luscious fruit, and those that speak and those that hear may feast together with

pleasure and profit. Riches, which are the fruits of labor, may make the whole life glad, but they may also be grasped after in speculation, in lotteries, at the gaming table, and in other ways; this is snatching at unripe fruit, and very few have strong enough moral constitutions to withstand the poison they contain. Thousands are ruined in body and soul every year because they "make haste to be rich" and "fall into a snare." Pleasure is the most dangerous, because the most tempting, of all the fruits of life. It ripens on every branch of experience, in just the right quantities to ensure health and happiness. It cheers the laborer at his toil, lightens the task of the student, gives sprightliness to the boy at his game, and patience to the mother in her cares. But it must not be greedily gathered from every opportunity. The disfigured and miserable victim of intemperance sought it by hastening the flow of blood through his veins, and it poisoned him; the glutton gathered it before it was ripened by appetite, and was made miserable by dyspepsia; a beautiful girl was not content with the portion which one loving heart could bestow; she lent an eager ear to flattery, gathered pleasure from every source, and found swift ruin. Think of these things as fruit time comes on, and be wise enough to profit by the lesson.

(Business Notices \$2.50 per Agate Line of Space.)

CONTENTS FOR 3 MONTHS.

JANUARY.

The Brannville Athletic Club—Moses C. Tyler
Two Rules of Perfection—Rev. O. B. Frothingham.
The Family—Mrs. E. Oakes Smith.
Excess in Recreation—Horace Greeley.
Health of College Students—E. O. Haven, LL. D.
A Letter to Little Folks—Mrs. R. B. Gleason, M. D.
Lying—Rev. Henry Ward Beecher.
Good Tools and Bad Workmanship.
 "The Schoolmaster's Poem."—Do not Swallow Grape Seeds.
 Conchology and Physiology. Faith in Medicines.
 Standing by Thackeray's Kindergarten.
 Grave.
 Diseases of the Stomach.

MARCH.

Resurrection of the Body—Rev. O. B. Frothingham.
Choosing a Wife—Mrs. E. Oakes Smith.
A Happy Old Age—Rev. Henry Ward Beecher.
Deaf and Dumb—H. P. Peet, LL. D.
Why Men Drink—Horace Greeley.
Domestic Unhappiness—Mrs. R. B. Gleason, M. D.
 The Athletic Club—Woman's Strength—The Curse that Faleth Not—Warming Railway Cars—Ulceration of the Stomach—Who Shall Take Care of the Children, etc., etc.
 The April No. will contain a discourse by Rev. E. H. Chapin, LL. D., on **The Trials of Young Men**.

This monthly is a real live, and valuable family magazine, original in character, entirely new in matter, and designed to show how human life may be made beautiful, how health may be regained, how children may be reared in health, with strong, athletic bodies, how to nurse and care for the sick, how to cook, to eat, drink, sleep, bathe, exercise, rest, and how to make the most of one's life. Its list of regular contributors is large, and embraces many of the best writers of the times. Put this monthly into the hands of son and daughter, wife and mother, husband and father, for one year, and it will do them good. \$1.00 a year. Samples 20 cents.

Every person who subscribes for 1868, and sends 25 cents extra to pay for postage, shall have a beautiful steel engraving of Lincoln at Home, size 19x21 inches, and worth \$1.00.

For 30 subscribers and \$50, we will send a Wheeler & Wilson Sewing Machine, worth \$55.

MILLER, WOOD & CO.,

15 Laight Street, New York.

American (Waltham) Watches.

The Watches manufactured by the American Watch Company of Waltham, Mass., have now been before the public for a period of twelve years, and have not only steadily advanced in reputation, but have received the approbation of the most skillful experts, as well as of railroad engineers, conductors, expressmen, and others requiring accurate, reliable, and durable timekeepers in their ordinary business pursuits.

By successive reductions during the past two years all grades of our Watches may now be bought at prices to correspond with those asked before the war, thus making them not only the best but the cheapest in the market.

Unscrupulous dealers occasionally sell a worthless Swiss watch representing it as made by us. To avoid all imposition, the purchaser should invariably demand a certificate of genuineness, signed by the Treasurer, R. E. ROBBINS.

For sale by all respectable dealers.
 ROBBINS & APPLETON, Agents,
 No. 182 Broadway, N. Y.

PARDEE'S SABBATH-SCHOOL

A new work by R. G. Pardee, A.M., full of practical instruction and suggestion in every department of the Sabbath-school. Pastors, Parents, Superintendents and Teachers will want it. For a full description send to J. C. Garrigue & Co., Publishers, 148 South Fourth Street, Philadelphia, Pa.

MY CATALOGUE of New and Interesting Plants, and New French Gladiolus, is now ready.
 GEO. SUCH, South Amboy, N. J.

GRAPE VINES

Of Large Size, for Immediate Bearing.

As we have frequent applications for vines ready for immediate bearing, we have grown a superior stock of such, including Concord, Hartford, Creveling, Ives, Rente, Alvey, Iona, &c. We will furnish one each of the above named kinds for \$10.

For further information, send 10 cts. for Catalogue and Circular.

J. KNOX,
 Box 155, Pittsburgh, Pa.

ORANGE JUDD, REV. BISHOP SCOTT, SOLOMON ROBINSON, REV. HENRY WARD BEECHER, MRS. LATRA E. LYMAN, and thousands of others, will tell you that DORY'S WASHING MACHINE and the UNIVERSAL CLOTHES WRINGER are a real success, and save their cost in clothing every year, besides saving more than half the time and labor of washing. Send the retail price, Washer, \$14, best Wringer \$9, and we will forward either or both machines free of freight, to places where no one is selling, and so sure as we they will be liked, we agree to refund the money if any one wishes to return the machines free of freight, after a month's trial according to directions.

R. C. BROWNING, General Agent,
 (Opposite Merchants' Hotel) No. 32 Cortlandt st., N. Y.

Worthy of all Farmers' Attention.

Browning's Excelsior Phosphate is without doubt the best fertilizer in the market, and is the only fertilizer that varies in its composition, according to the crop for which it is intended to be used. Pamphlets giving full particulars, furnished free of charge, by addressing the manufacturer GEO. L. BROWNING, No. 31 Market st., Camden, N. J. The manufacturer is a practical farmer.

Destruction of Insects and Cure of Skin Diseases in Animals.

CRESTYL SAPONACEOUS COMPOUNDS (Patented).

See advertisement in *Agriculturist* for Dec. 1867.
 From numerous testimonials already received, we select the following from a practical farmer in Delaware Co., N. Y.:
 "I have received the Sheep Dip, and have used it on some calves, and find it *sure death to lice*, &c. I can confidently recommend it for *destroying vermin of every description*. It gives the hair a glossy appearance, and I shall use it on all my stock." These compounds manufactured solely by JAS. BUCHAN & CO., 101 Chambers St., New York.

COLGATE & CO.'S
Fragrant Toilet Soap are prepared by skilled workmen from the best materials, and are known as the **STANDARD** by dealers and consumers. Sold everywhere.

"FIGHTING AGAINST WRONG,"
 and for
 "THE GOOD, THE TRUE and THE BEAUTIFUL."
THE
Little Corporal
 Is acknowledged by Press and People almost universally to be THE BEST PAPER for Boys and Girls ever published in this country.
 It is edited by ALFRED L. SEWELL, and EMILY HUNTINGTON MILLER.
 Volumes begin July or January. Book Not supplied.
 Terms, One Dollar a year. Sample copy sent free.
GREAT INDUCEMENTS are offered to those who wish to raise clubs.
 Address, ALFRED L. SEWELL, Publisher, Chicago, Ill.

Send Stamp for priced Catalogue of new books on

BUFFALO, N.Y. CHICAGO, ILL.

KITTATINNY.—"Superior in flavor to all others."—Ed. Agr. "There is no doubt that it is the best cultivated Blackberry known."—N. Y. Tribune. See who says so, page 74, Feb. No. Plant the BEST, plant true *Gentiana*. You can get them of the Proprietor, E. WILLIAMS, Montclair, N. J. Order early.

GRAPE VINES.

For prices, see list on page 116.
PARSONS & CO., Flushing.

Waterman's Patent Cast Iron Roll Pans

For baking, French Rolls, Cakes, Pop Overs, Corn Bread, etc. The best article in use; see editorial notice page 25 in Jan. No. of *Agriculturist*. Manufactured and for sale by the owners of said patent, HUSSELL & FLETCHER, N. Y. & P. CO., New Britain, Conn. and at their warehouses in New York, Philadelphia, Boston, Baltimore, and San Francisco.

Inquire for Waterman's Patent Bake Pans. Recipes furnished with the pans.

Dealers please send for Illustrated Circulars.

Page's Green-house Syringe, Force Pump,

Garden and Fire Engine.

New styles from \$10 to \$12 each. For Florist, Fruit and Vine Grower, Market Gardener and Housekeeper, should send for Circular. It will pay!

N. E. P. P. CO., Danvers, Mass.

FRANKLIN
BRICK MACHINE.

Justly celebrated for perfect simplicity, great strength, and immense compressing power, is GUARANTEED, with eight men and two horses, to self-temper the clay and make 3,000 to 3,500 elegant bricks per hour. J. H. HESICK, Proprietor, No. 11 Broadway, New York, Jan. 18.

CRAWFORD'S HAND GARDEN CULTIVATOR

Warranted to save the labor of four to six men. Send for Circular. BLYMYER, NORTON & CO., Manufacturers, Cincinnati, O.

Fort Edward Collegiate Institute.

Spring term, March 24th. Sixty dollars for board, fuel, washing, with common English branches. Best sustained Boarding Seminary for ladies and gentlemen in the State. Brick buildings, three teachers. Address, for Catalogues or rooms, J. E. KING, Jr., Fort Edward, N. Y.

Advertisements, to be sure of insertion, must be received **BEFORE** the 5th of the preceding month.

TERMS—(cash before insertion):

Ordinary Pages, \$1.50 per line. Less than 4 lines, \$5.
Open Pages (open without cutting), \$2 per line.
Business Notices—\$2.50 per line of space, each insertion.

AGRICULTURAL AND HORTICULTURAL
IMPLEMENTS, of the latest and best improved, and of every variety required for the FARM and GARDEN—WHOLESALE and RETAIL. These are manufactured mostly by ourselves, and are fully warranted in all respects. Catalogues furnished on receipt of stamps.

R. H. ALLEN & CO., 159 and 191 Water-st., NEW YORK.

SEED POTATOES

New English Varieties.

Wheeler's Milky White.—A Seedling from the Fluke, a second early variety of delicious flavor and in color as white as milk, remarkable for its freedom from disease, highly prized by English cultivators.

Mona's Pride.—A very early, Kidney Potato—of medium size, and of excellent quality—fine for forcing.

British Queen.—Early and of fine quality. In consequence of the limited supply of the above, we offer them in *One Pound* lots, which will be mailed to any address upon receipt of One Dollar for each package.

All orders for the following varieties received previous to the 20th of March, will be filled at the prices quoted, after which prices will be subject to variations in the market.

GEO. W. JONES, A. M., Principal.

Prang's American Chromos.

IN OIL AND WATER COLORS.

FRANG'S AMERICAN CHROMOS are fac-simile reproductions of oil and water color paintings; so faithfully and skillfully done that it requires the experience of an expert to detect the difference between them and the originals.

For every purpose of decoration—for parlors, sitting-rooms, drawing-rooms, nurseries, or chambers—nothing so exquisitely beautiful as these Chromos can be obtained for the same amount of money. No other ornaments of the same cost are so admirably calculated to adorn a home; to cultivate a love for Art among the people at large; to brighten up the dwellings of every class of our citizens; and to teach the rising generation, by their silent yet redounding influence, to love the beautiful in Art and in Nature. Hitherto, Art has been accessible only to the few, and the few have been content to admire it in its original form, but chromo-lithography has changed all that, and brought exquisite paintings within the reach of every family. It is doing for Art what the printing-press did for Literature. Let no family, henceforth, be without a few classical books, and one or two masterly paintings. Both should be regarded as indispensable to complete a home.

Send for "FRANG'S CHROMOS: a Journal of Popular Art" and see what we have done and are doing to popularize Art. It will be sent to you free.

L. PRANG & CO., Boston.

HEXAMER'S PRONG-HOE.

The best hand-cultivator ever invented. It saves half the labor of hoeing, and does the work better than any other tool. Every farmer and gardener should have it. Price, per piece, \$2.50; per dozen, \$24.00. Circulars sent on application. Address,

REISIG & HEXAMER,
New Castle, Westchester Co., N. Y.

NEW STRAWBERRIES.

"Charles Downing." This fine variety was raised by J. S. Downer, of Todd Co., Ky., and is considered the best new variety known, by such men as Charles Downing of New York, Prof. Purdy, Horticultural Editor of American Agriculturist, Mrs. Meacham, Editor of Gardeners' Monthly, and others. Charles Downing thus fruited this variety last season says it is certainly very promising, and from what I have seen this season, think it will prove an acquisition, and for vigor, productive richness, and quality, combined, think it superior to any new sort, plants \$1, doz. \$25; 100, \$250; \$500, 1000. The following have been selected from 100 varieties, all are native seedlings, very promising, except Perpetual Pine, Juneana, and President, these are from France, Globe, very large, silend, \$2, doz. \$10, 100.

Heaven Seedling, extra fine, \$2, doz. \$10, 100.

Gloves Perpetual Pine, everbearing variety, imported direct from Mr. Glozier, by me last year, said to be large, and everbearing, \$2, doz. \$10, 100.

Romeys' Seedling promises to be much more valuable than Harrison, more productive, and fruit, large, bright scarlet, sweet, \$2, doz. \$10, 100; \$15 per 1000.

Harrison, a splendid new variety, fine, \$2, doz. \$10, 100.

Market, large, productive, very early, \$2, doz. \$10, 100.

These 6 varieties, one doz. each, \$6.00.

Great Elbowman, immense size, sweet, \$1, doz. \$4, 100.

Juneana, strongly recommended, very large, \$1, doz. \$4, 100.

Darand's Seedling, better than Juneana, \$1, doz. \$4, 100.

Edward II of Dr. Macale in size, \$1, doz. \$4, 100.

Siliger Seedling, large, productive, firm, \$1, doz. \$4, 100.

Black, large, novel color, nearly black, \$1, doz. \$4, 100.

Ella, large, earliest berry known, firm, fine, \$1, doz. \$4, 100.

Philadelphia, a promising variety, very early, \$1, doz. \$4, 100.

Lincoln, a magnificent berry, \$1, doz. \$4, 100.

These nine varieties, one doz. each, \$3.00.

White Alpine, sweet enough without sugar, \$1, doz. \$3, 100.

White, a great bearer, continuing all season, \$1, doz. \$3, 100.

Mead's Seedling, a very fine, large variety, \$1, doz. \$3, 100.

This entire collection, including Charles Downing, \$15.00.

Address Wm. S. CARPENTERS, 156 Bead-st., New York.

THE new WIRE TRELLIS will last a lifetime. If you cultivate a vegetable or flower garden, write for an illustrated Circular giving sizes and prices.

WILLIAM W. WILCOX, Middleton, Conn.

The Impressions are as sharp and true as those of the photograph. The advantages of this machine are:

- 1st. It performs many times as much labor as can be done by hand.
- 2d. No hand work, however painstakingly and slowly done, can equal it.
- 3d. It does not require a highly skilled workman.
- 4th. It is adapted to all kinds of work and can be applied to any surface, flat, or curved.
- 5th. The machine is substantially made of vulcanized rubber, with brass side-plates so simple and durable that it will last for years without getting out of order.
- 6th. By an improvement made last year the figure can be carried close to the ends of a panel.
- 7th. The pattern plates are now reinforced by a patent backing, which prevents their breaking.

This machine has taken the first Premium at the American Institute Fair, this year. See Report of Committee. Also, see *Scientific American*, August 3, 1887. For Circulars and further particulars, address

HEATH, SMITH & CO., 44 Murray Street, New York.

AMERICAN INSTITUTE FAIR, Oct. 25, 1887. AWARDED

HENRY SEYMOUR & CO., New York.

The only Premium Medal for the best SHEEP SHEARS, *Pruning and Hedge Shears*. These SHEEP-SHEARS are warranted to be far superior to "Williamson's" in durability and finish. Sold by all Hardware and Agricultural Houses.

American Agriculturist for Jan. 1885, says: "We have hitherto been too much dependent upon England for our best cutters, and sheep shears were no exception. Hardly willing to trust, without the test of use, our own favorable impression in regard to the excellence of these sheep shears, made by Henry Seymour & Co., of this city, we have submitted them to the judgment of practiced sheep shearers, who are much pleased with them, and to experts in steel manufactures, who pronounce an unqualified approval, confirming us in our own opinions."

LAMB KNITTING MACHINE

PRICE REDUCED TO 58 Dollars.

—It sets up its own work, knits all sizes, narrows and widens, knits the heel into the stocking, and narrows off the toe completely—producing all varieties of knit goods. It is simple, durable, easily operated, and guaranteed to succeed in the hands of every purchaser. Send stamp for Circular and sample stocking.

JAMES J. H. GREGORY, Marblehead, Mass.

A GREAT ANNOUNCEMENT!!!!

Will be Commenced in No. 16, Ready Feb. 15th, of

THE NEW YORK WEEKLY,

The Best Story and Sketch Paper of the Age, a Thrilling Tale, entitled

THE WITCH-FINDER;

OR,

THE HUNTED MAID OF SALEM,

BY LEON LEWIS,

AUTHOR OF "THE SILVER SHIP," "THE WATER WOLF," "SYDIA, THE JEWESS," ETC., ETC.

A thoroughly authentic history of Salem Witchcraft has yet to be written. In the books treating of this subject, the atrocities that were perpetrated by the Witch Testers were classed as almost pardonable offenses, because committed under the delusion that the victims were gifted with supernatural powers, and could at will afflict any person with the most direful physical and mental ailments—such as blindness, deformity, or insanity. In those days every person who suddenly became ill, at once proclaimed that he was bewitched, and began recalling to mind the female on whom he had last looked, and who, it was thought, had prostrated him by the power of Witchcraft. The suspected party, as was natural, generally proved to be some unfortunate woman against whom the husband had long harbored a spirit of un-friendliness. The relatives of the sick person were at once summoned; after listening to the story of the individual supposed to be bewitched, they would proceed in a body to the dwelling of the unsuspecting victim, drag her forth, publicly accuse her of Witchcraft, in having afflicted their suffering relative, and make her submit to

The Witch-Finder's Test.

Tears and entreaties were of no avail; the expositions of friends only made matters worse by leaving them open to suspicion, and it soon happened that in endeavoring to shield the unfortunate victim from the fury of the expectant multitude, even the friends of the supposed witch were compelled to unite in the tortures of

The Witch-Finder's Test.

These tests were as numerous as they were atrocious and dishonest, and frequently resulted in the death of the victim. When proven guilty of Witchcraft, death by the most cruel means was of course the sentence; but it was not a rare occurrence for

The Witch-Finder's Test

to put an end to the victim's sufferings by death, just as she was about to be declared innocent.

At this distant day, and in this age of enlightenment, there will be found many who will discredit the following brief description of one of the many tests resorted to by

The Heartless Witch-Finder.

The Salemites believed that it was impossible to drown a witch—that if thrown into a river, she would certainly be able to make her way to the shore. Acting upon this belief, when a woman was suspected of Witchcraft, she would be compelled to undergo the

Witch-Finder's Drowning Test.

She would be dragged to the nearest river, and plunged in at a considerable distance from the shore. In case the woman succeeded for a time in keeping her head above the surface of the water, that was considered positive evidence that she was a witch, and she would be stoned to death as she struggled with the remorseless waves. In this test the only proof of the woman's innocence of Witchcraft was that she could not swim, and therefore sank to rise no more! Innocent or guilty, it was death in either case! By drowning, she proved herself innocent; but if it appeared probable that she could save her life by swimming, she was stoned like a cat until she drowned.

Even crueler more atrocious than this put in practice by

The Witch-Finder.

Private quarrels and ancient grudges were avenged by accusing innocent people of Witchcraft. Young wives were ruthlessly torn from loving husbands, accused before the gaping, ignorant and superstitious populace,

Branded as Witches, and after being marched through the town, that everybody might look their last upon the

Female Demons,

the terrified women were given over to the villanous Witches who had achieved notoriety as

Witch-Finders.

The remarkable story which is soon to appear in the

New York Weekly,

is a reliable expose of the atrocities enacted in the

Days of Salem Witchcraft.

The tale is founded on authentic records and data, and is entitled

THE WITCH-FINDER;

OR,

The Hunted Maid of Salem.

The plot of the story is original, although it has for its basis an accurate account of the cruelties that were perpetrated during the period of

Salem Witchcraft.

It should be borne in mind that in No. 16 of the NEW YORK WEEKLY will be commenced "THE WITCH-FINDER; OR, THE HUNTED MAID OF SALEM." The New York Weekly is for sale by every News Agent. Price Six Cents per copy. Specimen copies sent free.

Among the principal characters portrayed in this exciting story is

The Witch-Hunter.

The most disreputable person in Salem, at the time of the Witch-hunting mania, was a man named BOARDMAN, who had achieved a devilish notoriety as a Volunteer Accuser, a Witch-Finder, or Witch Discoverer. This heartless miscreant practiced various ingenious and under pretense of distinguishing a witch from an innocent person, such as drawing blood, saying the Lord's Prayer backwards, etc.

The Hunted Maiden.

Another interesting personage of those times was HESTER WYNNOCK, the daughter of a Colonial merchant—a beautiful and noble-spirited girl, who the villain BOARDMAN persecuted with his attentions, and afterwards hunted as a Witch.

The White Angel of Salem.

A third and most remarkable personage of those dark days was a pious and religious woman who appeared in Salem when the delusion was deepest. She possessed the aspect of a young lady; but a strange peculiarity was noticed in her appearance—she was strangely white, and her skin shone so brilliantly that many supposed her to be an angel. She went about doing good, opposing the Witch-Hunters, releasing prisoners, helping widows and orphans, etc.

Whoever would have full particulars concerning these and a score of other inhabitants of Salem, in the days of Witchcraft, read this thrilling and beautiful narrative just drawn from the historical collections of Massachusetts, and entitled

THE WITCH-FINDER;

OR,

The Hunted Maid of Salem.

By Leon Lewis.

Which will be commenced in No. 16 of

The New York Weekly.

The great success of the NEW YORK WEEKLY is in a measure due to the scrutiny exercised in compiling the contents, so that the slightest offensive word or passage must be avoided. Heads of families, fully aware that we expunge from our manuscripts every expression that might contaminate the young, present

The New York Weekly

to their wives and children, fully confident that its teachings will have a beneficial effect, and that its stories, while they inculcate good morals, also exhibit the punishment that must attend vice.

The contents of

The New York Weekly

are varied, to suit the popular taste; they are instructive, entertaining, and amusing. The thoughtless will find in

THE NEW YORK WEEKLY

subjects that will induce reflection, the knowledge seeker will be edified and learn the serious and peculiar to various parts of the world, while the humorously inclined can always find in the quaint writings of JOSEPH BILLINGS, PHILANDER BOSTWICK, MARK TWAIN, JOHN Q. ILL and other humorists, something that will provoke merriment and laughter.

As we have no space to particularize, at great length, the numerous features of THE NEW YORK WEEKLY, we will just mention some of the standing attractions:

ANSWERS TO CORRESPONDENTS.—A department in which the editor indulges in familiar chat with his correspondents, replies to various queries put to him, and disseminates information that is of the greatest popular interest.

THE KNOWLEDGE BOX.—In this column will be found Domestic Recipes, Scientific and Practical Hints to Farmers and Gardeners—in fact, suggestions that will prove useful to all classes of society.

TREASURY OF INTEREST.—The important events of the world are epitomized in this column, and their essence given in pithy sentences.

LESSONS IN GRAPHS.—This department is entirely devoted to articles of a humorous nature, and it forms an excellent dessert to the mental feast which the columns of THE NEW YORK WEEKLY contain every week.

The above are the regular departments of

THE NEW YORK WEEKLY,

wholes which we have

SKETCHES OF EVERY DESCRIPTION.

LOVE SKETCHES.

SKETCHES OF ADVENTURE.

SKETCHES OF BORDER LIFE.

SEA SKETCHES.

With such attractions, who can wonder that

THE NEW YORK WEEKLY

is considered

THE BEST LITERARY PAPER PUBLISHED.

THE AMERICAN FRUIT CULTURIST,

BY JOHN J. THOMAS.

You never saw so great a curiosity!!

Jno. S. Collins' Small Fruit Nursery at your Post-Office.

(Business Notices \$2.50 per Aerate Line of Space.)

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY HAVE RECEIVED TWO FULL CARCOES OF THE FINEST NEW CROP TEAS.

22,000 HALF CHESTS by ship *Golden State*.
12,000 HALF CHESTS by ship *George Skotton*.

In addition to these large cargoes of Black and Japan Teas, the Company are constantly receiving large invoices of the finest quality of Green Teas from the Moyaoe district of China, which are unrivaled for fineness and delicacy of flavor.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st. The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d. The Dealer makes large profits upon the foreign exchange used in the purchase of Teas.

3d. The Importer makes a profit of 30 to 50 per cent, in many cases.

4th. On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1000 to 2000 packages, at an average profit of about 10 per cent.

5th. The Speculator sells to the Wholesale Tea Dealer in lots at a profit of 10 to 15 per cent.

6th. The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th. The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th. The Retail Dealer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these eight profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cent each, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Tea at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

Some parties inquire of us how they shall proceed to get up a Club. The answer is simply this: Let each person wishing to join in a Club, say how much tea or coffee he wants, and select the kind and price from our Price List, as published in the paper in our circulars. Write the names, kinds, and amounts plainly on the list as seen in the Club Order published below, and when the Club is complete send it to us by mail, and we will put each party's goods in separate packages, and mark the name upon them, with the cost, so there need be no confusion in their distribution—each party getting exactly what he orders, and no more. The cost of transportation the members can divide equitably among themselves. See club-list in Jan. No. of this paper.

Parties sending Club or other orders for less than thirty dollars had better send Post-office Drafts or money with their orders, to save the expense of collections by express; but larger orders we will forward by express, to collect on delivery.

Hereafter we will send a complimentary package to each party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for Clubs less than \$30.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Canton House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OOLONG (Black), 70c., 80c., 90c., best \$1 25 lb.
MIXED, (Green and Black), 90c., 80c., 90c., best \$1 per lb.
ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.
IMPERIAL (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
GUNPOWDER, (Green), \$1.25, best \$1.50 per pound.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound. Hotels, Saloons, Boarding-houses, Keapers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNER COFFEE, which we sell at the low price of 20c. per pound, and warrant to give perfect satisfaction.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of the

GREAT AMERICAN TEA COMPANY,

Nos. 31 and 33 VESEY STREET.

Post-Office Box, 5643, New York City.

Evidence After Two Years' Trial.

Treasury Department,
Fourth Auditor's Office, Washington, Dec. 31, 1867.
GREAT AMERICAN TEA COMPANY,
31 and 33 Vesey Street, New York.

The accompanying list completes the second year of the evidence of this Club, and what I said to you one year ago, I can say again now, and that is, that the Club has been highly gratified with the goods received of your house, and is abundantly satisfied that better articles and lower prices can be obtained there than at any other "house" with which we are acquainted.

If two years' experience is any criterion for judgment, then the public can rest satisfied that "THE GREAT AMERICAN TEA COMPANY" is no humbug.

Very respectfully yours,

L. CASS CARPENTER.

NOTICES OF THE PRESS.

From the American Agriculturist.

THE GREAT AMERICAN TEA COMPANY.—TO QUERIES:—Before admitting their advertisement, we learned that a large number of our clerks and others had for several months been buying their Tea and Coffee from this Company, without its being known who they were, and that they had been highly pleased with their purchases, both as to quality and price, and were all recommending their friends to the same course. As we have published the advertisement for many months, and received no complaints, we conclude "there is no humbug about the establishment."

N. B.—All villages and towns where a large number reside, by Clubbing together, can reduce the cost of their Teas and Coffees about one-third (beside the Express charges), by sending directly to "The Great American Tea Company."

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *hogs or imitations*. We have no branches, and do not, in any case, authorize the use of our name.

Post-Office orders and Drafts, made payable to the order of "Great American Tea Company." Direct letters and orders to the (as below, no more, no less)

Great American Tea Company,

Nos. 31 and 33 VESEY-ST.,

Post-Office Box, 5,643, New York City.

EXTRA NOTICE.

With the greatly increased interest in Small Fruit Culture, there has arisen a large demand for vines and plants of Extra Size and Quality for Immediate Bearing. Young America is impatient of delay, and the aged desire to "eat the fruit of their doings."

To meet this praiseworthy demand, we have grown a stock of vines and plants of largest size and best quality, including Grapes, Strawberries, Raspberries, Currants, Blackberries, Gooseberries and Rubus.

We direct attention to advertisement of "Grape Vines of Large Size," on page 109 of this No. of *Agriculturist*, to Mr. Meehan's article on 28th page of our Catalogue, and especially to our "Extra Vine and Plant Circular." Sent with Catalogue to all applicants for 10 cts.

J. KNOX,

(ESTABLISHED 1866.)

Elizabeth, New Jersey.

One hundred acres closely planted with a fine stock of Dwarf and Standard Pears, Apples, Peaches, Cherries, Grapes, and Small Fruits.

Also, a very large and extensive assortment of Shade Trees, Evergreens, and Shrubs, such as are desirable for planting in Cemeteries, Parks, Lawns, &c.

Particular Attention given to small orders. Catalogues forwarded on application.

DAVID D. BUCHANAN,
Successor to Wm. Reid.

NEW CROP OF GARDEN PEA.

The following new and select varieties sent by mail, post-paid, on receipt of price. See *Ag. Jour.*
Carter's First Crop, the earliest in cultivation..... 90 cts.
Dickson's First and Best, extra early..... 90 cts.
Early Caracoles, extra early..... 50 cts.
Improved Early Dan O'Rourke, extra early..... 50 cts.
Monk's Thumb, one foot high, very early..... 90 cts.
English Tom Thumb, one foot high..... 10 cts.
McLean's Little Gem, 1 foot, very early and sweet..... 10 cts.
McLean's Advance, very early and fine..... 10 cts.
McLean's Princess Royal, extra quality..... 65 cts.
McLean's Epicurean, delicious flavor..... 10 cts.
Drew's New Dwarf, 1 foot, very prolific..... 10 cts.
Yorkshire Hero, extremely prolific and fine..... 10 cts.
Laxton's Prolific Long Pod, extra, very scarce..... 10 cts.
Also many other standard sorts, and all the novelties of the season, both in vegetable and flower seeds, for which see our new Illustrated Catalogue of 10 pages, sent by mail on receipt of 25 cts. to receive customers free on application. HOVEY & CO., 53 North Market-st., Boston, Mass.

RHODODENDRONS

Grafted plants of all the best hardy sorts at much lower prices than ever before.

PARSONS & CO., Flushing, N. Y.

EVERY FARMER WANTS IT. Saves half the time in planting. Sows for 100 ft. in half a day, will last years. Light and simple. A child can use it. Will not get out of order. Used any hoe handle; taken off in a minute. Sets the grains itself, drops them exactly where wanted, in plain English. Sizes, No. 1, 75 cts.; No. 2, \$1; plants 100 to 600 hills without rest.

TRY IT. Sent by Express on receipt of price. Send for Circular. HARPER & PATTERIDGE, Patented, 200 Pearl-st., New York.

FOR SALE.—A magnificent property on the St. John's River, East Florida, possessing almost every desirable characteristic for a large estate. Apply to A. MULLER, JR., 5 Pine-st., New York.

CHERRY LAWN FARM.

Our Descriptive Catalogues of Strawberries, Raspberries, Blackberries, Currants, Gooseberries, Grapes, Rhubarb, Asparagus, Seed Potatoes, Vegetable Plants, (collied, hot-bed, and open ground), mailed to all on application. All intruding us with their orders will have them faithfully executed in every respect.

D. H. BROWN, New Brunswick, N. J.

PATENT OFFICES.

Inventors who wish to take out Letters Patent are advised to counsel with MUNN & CO., Editors of the *Scientific American*, who have prosecuted claims before the Patent Office for over Twenty Years. Their American and European Patent Agency is the most extensive in the world. Charges less than any other reliable agency.

A Pamphlet, containing full instructions to Inventors, is sent gratis.

25¢ A Handsome Bound Volume, containing 1500 Mechanical Engravings of the most useful and valuable Combs, with Hints and Receipts for Mechanics, mailed on receipt of 25c.

MUNN & CO., 37 Park Row, New York.

RURAL IMPROVEMENTS.

Robert Morris Copeland, author of *Country Life*, furnishes plans and advice for laying out Public and Private grounds of every description. Refers to John M. Forbes, Nathaniel Field, Boston, Esq., and O. M. Hubbard, Philadelphia, Pa., G. T. Fletcher, Indianapolis, Ind.

Office 42 Barristers' Hall, Boston, Mass.

MAPLE SUGAR! MAPLE SUGAR! COOK'S EVAPORATOR the most successful sugar pan the world. Is warranted to save at least forty per cent. in fuel, labor, and quality of syrup and sugar. Send for Circular. BLYMIE, DAY & CO., Mansfield, O.

SEEDS OF EVERY DESCRIPTION FOR THE FIELD, GARDEN, AND ORCHARD. GROWERS, and all who desire the best of every kind grown in Europe and America. Catalogues furnished on receipt of stamps.
R. H. ALLEN & CO., 189 and 191 Water-st., NEW YORK.

THE GREAT INSECT DESTROYER!

See Circulars of N. E. Portable Pump Co., Danvers, Mass.

PERCHERON HORSES.—Drawn from Life and Engraved for the American Agriculturist.

The name "Percheron" is now given to the best bred horses of the province of Perche, in France, where, as also in Normandy and Flanders, a class of heavy, powerful draught horses has been bred for years with great care. The origin of the breed is veiled in the obscurity of tradition, but it is supposed that its superior qualities are, in a measure at least, due to an intermixture of Barb blood. The qualities of the breed are such as adapt them preëminently to farm work. They are large, compact, very powerful animals; easily kept, of great endurance, and considerable speed, they show a remarkable grace and ease of action, and besides are noted

for docility and kindness of disposition. It is many years since horses of this breed were first imported into this country. Wherever they were kept they left their mark upon the stock of the country in a way to demonstrate their value. Yet, as they do not win laurels on the race-course, and thousands of dollars at trials of speed and bottom at our agricultural fairs, but have simply been of value to the farmers and to the breeders of draught horses, they have never been introduced and bred as they should have been, and are not generally known.

Several recent importations attest the growing interest taken in the Percherons. The

French Government and stock breeders are now fast becoming fully awake to the superiority of the noble race of horses which has its home upon the soil of France. We are more and more convinced that one great need of our agriculture is the possession of such a class of horses as the cross with the Percheron will give us. We see something of a similar strain of blood in the Kanuck horse, which in a small compass possesses many of the excellent points and characteristics of the Percheron. The subject is one on which we shall hereafter have more to say, as the publishers will soon announce a new work upon the Percheron horse.

AMERICAN AGRICULTURIST.

NEW-YORK, APRIL, 1888.

April is one of the most indefinite months; March work holds on into it, even though May weather prevails. Besides, there is almost always a great deal of work which inopportune rains will postpone and again postpone, quite into next month. There should be an early division of work, thus:—dry soil work, rainy day work, and work for fair days when the soil is wet; this makes three good divisions. Nothing should interrupt the work in the field and garden while the soil is in good condition for working. With proper diligence all that needs to be done indoors, or that can be done on rainy days, or while the soil is too moist to work, may be without infringing upon the good days for field work. If plans are not well matured for the summer campaign lose no time before forming them. If there are seeds to buy, tools to provide, or anything of that kind to do, delay not. If we begin the season with good "help," good teams, good tools, good seeds, all the manure we can get, and the best plans we can make, after doing all we possibly can we may rely upon Providence for sunshine and showers and fruitful seasons. Last year, amid the parched acres of the Interior, the fields of those whose drainage and deep tillage had been thorough, showed for miles as green oases in a barren desert, and at the East, where all was wet, it was undrained fields and those of shallow soils that uniformly produced the poor crops.

Hints about Work.

Review what was said in the March number with regard to winter grains, grass, sowing, and the working of wet soils.

Double Cropping.—Land to be suited for raising two crops in one season must be rich, in good till, and free as possible from weeds—in fact, like a good garden. Early potatoes, peas, onions, early cabbages, or any early soiling crop, may be followed by cabbages, rutabagas, common turnips, pickles, etc. Onions will leave the ground for carrots, which should have been sowed at the last hoeing between the rows, as directed in a "basket item," and cabbages may be set out before the potatoes are dug.

Animals.—Let stock of all kinds have frequent earthing, and some hours of sunshine daily. Only at the South will the grass be forward enough to be pastured without danger to the crop. The temptation will be great to turn cattle upon the fresh meadows in case forage is scarce, but it will be much better both for the stock and the pasturage to feed a month longer, perhaps, on corn-stalks. The first lands that are fit to turn stock upon are unrelieved bogs, where the coarse grass growing in tussocks has been burnt off. Such grass is sweet and juicy early in the spring, and eaten with zest after the dry fodder of winter, but it soon becomes wiry and hard and will be refused by the stock. If fed off close when it first starts, it will keep on growing and furnish considerable feed. Nevertheless such land is very unprofitable property.

Horses shedding their coats may have a quart of oil-mead fed to each daily with cut feed or on a peck of carrots. Feed work-horses well. If kept steadily at work, calculate to feed so well that they will not fall off at all in flesh. Daily thorough grooming is worth four quarts of feed a day at this season, even for farm horses. Mares near foaling must be well fed, relieved from severe labor, and as their time approaches give roomy quarters in loose boxes. A box 10 feet square is none too large. A slightly loose condition of the bowels in breeding animals is always favorable, and should be induced by feeding roots, oil-cake or flaxseed.

Oxen.—Feed in proportion to work required, and often, give long noonings, and a chance to feed but not to fill themselves. Cattle, like all ruminating animals, eat fast and do their chewing afterwards. An ox that is put to work with his pannel full of unmasticated food is lazy, at least, and probably more liable than otherwise to be hurt by hard work.

Cows and Calves.—Refer to last month's hints; we have little to add here. Calves that are beginning to nibble grass a little may be tethered by the fences, where the grass starts green and sweet, and will thus learn to pick up a good living as soon as turned to pasture. Never let the scours run a day.

Sheep.—Take extra care of the lambs; if stunted in their earliest growth they never catch up. The flock will need close watching to see that no ewes become gargely and their lambs lack milk, that none refuse to own their young, and that no lambs are hurt, or sick. Provide fresh water regularly, if not constantly, and by no means neglect salt.

Swine.—See hints for previous month. If the stock kept is not bred upon the farm, look out early for such pigs as you will need. If these can be had bred of full-blood sires, by all means secure them; they grow faster and fatten more easily.

Poultry.—There are some useful hints in the body of this number to which we refer the reader. Several painful diseases are apt to attack fowls in wet Springs, of which the worst are the Roup, and that disease so close akin to it as to be confounded with it, Swelled-head. Both are brought about by uncleanly apartments, and both are highly contagious; although the previous preparation of the system by exposure to wetness and filth seems to be an almost essential condition. A cold will run into roup if any rumpy fowls are about the yard. In bad weather, give an iron tonic, say a teaspoonful of tincture of iron, wet up in a quart of Indian meal, to a flock of twenty. About a tablespoonful of red pepper may be mixed with it to good advantage. In fact, this is one of the best preventives of disease, encouragements to laying, and promoters of health, which the poultry breeder can use. Taken early, these diseases may be cured by stimulants and cleanliness, but after the first stage they are usually fatal. Coops for hens and chickens should be placed on clean turf, where no chickens have been, at least since early last spring. Old coops should be well cleaned and whitewashed, and the water furnished to chickens should be so covered that they cannot foul it nor step in it, and protected from the dirt which the old hen throws in all directions by her scratching. We believe absolute cleanliness, on fresh ground, to be a perfect prevention of the gapes. Turkeys hatch and care for their own young best. Ducks' eggs, however, ought always to be put under hens. Keep ducks shut up until 8 o'clock every morning, or until all have laid. They lay an egg a day, if well fed, and will steal their nests and hide them where they are hard to find, if allowed their freedom. When the eggs are regularly removed they will not want to sit, but keep on laying until midsummer. Otherwise they sitas soon as they have a nest full of eggs.

Miscellaneous Work.—For hints about farm roads, fences, picking up stones, etc., see March number.

Buildings.—As soon as the weather is warm and settled, open and clear out cellars, both in house and barn, whitewash thoroughly, stop rat holes and cat holes. Roots still on hand may be put in barrels or boxes, that the bins may be cleaned. Outside painting may be done now, and a better surface be formed than if the work be done when the wood is thoroughly dry so that the oil will strike in.

Draining may often be done in the spring better than at any other season, and spring draining has this great advantage: the filling has all the summer to settle, and there is much less danger of the surface water washing in and gaining direct access to the tiles than when the draining is done in the fall. On this account it is advisable to do the draining on side hills, and where early in spring much surface water flows, at the present season of the year, after the heavy spring rains have passed.

Barn-yard Manure and Composts.—Where manure has any value in the estimation of the farmers, nobody has enough. Nevertheless, the prevailing notions about it are so crude that few take the pains they should to increase their manure both in quantity and quality. Manure the land well, or not at all. It does not pay to put on a sprinkling and get half a crop. Manure will secure a reward for labor that can be gained in no other way. Begin

the season by making arrangements for saving manure, and thoroughly composting it with muck, sods, or with other vegetable matter later in the season. Manure for use on land intended for rutabagas, or other crops sowed in summer, should be put in compost heaps and worked over once or twice before it is used. Poultry house manure mixed with soil or muck should be frequently worked over, and made fine for use upon corn in the hill.

Liquid Manure.—The leachings of the barn-yard, which ought always to flow into a tank especially prepared for them, are among the most valuable additions to a compost heap; not a particle of it should be allowed to waste, or wash away when rains cause an overflow. It will pay well to have a sprinkling cart to carry the liquid upon the lawns or fields, and it is especially useful upon the garden. During a moderate rain, or in showery weather, is the best time to apply it on all drained soils, where the water goes through, not over the surface.

Commercial Fertilizers.—Purchase with caution. Bones as bone-dust are less likely to be adulterated than as superphosphate. Guano (Peruvian No. 1) is a safe article to buy of an honest dealer, who buys of the Government agent. The more hands it goes through the more probability there is of its being adulterated. Fish guano is excellent and reliable; we have as yet learned of no frauds connected with it. Castor Pomace is to be had in small quantities and is excellent. Land plaster is little subject to fraud. Leached ashes are often adulterated with coal ashes, but this fraud is easily noticed. Get along without buying manures, if possible, but if you sell either hay or straw, be sure to make good the wrong you do the soil by spending all you get for manure of some sort, and keep the soil improving.

Spring Grains.—Wheat and Barley should be pickled in a strong brine and dried with lime before sowing, to destroy the smut. Sow as early as the ground is brought into fine order, using about 5 to 7 pecks of wheat, 2 bushels to 2½ of barley, and 2½ of oats. The later the grain is sowed the more seed should be used. Heavy, plump seed, free from weed seed, is of prime importance. No rank, heating manure should be used, but fine compost, or applications of commercial fertilizers, such as 100 to 250 pounds of guano to the acre, or 300 to 500 pounds of bone-dust for wheat or barley, and leached ashes, wood ashes, or gypsum, for any spring grain. Nitrogenous manures make oats run to straw.

Peas.—This crop should be sown early. In light soils put the seed in deep. It should go upon soil manured last year, and free from weeds. A common practice is to scatter the peas by hand liberally in every third furrow. The furrows should be not more than four to six inches deep, the depth depending on the soil. Broadcast sowing and drilling are more commonly followed, the latter practice being usually preferred on warm ground. Peas and oats sowed together is a favorite crop with many good farmers, but as nearly a full crop of each may be produced, the land must be mellow and rich.

Root Crops.—Sugar beets, mangels, parsnips, and carrots, may be sown as early as the ground can be well prepared. These crops can hardly have too rich or well-worked soil, yet they will reward labor on soil which is far from being either as rich or as mellow as it might be. Be sure of good seed. Sow in straight drills so far apart as to allow of horse cultivation. Carrots may have the drills closest, but these should be at least 2 feet apart; 30 inches is none too far for the other roots named. Roots require a good deal of labor, but it is well spent.

Roots.—The earliest varieties are the ones for early planting. There is perhaps nothing better than Early Goodrich, or than the Sebce; the Dyke-man is common in most parts of the country, and the Early June may be had anywhere, and is very good. Plant good-sized seed, cutting the largest potatoes, and aiming to have the pieces fully as large as hens' eggs. Let the cut pieces dry a day or two before planting. Plant close, one piece in a place, and not less than 4 inches under ground on dry ground. Cover with a plow, riding up a little over the rows, and lay all flat as soon as the plants get above ground, with a wooden-toothed harrow, an iron one on its back, or with a bush harrow.

Work in the Horticultural Departments.

As a matter of convenience we arrange these notes under different heads, though we are well aware that many have but one garden for small fruits, vegetables, and even flowers. It is better to grow those things so than not at all, but it is on many accounts preferable to have separate compartments set off for the fruit, kitchen, and flower garden. The manuring and frequent working of the soil, so necessary to the production of the best vegetables, is not practicable where permanent beds of fruits are in the way, and while we appreciate the love for flowers that will have them under every disadvantage, we much prefer to see the onions grow at a distance from the tulips. Enthusiastic cultivators are often in a hurry to be at work with the first mild days of spring. It is always best to wait until the soil is in "working order" and will crumble rather than clod when turned by the plow or spade. Work must often be pushed, but never badly done; better do less and do it well.

Orchard and Nursery.

The present custom of packing trees in boxes has some advantages over the old one of baling with straw, but with all the care those that are sent a long distance are liable to detention in transportation and it will often happen that the trees, when opened, have a most unpromising look, the bark being badly shrivelled. In this case do not put the trees into water, but bury them, root and branch, in the soil. After a contact of a few days or a week with the moist soil, they will, unless very badly injured, come out as good as new. The land should be prepared, and everything should be ready for

planting the trees as soon as they are received. Cut injured roots smooth and shorten the tops. Make a hole broad enough to allow the roots to be spread; throw on some fine soil and work it in among the roots with the fingers, so that no hollow places will be left; put on more soil and press it down with the foot, and the tree will not need

staking to support it, although a stake to each tree is very useful in laying out the ground before the tree is planted, and afterwards in enabling its position to be more readily seen in cultivating.

Grafting is to be done upon the plum and cherry before the buds have started. Other trees may be worked after the buds have swelled.

Root-grafts and Cuttings are to be planted in a rich, mellow bed as soon as the soil can be prepared.

Seeds of all kinds for raising young nursery stock should be sown as soon as possible.

Insects have been sufficiently noticed in previous months; continue to destroy them. See article on bark-louse on page 134, and do not set out a tree that is infested with this sealy pest on any account.

Fruit Garden.

If constant pleading would effect it, every farm would have a fruit garden, and every farmer's table would have an abundance of fruit. A few neglected currant bushes and a run-out strawberry patch too often supply all the summer fruits. We mean a fruit garden which shall be planted and cared for as furnishing necessary food rather than a luxury. Have strawberries, raspberries, blackberries, etc., not by the stunted tea saucer full, but a big spudish, heaped at that, at every meal. There is health, comfort, and economy, in a fruit garden. So have one. Half an acre or an acre to a good-sized family is not too much, and let the children do all but the heavy work. If limited in means, begin with strawberries and currants. Choose a good soil near the house, manure and plow it thoroughly, and plant these, at least, and as many more as can be had.

Strawberries.—Eighteen inches apart in rows two feet apart is a good distance. Set as early as possible. If any blossom buds appear this year pick them off. Keep the ground clear of weeds by use of the hoe, and cut the runners off. The plants will form large stools and next year give a good crop of fruit. As to varieties, the Wilson is the most gen-

erally successful, but not the best. Juncunda is fine in heavy soils, and the Agriulturist in light ones. Each locality has some favorite sort. Near Boston, nothing does as well as Hovey's Seedling, which being pistillate needs the Boston Pine or some other with perfect flowers to be planted near it. Beds that were covered last fall should have the straw or other mulch removed from over the crowns.

Currants are easily raised from cuttings, and rooted plants may be had at moderate prices. Cuttings should have been made earlier, but in many places will do well if put in now. See page 88 last month. Versailles and White Grape are the best, but have some at any rate. Old and neglected bushes may be made to produce better fruit and more of it by cutting out a good part of the old and stunted wood, and leaving an open, well-balanced bush. Spade in good manure around them.

Blackberries and Raspberries. See last month's notes.

Gooseberries are propagated the same as currants. It is useless to try any but American varieties.

Grape Vines that have been covered should be placed upon the trellis. Plant vines of some kind. If there is room for anything, plant a grape vine of some kind. See page 144 for treatment of young vines.

Figs may be tried by those who have sheltered places in a mild climate; cover them in winter.

Kitchen Garden.

No matter how rich the garden may be thought to be, most things will be benefited by more manure. Regular market gardeners use from 50 to 100 tons of stable manure, or its equivalent, to the acre. See last and previous months for hints on preparation of the soil, hot-beds, cold frames, etc.

Plant in rows, as far as possible, as this is much more convenient in working than the old-fashioned way of dividing up the garden into small beds.

A marker will be found very convenient in laying off the rows. It is made like a heavy wooden rake, with teeth 12 inches apart on one side and 9 inches apart on the other. By dragging this along the prepared ground, lines for planting are marked.

Seed-beds will be needed by those who do not use glass for starting their plants, and for plants for later crops. The soil should be rich and light, of a nature that will not become compacted or caked. Many failures with seeds are due to the inability of the delicate plant to force its way through the heavy, baked soil. Sow here all plants that are to be transplanted, such as cabbages, celery, sweet herbs, etc.

Varieties.—It is of great importance to have good seeds of good kinds. Do not delay getting at once all that may be needed. See last month, pp. 90 and 102.

Asparagus and Rhubarb.—Remove the litter, and fork in a good dressing of manure. In places far from the sea a liberal salting is beneficial to asparagus. Make new beds as previously directed.

Beans.—Plant bush sorts as soon as danger of frost is past. Limas should be left until the ground is warm.

Beets and Carrots.—Sow early sorts in drills a foot apart, or in two-foot drills with radishes between.

Cabbages and Cauliflowers.—Transplant from cold frames and from hot-beds; in the latter case the plants must be properly hardened by exposure. Sow seeds in the open ground in well-prepared beds.

Celery.—Sow in seed-bed in rows 8 inches apart.

Chives.—Divide clumps and number new plantings, putting the small bulbs 6 inches apart.

Cress or Pepperygrass.—Sow a small quantity every ten days to keep up a supply. Dust the young plants with air-slaked lime, if insects trouble them.

Cucumbers may be had quite early by planting seed in frames from which other plants have been removed, giving, of course, plenty of manure.

Eng Plant.—Sow seeds in hot-bed, which should have a covering of mats on cold nights.

Garlic.—Sets obtained by breaking up the bulbs are planted 6 inches apart in foot rows.

Horseradish.—Plant as directed on page 23, (Jan.) or between the other cabbages, to occupy the ground after that crop comes off. Drop straight pieces

of roots in holes made between the cuttings and at the same distance that they are apart. Let the top of the set be at least 3 inches below the surface. Never plant crowns if pieces of root can be had.

Herbs.—Sow in seed-bed where the ground is dry and warm, Sage, Thyme, Sweet Marjoram, etc.

Lettses need a fine rich soil. Sow in foot rows.

Lettses should be kept in constant succession. If plants have been wintered in cold frames set them out a foot apart each way. Sow seeds in seed-bed.

Mustard.—Sow for salad or greens in foot rows.

Onions.—Put out sets, etc., as directed last month. Seeds are to be sown as soon as the soil is ready. Plenty of good manure is required, and it is best to make the bed each year in the same place. Sow fresh seed in foot or 15-inch drills.

Parsley.—Sow in open ground or in cold frames.

Parsnips.—Use last year's seed only; sow only in rich, deep soil, in drills 15 to 18 inches apart.

Peas.—The distance will depend upon the height the variety grows. Dwarfs will do a foot or 18 inches apart, while those requiring brush will need to be 3 or 4 feet or more distant.

Peppers.—Sow in hot-bed and treat like Egg Plant.

Potatoes.—Plant only the early sorts in the garden. Use good-sized seed, and drop a foot apart in manured drills that are a foot apart.

Radishes.—Light, warm, and rich soil is necessary. They may be sown between rows of slower crops or by themselves. Sow a portion every ten days.

Salsify or Oyster Plant.—Treat the same as carrots.

Spinach.—Cut that which has been wintered for use and sow for a fresh supply in 18-inch drills.

Swiss Chard.—A beet, the leaves of which make excellent summer greens. Cultivate like beets.

Sweet Potatoes.—Better buy plants, if but few are wanted. They are started by putting the potatoes in a hot-bed and covering with about 2 inches of rich compost. Give water and air as needed.

Tomato plants in hot-beds when large enough to handle may be potted and placed under glass or pricked out into another hot-bed. Seed may still be sown under glass, or for late crops in open ground.

Turnips.—Sow early sorts as soon as possible.

Hot-beds will need special attention to keep the plants from hurrying. Water, if needed.

Flower Garden and Lawn.

Much of the work indicated in previous months is still to be done. Get all rough work out of the way as soon as possible, and have all transplanting of ornamental trees and shrubs, excepting evergreens, done as soon as may be. The making of lawns are sufficiently treated of on page 144.

Boilers need to be carefully forked over, first giving a coat of well-decomposed manure, and

Edgings made. Box may be re-set and grass edgings laid. We wish some one would make a nice tile edging. Bricks set diagonally may be used as a substitute along paths where there is much travel.

Barbaceous Plants, where they have stood two or three years, will often need dividing; do this early. We gave a description of some good varieties in March last. Seeds of perennials may be sown.

Hardy Annuals may be sown when the ground is dry, but tender ones are best left until May, unless they can be started under glass. Seedsmen's catalogues designate whether the plants are hardy or tender.

Bedding Plants should not be put out too early. They are generally sub-tropical things, and a cold spell gives them a check, if it does not kill them.

Forced Plants.—In cities and towns plants that have been forced are often offered for sale. As a general thing they are worthless for future use, although for present gratification they are often worth the price asked.

Climbers.—The hardy climbers are great favorites with us, and we would introduce them wherever it is possible—on verandas, fences, and to cover unsightly objects. Our woods supply the Virginia Creeper, Moon-seed, Wax-work and others, and

the nurseries have a long list of the exotic ones.

Roses.—Where there is room, have a plenty of June roses, but in restricted gardens the China varieties will give the most satisfaction, as they bloom all the time. The varieties are so numerous that we must refer to the catalogues for a list.

Green and Hot-Houses.

These "hunts" are of course intended only for amateurs who manage a small house themselves, and not for the regular gardener. Give air on mild days, guarding against sudden changes, and be prepared to warm up during a cold, damp spell.

Propagating for out-of-door planting should be going on, to supply the demand for bedding stuff. As soon as the plants have rooted in the sand of cutting bench, transfer to small pots of good soil.

Seeds of tender annuals may be sown for plants to use out of doors. Cover small seeds lightly. Start

Dahlias by placing their roots in a warm place, or if they have already started out off the sprouts with a portion of the root, and put them.

"Foliage Plants," (as the garden term goes), such as Canus, Coloensis, etc., may be potted, as may

Tuberose; indeed the only way to get a satisfactory result from tuberose at the North is get them well started before they are put out.

Shrubs making their growth will need more water.

Insects will start into new vigor with the warm days of spring; apply smoke and other remedies.

Totted Plants.—It takes an amateur a long time to acquire courage to use the knife. It is often the case that plants go from year to year without being cut, and get more "lanky" and miserable each year. Cut back any plant that is in bad shape or shows a weakly growth, and report in fresh soil if needed.

Cold Grapery.

Here the heat of the house depends upon the sun, and its proper temperature is governed by the management of the ventilators. An artificial summer is to be created, the heat and moisture of which are to be kept suited to the vines by the care of the ventilator. The first thing to be done is to secure a uniform starting of the buds on the vine. If the vine were put up in its place at once the upper buds would get the advantage of lower ones and the growth would be unevenly distributed. To counteract this, the vine is so suspended that it will form a curve, with the upper end of it hanging down. By varying the point of suspension and the curvature of the vine, a uniform start can be secured, and when the shoots have made a growth of two or three inches, the vine is to be tied in place. If the upper buds fail to start, or if the vine shows cracks and bleeding, some injury has happened to it during the winter, and it must be cut back to a good bud which will furnish a cane to take the place of the old one. The temperature of the house in the early part of the month should be about 65°, which towards the end of the month may be increased to 70° or 80°. Sudden changes of temperature must be avoided, and a favorable moisture be maintained by a free use of the syringe morning and evening.

Commercial Markets—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, show at a glance the transactions for the month ending Mar. 14, 1883, and for the corresponding month last year:

TRANSACTIONS AT THE NEW-YORK MARKETS.									
RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.	Butter.	Eggs.	Cheese.

1882	1,175,132	1,719,212	43,442	46,614	1,724,212
1881	1,175,132	1,719,212	43,442	46,614	1,724,212
1880	1,175,132	1,719,212	43,442	46,614	1,724,212

Gold has been depressed in price, since our last closing at 139½. Breadstuffs have been moderately active since our last, but quite variable in prices. The offerings of flour and wheat have been comparatively limited, but toward the close, have run ahead of the wants of buyers, to the injury of prices, which close with a downward tendency. Corn has fluctuated materially through the month, but closes briskly and buoyantly, on an active home and export demand. Rye and Barley advanced in price, on light receipts, and a fair inquiry—the former closing heavily, and the latter very firmly. Oats have been less sought after, and have been lower and irregular. Provisions have been in good request, but hog products have been unsettled in price, closing in favor of purchasers. Beef, Butter, and Cheese, close with an upward tendency. Cotton has advanced materially, on an unusually active movement, chiefly speculative; but it closes less firmly. Wool was in very brisk demand for a week or two, and quoted a shade higher; but the later dealings have been less extensive, the market closing about steady. Hay has been salable at full prices. Hops and Tobacco have been quiet. Seeds have attracted more attention, closing more firmly.

The above table gives the weekly receipts for the four weeks ending March 9, the total number of all kinds for each week, also the number of each kind for the four weeks, as well as the number of all kinds for the month.

The season of Lent always has its effect on the cattle market. Live animals of all kinds have been fewer in number than for the same period last month. There have been more sellers, and consequently smaller droves were offered. Buyers for large lots were few, and "peddling" always makes a slow market. The storms interfered with the prompt arrival of stock, and many buyers would wait until afternoon, hoping new arrivals would give them a better selection. While the market last month was brisk, this month finds it very slow—many of the best sales being made late in the afternoon. The supply has been quite even, and equal to the demand, but not at any time exceeding it. Some days sellers thought an extra 100 head would turn the chances against them, and they would have to sell at a sacrifice. Sometimes 50c. a head on cattle would lose them a buyer, so close were the bargains made. **Beef.**—For good, sleek steers, prices kept rather even during the month, with a slight downward tendency; at the close, few sales were made at the highest figure quoted in the following list, which gives the range of prices, average price, and the figures at which the largest lots were sold:

Feb. 17th ranged 12@20c. Av. 15½c. Largest sales 15½@17½c. do 21st do 11@18c. do 17½c. do 15 16½c. do 21st do 10@16c. do 17½c. do 15 16½c. do 21st do 10@16c. do 17½c. do 15 16½c.

The week ending Feb. 22d, Washington's birthday, gave us some fine, premium cattle; one pair of 6 yr. old steers, we think not excelled by anything that has been in the market for months. They were grade Shortorns, fed for 2 years by Geo. Preston; weighed 8050 lbs., and were sold to one of our fancy butchers for 20c. per lb., or \$660, as they netted 3300 lbs. These steers did not have special care, beyond that given to the remainder of the drive, and is a good instance of the readiness with which Shortorns and their grades lay on fat; the rest of this drove brought 10@19½c. Another lot of 21 head from Dutchess Co., weighing 9½ cwt. dressed, were very pretty steers, sold quickly at 18@19c., and were cheap. In a very fat lot of 10 head from Ohio, one large pair brought \$675, or about 19½c. per lb. net. The week ending March 2d presented many fine cattle; one carload from Genesee Co., very extra, but not large, steers sold for 20@21c. per lb. With these exceptions the market kept pretty even as to quality; the supply of oxen and dry cows was very much smaller than last month. The few best of this drove would sell readily, and the rest slowly in lots of from 1 to 10 head, at 1½ to 1½c. less than the "tops." Some lots were so even that a choice seemed hardly necessary, the animals each weighing about 1300 lbs. live weight. Such cattle are rather young for our butchers, the preference being for older and heavier cattle. To sum up: our market for a month has been very steady, both in quality and price; while some few animals have brought a high price, above even Christmas prices, the average has been higher also. This is accounted for by the fact that they sold in smaller lots to be immediately killed and retailed, and smaller profits were looked for. Dealers look for a decline when western transportation gets settled. **Milk Cows.**—Good cows have been a little more plenty this month, with about the same number of head in market. A good cow seldom brings more than \$100, though a few extras with their calves, sold for \$110@115. The general price for a fair cow is \$80@85; while poor milkers, and thin, old cows, sell slow at \$10@50. Sales have been slow, mostly to city milkmen, 2 and 3 at a time, at \$65@75 a head. **Veal Calves.**—Veals have been scarce, and sell quickly at 10@14c. per lb. live weight. Fewer "Hog-dressed" calves have come in, and everything, alive or dead, has been sold quickly. Dressed calves have sold at 5½c. and 11½@13c. is considered a good price for ordinary live calves. A calf which came in with a lot of cattle from Dutchess Co., sold for \$35; he was 6 months old and very fat. **Sheep.**—There is quite an increase in numbers over those of last month, and prices remain about the same; good lots bring 7@9½c. @8c. per lb. A lot of 30 South-downs, extra fat, and averaging 137½ lbs., brought 9c. Some light lots from Ohio sold as low as 5½c. For the week ending March 2d, we had reached as high as 9½c. for extra lots, whole car loads selling readily at 8½c. At present writing some sales have been made as high as 10c. a lb.; these were large Canada sheep, five of which brought \$3 each, and four \$12.50 each. These are high prices. **Swine.**—Receipts are small for this season, and prices keep high. Sales are made quickly at 9@9½c., live weight; if very fat, 10c. may be had. Western dressed hogs sell readily for 10½@11½c.; these come in slowly and find a ready market. These packers who looked for lower prices have been disappointed, and are obliged to take Western dressed, quite too small for their purpose, or do without. This soon exhausted the supply, and for the week ending March 9th, there were only 727 in market, selling at 12½@12½c. Packers still believe in a downward tendency, and steadily refuse to give over 9@9½c., live weight. As we close our report, prices are working downward and sales slow, with 19 car loads in market unsold.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.20 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

A SECRET

"That Troubles a Good Many People."

A reader of the *Agriculturist* writes: "...There is some secret about your business operations that troubles a good many people—especially such of us as have long since learned to believe what you write. You offer large premiums for subscribers, but how you can afford to pay them is what troubles us. We can see that you give in the paper a great number of beautiful engravings, that, from the fine cutting and printing, must cost a great deal of money—more than \$10,000 a year, it is said. Then the editing, etc., must be very costly; and then we also the current high prices for everything, we don't see how, for the small subscription money, you even can buy the 450 pages of excellent white paper you send every subscriber during a year. Now, how can you, on top of all these expenses, give those great premiums, if they are genuine articles, of the value represented? It is the doubt on this subject that makes many of us hesitate about trying to get up premium clubs—lest there may be some catch in it. We could get them, and would be glad to do so; but if there is no 'kink' about it, how can you pay them, unless you have a mint of money inherited, or made some other way, to give away just for the fun of it?..."

EXPLANATION.

The explanation is easy. Some single engravings cost \$150 and more, but that is only one-tenth of a cent for each of 150,000 subscribers. The \$10,000 a year for engravings amount to only about 6 cents for each subscriber. And so it is of other large expenses. Thirty thousand dollars expended in procuring and preparing information, engravings, etc., is only 20 cents for each of 150,000 readers. That's one part of the secret, and it shows why a paper enjoying so large a circulation can afford to give so much more for so little subscription money.... The mailing expenses are heavy, but it costs little more to mail to a club of 20 subscribers at one post-office than it does to mail one paper to a single subscriber. So clubs get the paper much cheaper.... Again, advertisers can far better afford to pay \$1.50 or even \$2.50 a line to reach 150,000 people, than they can to pay 10 cents a line to reach only 5,000. And our careful rules which shut out bad advertisements, make our business columns worth much more to the good advertisers who are admitted. So we have plenty of profitable advertising. From this source we get enough profits to pay all the loss on subscription, (for the paper is furnished to subscribers at a great deal less than it costs to make it,) and then we have enough left to pay all the premiums in good articles, and enough more to satisfy us for our own trouble and risk as publishers. The premiums pay people for largely increasing our subscription list; the larger subscription lists make our advertising more profitable, and thus supply more money for more premiums. The people who are persuaded to take and read the paper by our premium canvassers, are benefitted, and so it is a good thing all round.... We shall continue the premiums for two months yet, and give the first-rate useful articles named in the table below to all who send the number of subscribers required. Nothing would please us more than to send out several thousand of them in April and May. Our advertising is large and we can afford it. Send along the names. A few hours spent in canvassing will fill up a club already started, or make up a new one. People are now more easily persuaded to subscribe than in winter, for they are now beginning Spring

Work, and more feel the need of the hints and suggestions they get in these well-filled pages. You, Reader, can get one of the good premium articles, just what you desire, by a little effort. Try it. If you have not time to get up a large club of names, try a small one for this spring, just to get in the way of it, and then next year strike early for a larger one.... Here is a list of the premiums, and the number of subscribers required to get each article:

Table of Premiums and Terms, For Volume 27—(1868).		Number of Sub- scribers required
Open to all—No Competition.		
No.	Names of Premium Articles.	Price of Premiums, at \$1.50 at \$1.

ers. . . Remit in drafts or checks on New-York City banks, payable to the order of the Publishers; or in P. O. money orders; or in registered letters, if money must be sent.

Full Descriptions of the Premiums, on a separate sheet, will be sent free to any one desiring it.

Nos. 50 to 60—Volumes of the American Agriculturist (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. We have stereotype plates from the Sixteenth to the Twenty-sixth Volume complete, from which print numbers as needed. The price of the volumes is \$1.50 each, at the Office, or \$1.75 sent by mail, as they must be post-paid. They are put up in clean numbers, with the Index to each volume. —They are profusely illustrated, the Engravings used in them having alone cost above Twenty Thousand dollars! Those obtaining premiums for less than eleven volumes, or for less than the volumes desired, from XVI to XXVI, inclusive. For ordinary use, the sets of numbers unbound will answer quite well.—Many hundreds of these volumes are taken every year as premiums. **37** In Nos. 61 to 71 we offer the bound volumes also.

Nos. 74 to 85—GOOD LIBRARIES.

—In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any one of the premiums 71 to 85, may select any books desired from the list below, to the amount of the premiums, and the books will be forwarded, *paid through* to the nearest Post-Office, or Express office, as we may find it most convenient to send them.

No. 86—General Book Premium.

—Any one not desiring the specific Book premiums, 74 to 85, on sending any number of names above 25, may select Books from the list below, to the amount of 10 cents for each subscriber sent at \$1; or to the amount of 50 cents for each name sent at the (ten) club price of \$1.50 each; or to the amount of 60 cents for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through us.

BOOKS FOR FARMERS AND OTHERS.

(For sale at the office of the *Agriculturist*, or they will be forwarded by mail, *paid through* to the nearest Post-Office, or Express office, as we may find it most convenient to send them.)

containing a great variety of items, including many good Hints and Suggestions, which we throw into smaller type and condensed form, for want of space elsewhere.

How to Remit—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of **Orange Judd & Co.**

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the *Registry fee*, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and send the letter in the presence of the postmaster, and take his receipt for it. Letters sent in this way to us are at our risk.

Postage.—To our published terms for the *American Agriculturist*, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. Everywhere in the United States, three cents, each quarter, or twelve cents, yearly, must be pre-paid at the Post-office where the paper is received.

Read the Excellent Business Notices

which crowd our advertising pages. The publishers have been compelled to add four extra pages, (H in all) in order to get in their own book notes, that were shovelled out from previous numbers. Our readers derive a double advantage; first, in the corresponding increase of reading matter, (we always add a page of reading matter for every additional page of advertisements, beyond eight) and, second, every column of advertisements is a highly useful source of information. These pages are well worth a careful and thorough perusal; they present an epitome of what is doing in the business departments of Agriculture, Horticulture, etc.—what is for sale, where, by whom, and at what prices. A wide field is thus given for making selections, procuring needed supplies of plants, seeds, implements, etc., etc. We aim to add nothing but responsible, reliable advertisers, with whom our readers may rest in confidence. To gratify the advertisers, and to make them feel their responsibility, we ask all our readers when sending orders, or soliciting circulars, catalogues, etc., to state where the advertisements were seen.

Walks and Talks on the Farm.

These of our readers—which we presume to be the majority—who admire the fresh, practical, and instructive "Walks and Talks" will be glad to learn that we have made an arrangement with the writer which will insure these pleasant papers for a number of years, as well as the excellent aid of Mr. Harris in other departments of the paper. The publishers intend to spare no expense in keeping the *Agriculturist* up to its present standard, or in taking a step beyond, whenever they can see the way.

Darwin's New Work.—The Variation of Animals and Plants under Domestication.

—Mr. Darwin is widely known for his work on the Origin of Species, in which he advances some views that have been the source of much discussion in the scientific world. The present work treats of the variations in our domestic animals and cultivated plants, discussing the circumstances that influence these variations, inheritance of peculiarities, the results of in-breeding, crossing, etc. It is one of the most remarkable books of the present day, presenting an array of facts that show the most extraordinary amount of observation and research. All the domestic animals, from horses and cattle to canary-birds and honey-bees, are discussed, as well as our leading culinary and other plants, making it a work of the greatest interest, not only to the breeder, the intelligent farmer, and the man of science, but to the general reader. Feeling that a work of such importance, and one that will be so frequently discussed and referred to as authority, should be acceptable to the American reader, the Publishers of the *Agriculturist* have in press a reprint, from advance sheets furnished by the author, through Professor Asa Gray of Cambridge, who will furnish a preface to this edition. The work will be published in two neat volumes of over 400 pages each. A noticeable feature of the work is the exact reference

for "chapter and verse" of every statement made, and another in the very copious index, so that it forms a cyclopedia to the subjects upon which it treats. Ready early in April, 2 vols., illustrated, \$6.00.

Allen's Catalogue.—This is more than a mere business catalogue; it is more like a cyclopedia of farm implements, and record of the inventions that have been produced to facilitate agricultural and horticultural operations. Messrs. R. H. Allen & Co., No. 120 and 191 Water-st., N. Y., are not only among the largest dealers, but are manufacturers on an extensive scale.

Prof. John Gamgee in this Country.

—We had the pleasure of greeting this distinguished Veterinarian in the office of the *Agriculturist* a few weeks since, and of welcoming him cordially to America. Prof. Gamgee is known to many of our readers through his works, and through the articles of his which were published far and wide in this country at the time the Kindest was raging in Great Britain. Years before this pest broke out in England, he had predicted its coming and indicated the course which should be taken, and it was not until his advice was followed that the plague was stayed in England and Scotland. Professor G. was the original mover in the gathering and organization of the first Veterinary Congress, which resulted in the formation of an association that convenes annually, and has already done great good. He may be appropriately styled the father of the modern school of Veterinary Medicine—that school which regards prevention as more important than cure, and studies diseases not so much in the poor stricken beasts, as in the localities which breed the pestilence, where contagious have their origin, and may be most successfully combated. Professor Gamgee is at present at the head of the Albert Veterinary College, London, and visits this country with a view to introduce a method of preserving meat quite fresh and sweet for several months, at ordinary temperatures. He will travel extensively over the United States, and we bespeak for him a hearty welcome from agriculturists and others.

Life Insurance.—The subject of Life Insurance has already been presented in these columns, and its propriety and value as an investment are generally accepted. The N. Y. Mutual Life Insurance Co., which we believe, is the largest in the world, publishes its annual statement without comment, as the best way of presenting its claims to the confidence of the public.

Sundry Humbugs.

—The spring campaign has fairly opened. We have the highly-colored and tempting programmes of fifteen separate and distinct "honorific" associations. Only a few of them appear to be worthy of special notice. It is not necessary for us to go over the ground again, and describe how these people operate. In a great variety of forms, they persuade the unwary to invest one dollar in the hope of receiving a hundred dollars. The bait is varied, but it covers the same old hook. At present, some of the most "promising" humbugs are in the book and paper line. The Broadway Publishing Co., 539 Broadway, is just now believed to be in a transition state, and soon to appear as A. D. Bowman, 43 Broad-st. They offer a book, and a prize of not less value than \$3.00, with a good chance of getting \$1,000, all for \$1.00. They can only be found by letter.—The Washington Library Co., Philadelphia, come the Soldier Orphan dodge, so common nowadays, and offer pictures, books, etc., with large prizes in money, (greenbacks)... S. D. Sime, Cincinnati, proposes to give Pianos, Melodeons, Sewing Machines, Horses and Carriages, Jewelry, Silver Plate, etc., and Money, and all he asks in return is \$2.00. Van Allen and his Enrecks Oil are still in the market. We can only say, don't trust this oil, but buy better. —M. We-thee, an old hand, is not to be found at the numbers advertised. —W. I. Wheeler & Co. propose to sell \$125 Watches for \$1.00, and to give agents for the trouble of selling tickets and sending in names, Diamond Jewelry by the hat full. —Wilcox & Corning are not to be found at 163 Broadway, and we can not see the Sewing Machine they offer for \$1.00. Our advice is to avoid all cheap sewing machines. —We have a pound more or less, of circulars and tickets of Arrandale & Co., 163 Broadway, and judging by what they offer, we should think nothing less than a building one hundred feet square and five stories high, would hold all they offer to the public. We find in reality that a fourth-story back room, small, and dim, seems to contain their Silver ware, Jewelry, Fancy Goods, Dry Goods, Clothing, etc., the choice of which is offered for \$1.00, and we should think the goods were about worth it. For \$10.00 you can get any kind of a watch! The novelties of the season are Wickes & Taylor, counsellors at law. These fellows make very smooth promises, and are apt to mislead the unwary. We are glad to notice some help coming from Pennsylvania. The legislature, by the repeal of the Gettysburg Asylum Charter, seem to have roused the press of that State

to a sense of their duty. We quote from the Franklin Repository, Chambersburg, Pa.: "No You Don't."—A brace of cunning fellows in New York, representing themselves to be 'Attorneys and Counsellors,' profess the desire to forward 'the ends of justice,' by collecting from the proprietors of Gift Enterprises the prizes justly due to the ticket holder. A remittance \$2.00 is the preliminary step in the proceeding. These artful dodgers ask us to spread their advertisement before our readers, 'at the same time adding any local ideas of your own.' The idea strongly localized in our head is that these fellows are as arant rogues as those they pretend to watch, and we caution our readers against being caught by their transparent swindle." We have visited their office, and, of course, could only find the clerk!!.. We warn all against Rev. Edward A. Wilson, Williamsburgh, N.Y., and his prescription for consumption, free of charge. No such man is known at the number given. We pronounce him an unmitigated scoundrel—second only to Dr. Fancher, 88 William-st., and Dr. M. L. Byrn, Box 4698, New York Post-Office. For these three men we can hardly find words strong enough to do justice to the subject. One of these chaps professes to issue a monthly paper to disseminate universal intelligence. We have one of these precious sheets, and find it to be of the infant murder and licentious order. Dr. Byrn makes a very bad book, and vends medicines to match, and is another nuisance.... Among the papers asking for exchange is one purporting to be devoted to Agriculture, Literature, Poetry, etc., etc. It goes by an attractive name. Its contents are the poorest trash imaginable—love, vengeance and thunder, and the like. But the trouble does not lie in its worthlessness. By turning to the last few pages, we see wonderful inducements offered to agents for spreading its circulation, in the way of Jewelry, Books with high-sounding names, Pianos, Organs, Mooney, (Greenbacks,) etc., etc. Then follows a long list of books to be sold at greatly reduced prices, each book to be accompanied with a prize or "gift" valued from \$1.00 to \$100.00. We pronounce this a humbug of the worst sort, the paper itself being only a blank. We again warn all persons against investing money in any gift publishing establishment of this sort.

The Book of Evergreens.—By Josiah Hoopes. This is a long needed work, as it posts up the present state of our knowledge upon the cone-bearing plants, or Coniferae, of the botanist. Mr. Hoopes is one of those persons rarely met with—a practical cultivator, and a man of science at the same time. While his work gives us all the Coniferae arranged in the classification of the botanist, it at the same time treats of the experience, not only of the author, but of American cultivators generally, with this large and important family of plants! Evergreens play so interesting a part, not only in ornamental planting, but in what may be called economical planting, (i. e. hedges, screens, wind-breaks, etc.), that we are sure a work which treats of their propagation and culture, describes in both popular and scientific language the many species, and, what is of not the least importance, gives a list of the tender and unreliable ones, will be warmly welcomed by every lover of these beautiful trees. Mr. Hoopes brings to his work a perfect enthusiasm for his subject, and is as free to condemn a plant as if he were not a nurseryman. All the latest novelties from Japan, the North-west, etc., are noticed, and their success or failure, both in this country and in England, is recorded. The work is abundantly illustrated with engravings, so carefully executed that the publishers feel it due to that department of their establishment to call especial attention to them. We must commend the conscientious care the author has shown in striving to arrive at the correct names. As a general thing, the nursery catalogues are at fault in this respect; they often contain the same thing under different names, or trees with names that have long ago been shown to be incorrect. We cannot much blame the nurserymen, as the standard works on evergreens have heretofore been foreign and expensive. We hope, now that we have an available work which may be considered as a standard, nurserymen will do better. Not the least interesting portion of the book is an account of the principal collections of evergreens in the country. The work is now ready. One large 12mo vol., on heavy tinted paper, in bevelled boards, Price, \$3. By mail at same price.

Cheap Lands at the East.—"G. C." Ct. There is no need of going very far west to find low-priced lands. It is true that farms in a high state of improvement, with good buildings, cannot be bought for much less than fifty dollars an acre, and in many places near large towns, they are often worth four to ten times that sum. But it is still possible to buy farms with many improvements on them, and good facilities for making more, for thirty dollars an acre. In the last monthly report of the Agricultural Department, at Washington, there is an estimate given of the value of unimproved lands, in several of the older States. In New York, the average value of these lands is put at \$32 an acre. In the north

part of Oneida County, there is a tract of spruce land, worth but \$5 an acre. In the Catskills, woodland can be bought for the same price. In Herkimer County, there are a hundred thousand acres for sale, from 50 cents to \$5 per acre. In Suffolk County, a large tract of pine woods, at \$8 an acre. In Washington County, land can be had for \$3 an acre. In Worcester County, Mass., there are unimproved lands, at \$6; in Barnstable County, at \$5; in Hampden County, rocky and swampy lands, at \$5. Salt marshes, easily reclaimed, lie all along the coast, from Chesapeake Bay northward, at low prices. These lands are all near good markets. Some of them can be made available for tillage, and most can be pastured or kept profitably in forest. They all want capital to improve them. However, all low-priced things are not necessarily cheap.

The Bluffton (Mo.) Wine Company.

The annual report of this enterprise shows a prosperous condition of its affairs. The company, of which George Husmann is President, includes some of the most substantial men in Missouri; it owns an extensive tract of land on the Missouri River which is well adapted to grape culture. The land is offered to settlers on favorable terms. Those who wish to go into grape growing at the West should send for a prospectus either to George Husmann, at Herman, Mo., or Dr. L. D. Morse at St. Louis.

Eighty, not Eight.—On page 98, March Number, a correspondent speaks of a pine tree planted in 1813, which "now has a diameter of more than three feet and a height of nearly eight feet." It will be seen that a *y* dropped out and made eight out of eighty, a *y'd* difference.

A New Paper, The Model Farmer.

Semi-monthly, edited by Thomas J. Key, and published by Key & Barr, Corinth, Miss. This neat and unpretending journal deserves a welcome, not only from the fact that it is the only agricultural paper in Mississippi, but because it is a "model" which some of its contemporaries will do well to follow. There is not a growl in it, at things that are past change, nor a fling at other parts of the country. It goes to work in earnest, and has such a cheerful, common-sense way about it that one cannot help wishing it the full measure of success that it deserves.

Whitewash.—"N. P." Good lime and water are the essentials. Some brands of lime have so many impurities that they are unfit for inside work. Slake the lime in a clean vessel with boiling water, making it so thin that a brush will lay it on smoothly. An ounce of salt to a pailful will make the wash adhere better. Some add a very little bluing, as in rinsing clothes. When the whitewash is made, keep it off your fruit trees, and on your walls and fences. A nice cream color may be made for fences by adding to a half bushel of lime three pounds of yellow ochre. Nice whitewashing depends quite as much upon a good brush and good work as upon the wash.

Beets Drying Up Milk.

"P. R." N. J. We have used both sugar beets and mangolds for several seasons, and never noticed any such tendency. The difficulty complained of is probably owing to some lack of other food, or to unfaithfulness in the milker.

Early Rose Potatoes.—On another page we notice the remarkable price at which Mr. Heffron sold his potatoes. Our advertising columns state that a portion of this lot has been sold at \$89 a bushel, and we have seen a letter to Messrs. Bliss & Son in which the writer proposes to pay \$100 for a bushel of Early Rose.

Bad for Mr. Knox.—Advertisers who come late will be left out, and we doubt not that Mr. Knox will be very much disgusted when he opens the *Agriculturist*, and finds his broadside seed advertisement omitted. Mr. K., besides his most extensive small fruit farm, has a first-class seed and implement store, under the immediate charge of his son. Especial attention is given to sowing seeds, as well as plants, by mail.

Implement Catalogue.—We have from Plant Bros., Platt & Co., of St. Louis, and Kansas City, Mo., a very full and excellent illustrated Catalogue of Farm and Garden tools, seeds, etc. It is accompanied by a calendar, a descriptive catalogue of seeds, and other valuable reading matter. Another evidence of Mo. progress.

Preservation of Meat by the Gamgee Process.—The process of preserving meat perfectly fresh and sweet for many months, without the use of salt or ice, has something about it which challenges every doubt. Seeing is said to be believing, and many persons saw hanging in the great show window of the *Agriculturist* office, on Broadway, four carcasses of English mutton preserved in this way, one, two, three, and four months old after slaughtering. One carcass had hung

for six weeks in Professor Gamgee's kitchen before it was boxed to cross the Atlantic. There was not the least taint of corruption upon any part of them. Two were slightly mouldy, owing to the manner in which they were packed, but were otherwise perfect. A select company had the pleasure of dining with Prof. Gamgee upon some of this mutton, and it was pronounced unsurpassed. The process by which this meat was cured is patented in this country, and consists of causing the animal to inhale carbonic oxide gas until it loses consciousness, when it is killed and bled. The carcass is then quickly dressed, and while still warm, exposed a short time in a chamber to an atmosphere of the same gas, mingled with a little sulphurous acid gas. These gases, especially the former, combine with all the oxygen in the system, and take away all that enters the meat through absorption of air. This very important discovery, which is the result of years of study, may be of incalculable advantage to the people of this country and of the old world. If Texas beef can be placed in our markets at 5 or even 10 cents per pound, both the raiser there and the consumer of beef here will be greatly benefited. It seems almost as if the time might soon come when beefs, and sheep, and hogs, will no longer be packed in close cars, transported for days and nights in suffocating heat, or piercing cold, driven through our crowded cities, feverish and excited, starved and famishing for drink, to be thus slaughtered; but killed within sight of their own pastures, and their flesh, preserved by this process, transported like any other merchandise, to be sold and used any time within six or eight months. Experiments will soon be made of transporting "Gamgeed" beef and mutton from some of our Western States, and from Texas, and our readers shall have reports of the success. These experiments or tests are taken in hand with great zeal by several gentlemen of large means and entire responsibility, so that we may hope for speedy and accurate results. It is but fair to add that this interesting discovery of the action of carbonic oxide on fresh meat was made in pursuing investigations having for an object the furnishing of healthy meat, at a cheap rate, to the population of Great Britain.

A "Small" Lemon.—"Citrus", of St. Augustine, Fla., writes: "Please receive herewith a small specimen of our Sicily Lemons, produced in my garden, at this place, and as only a moderate type of the excellence of many of the semi-tropical fruits of Florida, all of which are grown here of rare excellence of quality, flavor, shape, and size, as compared with the more tropical climate of the West Indies." The "small" lemon measures a foot in its smallest circumference, and attracts much attention from the passers on Broadway.

The American Naturalist.—The March number begins a new volume, and presents as not only an increased amount of reading matter, but the assurance that the magazine will be continued. Mr. George Peabody has placed in trust a fund to found the Peabody Academy of Science, and the *Naturalist* will hereafter be issued as one of the publications of the Academy, at Salem, Mass., on the same terms as heretofore—\$3 a year.

Hens Eating One Another's Feathers.—"G. S. W." Foxboro, Mass., asks what will cure hens of eating the feathers off one another's necks. This trouble usually occurs when hens are getting ready to begin laying or are laying, at a season when insect food is not to be had. We may be mistaken, but have the opinion that a block of beef scraps in the yard would be a cure. We feed our poultry all the fresh bones from the kitchen, pounded fine, and never have any trouble of this kind. Beef scraps would probably affect the flavor of the eggs a little in warm or mild weather. Most people will not notice it, and the eggs *will* just as well.

Sick Chickens.—On page 7 of the current volume, in an article entitled *Bad Luck with Poultry*, a disease was described as causing the filling up of the mouth and throat with a yellow, offensive, tough mucus. Several remedies have been suggested, and it seems that the disease is quite common and fatal. Sprinkling salt and burnt alum into the mouth after wiping it out thoroughly, is recommended. "C. I. L.", of Bethlehem, Pa., was successful in curing several cases, and in first removing all the substance thoroughly, then swabbing and rinsing out the mouth with a solution of Sulphate of Iron. An acquaintance recommends very stimulating diet of scalded meal or soaked bread with red pepper, and ale; tincture of iron in the water, and a daily washing of the mouth in vinegar and water, or vinegar, if not too strong.

Strawberries in New Jersey.

The following account of strawberries in southern New Jersey is from the Report of the West Jersey Fruit Growers' Association. It is the experience of market growers in Cinnaminson, Moorestown, and that part of Burlington County where the soil is generally very light:

"Our general system of cultivation is in beds from 4 to 5 feet wide, made from single plants set in rows about 2 feet apart, generally in the spring. Yet some very good results have been obtained when the row system of cultivation has been adopted, mostly with Wilson's Albany, which seems to be gaining confidence in the other townships besides Burlington and Beverly, where it has been more generally cultivated for years. In addition to the Wilson's Albany Seedling, Downer's Prolific, French's Seedling, Cutter's Seedling, and Ida, are the general favorites for cultivating for market purposes. The latter variety, though introduced recently, has been largely planted of, and as far as vigor, healthfulness, and productiveness is concerned, it seems to meet the wishes of the people; yet the size being from medium to small, will, we fear, prove a drawback. The Juniata, after another year's trial, corroborates what was said one year ago, that it 'is a poor grower on any but very strong soils.' The foliage burns badly in the summer, and as far as has been tested in this vicinity is not worthy of cultivation. Metcalf's Early, introduced from Niles, Michigan, represented to be several days earlier than the Wilson, producing a large crop in a very short time, has upon trial proven no earlier, and the berries are so soft as to render them unsalable in the market; hence we would deem it unfit for general cultivation. Among the new varieties on trial, are the 'Singer,' a very vigorous grower, handy, berries said to be large, bright colored, and firm, introduced by Charles Harmer, of Philadelphia. The 'Durand Seedling,' introduced by F. Brill, of Newark, N. J., is a vigorous grower, of good flavor, promises to be a valuable variety for market. Barnes' Mammoth, strong grower, berries large and handsome. One plant was on exhibition at the Strawberry Show, at Moorestown, the past season, which was of monstrous size, and full of fruit. The Philadelphia, which fruited in this vicinity last season, was several days earlier than any other variety, good flavored, vigorous grower, good size and color."

The Ives Grape.—"Worthington," of Ohio, thinks that we praise the Ives too little and the Iowa too highly. We never expect to suit all the grape growers. When we discuss quality we must put the Ives very low. If it is a question of adaptability to, and profit in, particular localities, then it takes a high rank. We say, grow the best grapes that a locality will produce, and if the Ives is the best, as it seems to be in certain parts of Ohio, grow that. The Ives does finely with Mr. Knox, but is inferior with Mr. Hunsman. In the present state of grape culture we are obliged to be cautious how we recommend any variety as the grape for every locality.

Turkey Rhubarb.—"J. O. D." No seed to be had, and it would probably be very inferior in quality even if the experiment could be made here.

Seeding Down in the Spring on Oat Strubble.—"Inquirer," of Canada. Rather than sow grass seed, as you propose, on the strubble, we think it better to wait and give the piece a very thorough harrowing, going over the ground until it is as mellow as a garden; then sow the seed and hush it in. The grass will do better than if sown with any spring grain.

Potato Diggers.—We most respectfully decline to take the responsibility of advising in regard to potato diggers—such to buy. There are serious, we may almost say radical, objections to all we have ever seen in the field. There are some, however, which, as the pomologists say, "promise well." When we are assured of the success of any by personal inspection of its operation, and know that there is a prospect of the market being supplied, our readers may expect us to speak out.

Catalogues Acknowledged.—"Seak."—Robert Baist, Jr., Philadelphia; John Vanderbilt & Brothers, New York; J. M. Thorburn & Co., New York; Jas. Vick, Illustrated Catalogue and Floral Guide, Rochester, N. Y.; Henderson & Fleming, Illustrated, New York; Jas. J. H. Gregory, Marbled, Book; Alfred Bridge-man, New York; E. Newbury, Brooklyn, Conn.; M. O'Keefe, Son & Co., Rochester, N. Y.; Hazen & Schmidt, Erfurt, Prussia; F. A. Haaga, Jr., Erfurt, Prussia; John Stewart & Sons, Dundee, Scotland; Henry A. Dezer, Illustrated, Philadelphia; B. K. Bliss & Son, Illustrated, New York; Theodore Ch. Wendel, (Tree Seeds), Boston. Hovey & Co., Boston, Illustrated; J. R. Deane, N. Y.; J. W. Elliott & Sons, Philadelphia; L. D. Scott & Co., Huron, Ohio; Vilmoren & Co., Paris, France. Small Plants and Vines.—S. D. Reimann, Newfane, N. Y.; H. B. Linn, Sandusky, Ohio; D. J. B. Haines, Gaines, N. Y.; Myron De Wolf, Delaware, Wis.; J. Knox, Pittsburg, Pa.; D. H. Brown, New Brunswick, N. J.; Ferris & Caywood, Poughkeepsie, N. Y.; Parly & Hance, South Bend, Ind.; Thos. C. Andrew, Moonstown, N. J.; Francis Bell, Newark, N. J.; C. W. Grant, Iowa, near Pockhick, N. Y.; R. W. Holton, Haverstraw, N. Y.; John W. Bailey

& Co., Plattsburgh, N. Y.; David Long & Son, Williamsville, N. Y.; Elijah Myrick, Croton Junction, Mass.; Xyriscoke—Joseph Cochran, Havana, Ill.; B. M. Watson, Plymouth, Mass.; Ellwanger & Barry, Rochester, N. Y.; Hoopes, Bro. & Thomas, Westchester, Pa.; Wm. S. Little, Rochester, N. Y.; C. Raoux, N. Y. Importer; J. W. Manning, Reading, Mass.; John W. Adams, Springfield, Mass.; Mahlon Moon, Morrisville, Pa.; Potatoes.—Reisig & Hexamer, Newcastle, Westchester Co., N. Y. Green-House and Florists.—George Such, South Amboy, N. J.; Peter Henderson, South Bergen, N. J.; John Saul, Washington, D. C.; Bennett & Davidson, Flatbush, N. Y.

Sell-milking Cows.—Several Inquirers. —Sitting the tongue for an inch or two, even cutting a slender Y-piece out, may do sometimes; it will not work in all cases. Muzzles set with nails often fail, though we think they ought not to, if the nails are made sharp enough and the muzzle is attached by three or four straps to the halter, so that it will hang as low as possible on the nose. The neck yoke, described on page 235 of the *Agriculturist* for November, 1865, is effectual. This arrangement is very simple; eight round hard-wood sticks, $\frac{3}{4}$ of an inch in diameter, are arranged to form two square frames surrounding the cow's neck, and held about 10 or 12 inches apart, by driving them into holes bored at right angles to each other near the ends of four $1\frac{1}{2}$ inch square sticks, also of hard wood. This entirely prevents the cow bringing her head around to her side.

Artificial Mother for Chickens.—When chickens are artificially hatched, either by turkeys or by the heat of warm water, artificial mothers are needed to brood the chickens. "G. F. G.," of Kalamazoo, Mich., describes one which he uses, as follows: "A thick woollen blanket is hung by the corners in some sheltered, dry place, so that about 3 feet square will rest upon the ground or floor. A mother hen is suspended in a box above the centre of the blanket, and the chicks feed around the outside. The clucking of the hen will call them towards her when they need brooding, and as in seeking the hen they cluster in piles under the centre of the blanket, the mutual warmth imparted is sufficient for all purposes. When the flock is large, if the outside ones become cold, they work their way to the centre, and it is only necessary to use the hen for a few days."

Preserving Eggs.—Take a bread-pan or other pan, put slaked lime into it, till it has enough to allow the eggs to stand upright, small end downwards. As soon as the layer is completed, fill up till they are covered and there is an even surface. When you have enough eggs to make another layer, put in slaked lime sufficient to be filled up by the eggs you have ready. You may continue till the pan is full. If the eggs are put in fresh, you may keep on, and they will be fit for breakfast at any time, and be like new-laid eggs. But if they are stale when put in, this process will not restore them.

lice on Cattle and Sheep.—The spring is the season when most annoyance is caused by these parasites. We have so many letters asking for and recommending cures, that we are induced again to allude to that wonderfully effective destroyer of such vermin, *Carbolic Acid*. This is used in the form of soap, which may be easily applied in water, making a moderately strong suds. Cresylic acid is a cognate substance, almost always associated with carbolic acid, and under the trade name of "Cresylic Soap," an excellent article is advertised and furnished. We have employed this soap to rid our shelves of ants, our embayments of cockroaches, poultry of lice, dogs and cats of fleas, and not having occasion to use it upon our horses or neat stock, have supplied acquaintances whose stables were infected. We have even prescribed a bath of Cresylic Soap and water for a newly arrived immigrant, and in every case of its application have had the satisfaction of learning of its efficacy. Farewell to mercurial ointment, that efficient, but very dangerous article in careless hands! So long as we can obtain carbolic compounds, we banish it.

Walnut Worms.—"Subscriber." Pomeroy, Ohio. We cannot tell how to preserve your Walnut trees, unless we know what worm infests them. Next season, put some in a box with leaves, and mail to us.

Darwin's Variation of Animals and Plants Under Domestication.—Since our announcement of the reprint of this work was in type, the London Gardeners' Chronicle has come to hand with an extended notice, from which we extract the following: "Mr. Darwin's work on domesticated animals and plants, whose appearance we announced a fortnight ago, is one of such importance to both the practical and theoretical gardener, as well as to all persons with whom the gardener is most closely associated, professionally and social-

ly, that it must claim a large share of our attention, no less on this account than for its special merits, and the stores of information it contains. Written in admirable English, using no scientific terms but such as are comprehensible to men of fair education, lucidly arranged, and indexed with scrupulous care, there is not a gardener in the country who has any taste for the history or theory of his art but will peruse it with pleasure and profit, and find it difficult to say whether he values it more as a store-house of facts or as an incitement to observe and to think. Is his employer a sportsman? he will find in Mr. Darwin's pages such information regarding dogs and horses, their breeds and individualities, as never entered the brain of the gamekeeper, equerry, or master of the hounds. Is he a farmer? here are anecdotes and observations regarding cattle, pigs, sheep and goats, which no professional breeder can match for number or truth, and which too few of these will believe or care about, not because they are not true, but because most so-called practical men take no interest in animals beyond what immediately concerns themselves. Is my lady a fowl fancier, or has she an aviary? her gardener will here find a wealth of information on domesticated birds of all sizes, voices, and uses, from the canary bird and peacock to the turkey and goose. Lastly, do his master's children seek his advice about their rabbits, pigeons, honey bees, goldfish, or silkworms? If they do, here are curiosities of natural history about each and all, treated with masterly skill and originality. With regard to these zoological subjects, we must confine ourselves to recommending the study of them in Mr. Darwin's pages to those who have time to do so, and proceed briefly to expound the purpose and method of this remarkable book in so far as it is devoted to the vegetable kingdom."

A Novel and Useful Enterprise.

For many years we cherished the idea of securing in a central city location, a large room, where, in connection with our office, we could have room for a sort of Agricultural and Horticultural Museum or show-room. The great increase in our publishing business has rendered it impossible to give the needed time and attention required to organize and carry out such an enterprise. Recently Mr. L. B. Whitlock, (the son of our old friend and instructor, Prof. Whitlock, now deceased) has hit upon a similar idea, without any hint or word of suggestion from us. He has leased the first, second, and third floors over the main *Agriculturist* Office, 245 Broadway, each floor 114½ by 25 feet, with extension upon Murray street of 25 by 12½ feet. Here he proposes to receive on permanent exhibition samples of implements of all kinds pertaining to soil culture, where they can be examined in connection and at leisure by citizens and visitors—a kind of perpetual Fair, and also provide room for meetings or gatherings of cultivators, horticulturists, fruit growers, for conventions, discussions, etc. The enterprise seems to be a very desirable one for all classes, and with Mr. Whitlock's enterprise, fertility of plans, industry, and good intention, we can hardly doubt that the scheme will prove highly successful. The locality is one of the best in the lower or business part of the city—nearly opposite the City Hall, and fronting upon Broadway and the open Park. For particulars see Mr. Whitlock's advertisement.

Heating Manures in the Hill for Potatoes.—The use of hen-manure composts, night soil, or even barn-yard manure, in the hill or drill with potatoes, is rarely or never advisable. It is much better to distribute it evenly through the soil. The best practice is to use no fermenting manure except such as might have been incorporated with the soil the autumn previous. Wood-ashes and plaster, either or both produce almost invariably good effects. Castor pomace and Fish-guano, both oily manures, may, perhaps, be regarded as exceptions to the rule. "No fermenting manures in the hill for potatoes"—for they frequently produce good crops.

Interesting Figures from Our Mail Rooms.—The Chief Clerk furnishes the following figures from his book, showing the actual work expended in mailing a single number of the *American Agriculturist*: Folding and Stitching, Girls' Work, 200 Days. Writing Wrappers, Men's Work, 50 Days. Enclosing in wrappers, tying, and jacking in Mail-bags, Men's Work, 65 Days, Boys' Work, 25 Days—in all 91 Days. Total days work, 577, equivalent to 53 persons during 10 days. About 500 Mail-bags, holding 4 bushels each, or 2,000 bushels, are required. Weight of the papers when ready for the Post-Office, 18 tons! These are scattered to every part of the Continent, an average of nearly half a dozen to every Post-Office in the United States and Territories, and the British Provinces, besides large numbers to every part of the world wherever the English or German language is read. Large bundles go to South America, the West Indies, Australia, the Sandwich Islands, various parts of Asia, and even to Africa.

The Department of Agriculture.

—We have before us three documents which show that Col. Capron is earnestly attending to agricultural interests. One is a report on the manufacture of Beet Sugar, showing its importance in other countries, and the necessity of an investigation that will facilitate its introduction here. Another report is in favor of a remission of duties on animals imported for the purpose of improving the stock, and a third for the removal of restrictions upon the importation of new plants, seeds, etc.

Standard of Excellence in Poultry.

—We have received from Mr. A. M. Halsted, Secretary of the American Poultry Society, a pamphlet containing minute descriptions of all the breeds of poultry recognized by that Society. It is the same as the standard adopted by the London Poultry Club, and published in Teggmeister's Poultry Book, with "Alterations and Additions adapting it to America." Accurate knowledge of poultry is a rare qualification of judges of poultry at our fairs, and this publication, or something like it, should be placed in the hands of every one, as a guide in deciding upon the merits of fowls exhibited at our fairs.

The Buckeye Mower and Reaper.

—We offer as a premium one of the best, if not the very best, machine in the country, regarded either as a mower simply, or as a combined machine. Every year our judgment in selecting the "Buckeye" is confirmed by the prizes which are awarded to it at fairs and trials in all parts of the country. It was not sent to the Paris exhibition last year, because the proprietors have not taken out European patents, but it is a satisfaction both to them and to us that the machines which received the grand awards use those peculiarities which distinguish the Buckeye here. This is one of the most important premiums we offer, and a few weeks of energetic work for the *Agriculturist* may put several young farmers in possession of one of these excellent implements, with all desirable improvements, before laying and harvest time.

Draining Tile.—"R. E. W.," of Wyoming, Penn., says he has been reading Draining for Profit, and, of course, has the fever. Col. Waring recommends only round tiles. These are not to be had nearer than Albany. What is to be done? Do the next best thing—use sole tiles, and if you cannot do better, use horse-shoe tiles. If these cannot be had, two four-inch boards nailed together like a roof or a V inverted, will last a great many years. The use of boards was recommended by our correspondent "L.," of Morristown. The views of our Morristown correspondent are usually right.

—We have before us three documents which show that Col. Capron is earnestly attending to agricultural interests. One is a report on the manufacture of Beet Sugar, showing its importance in other countries, and the necessity of an investigation that will facilitate its introduction here. Another report is in favor of a remission of duties on animals imported for the purpose of improving the stock, and a third for the removal of restrictions upon the importation of new plants, seeds, etc.

Market Price for Corn Husks.—

"G. T. E." This differs much in various parts of the country. The husks are used extensively in upholstery. A good clean article ought to bring ten dollars and upwards at the mill. The husks are run through a hackle, and then pressed in bales about the same size as hay bales, and in this condition are sent to the New York and other markets, where they bring about fifty dollars a ton. The commission merchant sells for seventy dollars a ton. It will be seen from this that the manufacturer and the merchant have the largest share of the profits. The remedy is a neighborhood hackle mill, owned by farmers.

A Peat Swamp Burnt Out.—"I. O. D.," of Lansing, Cook Co., Ill., writes: "I have about eighty acres of peat land that took fire in August last, and has continued to burn to this date, with no prospect of stopping until the marsh is all consumed, unless copious rains quench it. There was about two feet of peat, and there is now (March 4th) where it is burned, fifteen inches of ashes lying as light as newly fallen snow. What shall I do with it? The subsoil is sand, and the fire has in most places burned all but the sand. As the land is not fenced, and as I am not flush of funds, do not like to risk reed, labor, and fence, unless there is a good prospect of getting a crop." *Ans.*—One thing you can surely do—that is, let it alone. This we advise, unless you can assure yourself, before time to set out cabbages, or plant turnips, or possibly plant corn or potatoes, that the outlay will pay. Let it lie, and try a few experiments with it. We presume it will prove very valuable land.

If the New York Independent

shall hereafter advertise itself as a "Religious Journal," or lay any claim to that character, after placing before its readers such an advertisement as filled out the whole of its 5th page in glaring type, on Feb. 20th, we think the American Bible Society should promptly send to the office of the paper a large type edition of the Scriptures, to the end that its editors or publishers may be able to learn the first principles of true religion, Christian principle, and common decency. We have no quarrel with

the Independent, on general grounds, but in behalf of outraged public morals we should feel obliged to advise every family in the land to shun the paper, and to provide a long pair of tongs with which to seize and thrust into the fire every copy that may chance to find its way to their dwellings, unless there is at once a guarantee that its advertising pages shall not hereafter counteract and render ridiculous the religious teachings of its reading columns. We are glad to see the Christian Intelligencer's earnest protest, and to know that its own advertisements are usually so guarded that it is not compelled to hesitate to throw the first stone at the Independent—as, alas! too many professedly religious papers are obliged to do.

Distillation, Brewing, and Malting.

—A small volume with this title, issued at San Francisco, we have read through, expecting to find some useful information for a novice, but are disappointed. It contains general statements, but lacks the minute and illustrations required to make it generally useful. The book is not particularly recommended by such statements as the following: "During the continued and despicably puerile maladministration of the British revenue officials, while they, by erroneous, pertinacious, and persistent official oppression, fast blighted the growth of revenue, —while they paralyzed and ruined the licensed distiller, precisely as the United States' rule is now doing," etc. Here, as elsewhere in the book, the adjectives are piled on with a vengeance, for a pretended scientific treatise.

Grass Seed for Reclaimed Salt Marsh.

—W. S. Hayes, Del., wishes to know the quickest way to get salt marsh into the fresh grasses after the tide gates have been put in. It is not necessary to plow, as many suppose. The surface of the marsh is a soft and spongy bed, where the seeds readily sink and germinate. Any grass seed that is desired will grow. We have used White and Red Clover, Red-top, and Timothy, and they have all done well. We prefer a mixture of grasses, to make the largest yield and the best quality of hay. Sow the seed from 15th of March to 15th of April, or in August. It is better to have the sea water shut off six months before the seed is sown. This whole subject has been frequently discussed in back numbers, which can be forwarded by mail on application to interested parties.

Bringing Water into Houses and Barns.

—F. S. Hill, N. J. Where the fountain is higher than the house, the water may be carried in wood, metal, earthen, or cement pipes. If the stream has sufficient fall, the water may be brought in by a ram from a point lower than the house. For this purpose an iron or lead pipe is more desirable than wood or cement, and the difference in cost is not worth estimating. Cement pipes do very well for carrying water from higher points to lower, and are rapidly gaining in popular favor. We should not like to trust them to bear the constant shocks of a ram. Parties who have water rams for sale generally keep pipes to go with them, and can furnish reliable information as to comparative cost and durability. With a reservoir in the house large enough for a day's supply, a small pipe will answer.

How to Get Big Crops.—

—As a rule, farmers are much more anxious to get big prices than big crops. There are few farms whose average production could not be doubled in a very short time by more capital and labor. It is safer to use capital in farming than in almost any other business. The credit of the plow is quite as good as that of the boom or the anvil, and the capital will come if it is called for. Use more manure, and get thirty bushels of wheat where you now get fifteen, and eighty bushels of corn where you now get forty. The quantity of grain grown per acre is mainly a question of manure and tillage. A big compost heap makes a full grain bin. With high manuring, the soil needs deeper stirring and a gradual bringing up of the subsoil to the surface. With the present horse-harrows and cultivators, nearly all the cultivation can be done by horse power, at a great saving of expense, and a great increase of the crops. Plan for big crops this season.

High Farming without Stock.—

"J. M. B." of Maryland is fully satisfied of the advantage of clean and thorough culture for corn, and of high farming, but would like to see a series of articles discussing restoring and keeping up land by commercial manures without feeding stock. They have not barns and other conveniences necessary to feed cattle in winter, and as every negro is privileged to keep two or three worthless curs, sheep feeding is attended with much care and anxiety. A farmer is apt to start every time he hears a dog bark. We will not give advice on the subject, but have little doubt that Peruvian and Swan Island guano of good quality might be used with profit on barley, to be follow-

ed by wheat, seeded down with clover. But, of course, if the straw and corn fodder, and especially the clover, were sold off the farm, the system would soon impoverish the land. And it seems to us that with easy access to the best markets in the world, some plan of feeding stock might be discovered that would be profitable. In the meantime one thing is certain: as long as large crops of clover can be grown, we may be sure, by plowing it under, of raising good crops of corn, barley, and wheat.

Information about Fertilizers.—

Mr. B. asks: "Cannot the editors of the *American Agriculturist* give us correct information in regard to the merits of different commercial fertilizers without fear or favor? The manufacturers might be angry, but the farmers would be benefited." We would gladly do so, but the subject is surrounded with difficulties. The best plan is to buy only from responsible parties, and insist on a guarantee in regard to the composition of the manure. Keep a sample in a tightly corked bottle, and if there is afterwards reason to suspect that the manure was very poor, have it analyzed, and if it is inferior sue for damages.

Condensed Milk Factories.—

"F. L.," Vt. The use of condensed milk is greatly on the increase, both in this country and in Europe. The "condensing process" is patented, and several different companies are engaged in the business, using different patents. The condensing is done in the country, in districts where milk is cheap. There is the same advantage to farmers in one of these factories, as in a cheese or butter factory. It makes a home wholesale market for milk, and saves much labor in the house.

Maple Sugar.—

—According to the last United States census, about forty million pounds are made in the whole country, and one and a half million gallons of syrup. The New England States, New York, Michigan, and Ohio, make the most. Nearly one-half of the whole quantity is made in New York and Vermont. The value of this product at the present market prices is not far from eight millions of dollars. There is no good reason why more system should not be introduced into this industry and the business be greatly extended. Why should not better varieties of the sugar maple be sought out and multiplied by nurserymen, and orchards be planted on a large scale? There is no danger of a glut in the sugar market, and if the product were multiplied ten fold the price would still be remunerative. The tree will flourish in elevated positions and on rocky land quite too rough for tillage, and its cultivation requires very little care.

Landreth's Garden Seeds.—

—Messrs. Landreth & Son send us a series of specimens of the produce of their seed farm. The reputation of these gentlemen is such that we shall sow these seeds in full confidence of obtaining excellent results.

Early Cultivation of Potatoes.—

—Much labor may be saved by running a bush harrow over the ground just as the shoots are breaking through. This will disturb the whole surface of the ground, and is equivalent to a good hoeing. A week or ten days later go between the rows with a cultivator, and if the young shoots are covered deeply with dirt it will not harm them. The early sorts will only need cultivating once or twice more, and this can be done by horse-power. Early and frequent cultivation makes cheap potatoes.

Triplets.—

"J. B.," writes: "J. H. Dickman, near Richmond, Indiana, has a cow with triplet calves, which are fine, healthy animals, and at last accounts the dam and trio were 'doing well.'"

The Sabbath School Index, by R. G. PARDEE.

published by J. C. Garrigues, (\$1.25.) is a useful book for all Sabbath school workers, and may well be selected by all who feel, or should feel, the importance of this field of labor, and desire to secure all the aids possible. It "points out the history and progress of Sunday schools, with approved modes of instruction, examples in illustrative, pictorial, and object teaching; also the use of the black-board, management of infant classes, teachers' meetings, conventions, institutes, etc., etc."

Sugar Consumption.—

"G. B.," La. There is no danger of an over-production of sugar for many years. The United States and Great Britain consume about 1,420,000 tons annually, or forty-one pounds to each inhabitant. In Southern Europe, the consumption is about twelve pounds per head, and in Germany, about seven pounds. If the consumption were to be brought up to the standard in this country, it would take at least three times the present crop to supply the demand.

What to Grow and How to Grow it.—C. T. K., Montgomery Co., Pa., is a teacher with some leisure time, can have one-quarter to one-half an acre of land, and asks, "What to plant, how to cultivate it, etc., so as to render it most agreeable, interesting, healthful, and profitable." This is one of many cases in which we are asked for advice which cannot be given without an acquaintance with the person's skill, experience, and immediate surroundings. To one who has a love for plants, it will be "agreeable and interesting," and we may add "healthful," to grow anything from cabbages to roses. If by "profitable" is meant the amount of money to be realized from the place, the things to cultivate will depend upon one's knowledge and the demand of the neighborhood. Raspberries and strawberries would pay, and if in a populous region, raising seedling plants of cabbages, tomatoes, peppers, etc., with hot-beds or cold frames, strawberry plants, etc. The "how to cultivate" we are telling all the time, and there are books containing full instructions on these points.

A Mineral "Curiosity."—L. H. D., Burlington, Col. Terr. The specimen sent is hardly a curiosity to those familiar with minerals. It is a form of Asbestos, of which there are several varieties, some quite as silky in texture as yours, but pure white. It has been woven into cloth, which is incombustible and may be cleansed by burning. It is said that the ancients used a cloth of Asbestos to wrap the bodies of the dead when about to be burned, to prevent their ashes being mixed with those of the funeral pile.

Alton, Ill., Horticultural Society.—This Society is very much alive, and sends out its proceedings at once, on a well-printed sheet. There is some excuse for this, for there are always something to print and useful to read. The proceedings for the 7th of February contain an excellent essay on the curculio, by that well-known orchardist, Dr. E. S. Hall.

New York State Grape Growers' Association.—The Grape Growers of N. Y., to the number of seventy, met at Canandaigua on the 27th of February last and formed an association with the above name. The Hon. Emory B. Pottle of Naples is President, and Dr. E. K. Van Keuren of Hammondport, Corresponding Secretary. An exhibition of grapes will be held in Canandaigua next autumn, at which competition is invited from all parts of the United States and Canada.

Forcing Strawberries.—"Subscriber." Preparation must be made the autumn beforehand and the plants well established in pots before winter. The full details of the process, with description of the necessary structures, is given in Fuller's Small Fruit Culturist.

Alibuths.—The Country Gentleman says: "We know nothing of the value of the Alibuths as a timber-tree, but should suppose it not to be of much value. It grows rapidly and suckers freely, and will succeed on soils too poor for many other purposes. The pistillate trees bear a profusion of seeds, but as there is very little call for it there is probably none in the market." It is not often that friend Thomas gets so far off the track, and we put him right and answer a correspondent at the same time. The Alibuths is valuable for timber; the wood is hard and does not decay readily; is excellent for vineyard stakes; and is good fuel. It does not sucker badly unless the roots are injured. Seed is to be had at Thorburn's, and probably of other dealers.

Knots on Cherry Trees.—"J. A., Hunterdon Co., N. J. The knots on your sour red cherry trees are the same, or practically the same, as the black-knot on the plum. The free use of the knife on their first appearance is the only successful remedy.

Propagating the Maple.—O. Moffat, Iowa. The Maples are easily raised from seed. Both of the Soft Maples ripen their seed in May or early in June, and it should be sown at once. That of the "hard," or Sugar Maple, ripens in autumn; it may be sown then or kept in a cool place until spring. As to care, young trees need hoeing, weeding, and thinning, like any other plants, and it will be useless to plant Maple or any other seeds unless this care can be given the young plants.

A Little Girl's Letter.—Miss E. A. O. writes from Albany, Ill., and though she asks us to correct her letter, we shall not do it, but give it as a specimen of the many words of appreciation that we get from the little folks. "I write to tell you how well we like your paper, the *Agriculturist*. We have taken your paper for several years. My Ma says she has been a better house-keeper ever since she commenced reading it (but I guess she must have been a very good one before). We have such a nice place, one half mile from the Misses' sep-

pi river and Albany railroad station, and such fruit as we have! We do have some of the nicest Raspberries, Strawberries, Currants, Gooseberries, Cherries, Grapes and Apples. Ma says we learned how to raise them by reading the *Agriculturist*. Ma tells us so. Pa got up the club last year for the *Agriculturist* and received the garden seeds. Ma says we had the best garden we ever had before. Oh, I must tell you about the Chickens too, we raised a great many last year, I can't tell how many. We have fresh eggs all winter. Ladies often say to my Ma when they come here, how do you get fresh eggs all winter, and she tells them by reading the *Agriculturist*."

The Tomato Question.—The discussion of the relative values of the different kinds of tomato, as shown by last year's experience, is no longer timely, and the many friends who have written us upon the subject will excuse us if their communications are not published. The seeds for a new crop are sown by this time, and we shall be glad to hear what another season's trial has developed. Those who ask us to expose certain varieties as "humbugs" should recollect that a single season's trial in one locality will not warrant their condemnation.

A Large Price for Potatoes.—Mr. D. S. Hoffman of Utica, N. Y., sold in February last to a party in New Jersey, one hundred and fifty bushels of Early Rose Potatoes for *Two Thousand Dollars!* Over sixty dollars a bushel is a good price for potatoes, and the sale is worthy of note, as it shows that a really good variety will pay the originator for his trouble in producing it. The fact that really meritorious fruits, flowers, or vegetables, meet with a ready appreciation, should encourage judicious experiments in producing them.

Hedges.—"H. N.," Huntingdon Co., Pa. The method of lopping the Osage Orange to form a hedge described in October last, is approved by the large planters at the West, as cheap, quick and efficient. We have an article on the subject from a practical hedge grower which we hope to give soon. The Honey Locust makes an excellent hedge, and will stand the winter in portions of the country where the Osage Orange will not.

Mixing of Vegetables.—"O. M.," Ottumwa, Iowa. Potatoes do not "mix" in the hill. Peas and Beans rarely mix when grown near each other, but sometimes do through the agency of insects; the same with tomatoes. The different varieties of Onions, Parsnips, and Beets, will be likely to cross.

Black Knot.—"Subscriber." The "cause" of the Black Knot is a fungus; the remedy is to cut and burn the limbs as soon as it makes its appearance. F. Manten, Mo., states that his plum trees on richly manured soil are affected by the knot and that those on similar soil, but unmanured, are exempt. He asks if this is the experience of others.

Silver-leaved Maple.—A. G. Wood. The tree of this name is a native of this country (*Acer dyscarpum*) and is also called White Maple. The soft Maple of the East is *Acer rubrum*. The most common maple used in cities is the Norway Maple, *Acer platanoides*.

Tying Material.—D. W. Tainter, Mo., asks what material is used at the East for tying vines. For arns, osiers are generally used, and for tying in the new growth, a good cotton twine—not the cheap stuff that is half straw—is often used. Mr. Knox uses ryegrass straw, which is made flexible by dampening this is put on with a twist, rather than a knot, in a way that is not easy to describe and would be difficult to figure. The material used at the East for tying asparagus is best bark, the inner bark of the Linden. Cuba bast is from a different tree. Either would answer. It is sold by seedsmen.

The Hair Worm.—The hair-like worm, *Gordius aquaticus*, has ignorantly been supposed to originate from a horse-hair. It was bad enough to have its parentage misrepresented, but it has met with a worse fate at the hands of a quack pill man, who figures the innocent worm, and says: "It is given here that its bite may be guarded against, as it produces the felon or whitlow, when the blood is at all impure." Then, as a matter of course, follows the advice to take the fellow's pills to keep the blood pure. When a hair worm does bite no doubt terrible consequences follow, only it don't and they don't.

Moving Evergreens.—G. H. Lounsberry, Hamilton Co., Ohio, says: "I have some evergreens, about 10 years old, and about 20 feet high. They are too near my house, so I wish to move them. What is my best plan? I am advised to dig a trench around each, pour in water, and let the earth freeze to the roots, and

then move them. I am afraid of the advice." We should not try the frozen ball plan, but wait until the buds begin to swell, and then remove them with as little mutilation of the roots as possible, on a damp day. If the work cannot be done in moist weather, be sure and keep the roots thoroughly damp, or even dripping wet.

Queer Apples.—D. B. Carpenter sends us from the ranch of J. Q. A. Ballou, San Jose, Cal., a singular cluster of apples—one apple as large as a fidget, with three smaller ones arranged around it, and all placed directly on the bark near the middle of the body of the tree. We at first thought they might be a kind of fungus, but a careful examination showed them to be apples.

Curculio.—Henry Stett, Leavenworth, Kan. The curculio does not confine itself to the plum, but other fruits, apples even, are attacked by it.

Canker Worm.—David Lyman writes: "The a strip of cotton batting, a few inches wide, around the tree with one string, and turn the top and bottom out so they will be flaring. The insect gets entangled and must deposit her eggs in the cotton. In the spring, water and burn. One of our most reliable men, Benj. W. Coe, of this place, tried it last year with perfect success."

Earthworms in Flower Pots.—"H." says: "If your correspondents who are troubled with this 'epidemic,' will apply a weak solution of salt in water a few times, they will destroy the worms, and benefit the plants." We fear that most persons would use too strong a solution, and we think lime-water preferable, as that cannot be made too strong. Perfectly clear lime-water, and not milk of lime, is to be used.

How to Study Botany.—W. K. Tipton and several others. Get Gray's Lessons in Botany and first thoroughly learn the structure of plants, and then with the same author's Manual you will soon be able, with a little practice, to identify any of our wild plants.

Trees for Southern Wisconsin.—"J. E. M.," Spring Green, Wis. For trees around the house, Norway Spruce, White and Austrian Pine for evergreens, Sugar and White Maple and Elm for deciduous trees. These are all perfectly hardy and easily obtained.

Lima Beans.—William Smith. These need a rich, warm soil; set poles four feet apart each way, when the ground is well warmed and cold rains over, put four to six beans to each pole, pressing them into the soil, with the eye down, about an inch deep. They may be had earlier by starting under glass on rods. See "Kitchen Garden" for last month on page 83.

The Blue Jay Indicted.—W. Reid of Wis. "I have seen them sucking hens' eggs and birds' eggs, and destroying young birds in the nest. They are great fruit thieves, and they swarm in scores around our corn cribs, both summer and winter. I do not know a redeeming trait in the Blue Jay's character."

Cranberry Queries.—"H. C. S." It is not possible for any one to tell you how much it will cost to prepare land for cranberries without knowing its present condition, as some costs three times as much as other. The meadow should be in fair bearing in three years, though some fruit is borne earlier. Three hundred bushels to the acre is considered as an average crop.

Retarding Peach Trees.—A correspondent writes us that last winter, after the ground was fairly frozen, he placed litter around his trees to prevent the early thawing of the soil around their roots, and thus retarded their starting until danger of late frost was over. One experiment seemed so favorable that he proposed to repeat it this winter. Please give us the results.

Box Edging.—R. Antkele, Delafield, Wis., says he has no difficulty in raising box from cuttings. He makes a trench about six inches deep, uses entillings 6 or 8 inches long, and sets them deeply and so close together that the foliage forms a continuous line. The earth is packed firmly on both sides of the row, and the plants watered during the first two or three weeks.

West Jersey Fruit Growers' Association.—Fifth Annual Report for 1897-1898. The West Jersey Association comprises the fruit growers of Burlington Co., near Philadelphia. Their proceedings are always welcome, for we know as we open the unpretending volume, we shall get fruit for a living, and have a sharp eye to profits; they give their experience in a few words, and we can commend their reports as models.

"Extra Farming."—"J. P. G." of Blair Co., Pa., asks if we think it "extra farming" to raise 300 bushels of Early Goodrich potatoes, or 520 bushels Cazo, to the acre—the one being 52-fold, the other 75-fold, the seed? This he says was done by Dr. Rowan Clark on a sandy loam manured with stable manure, composted with coal ashes.—Certainly this *extra-not extra* beyond anything we ever heard of, but extraordinary for this period in the history of potato culture, and especially so for the past season. The same writer mentions a calf killed at 7 months 3 days old, which weighed alive 1182 pounds and dressed 774 pounds "clean meat."

Rutabagas.—"W. H. H." Allegheny Co., Md. "In raising rutabagas for stock, do you sow the seed in a bed and transplant them like cabbages,—or sow them like turnips where they are to grow?"—They will do tolerably transplanted, but better sown where they are to mature. Transplant only to fill out spots where the seed has failed. The crop is seldom sown before the middle of June even at the North.

Working over Manure.—"Knoxville," writes: "I am in the habit of drawing the manure from my hog pens, cattle stables, and horse barn, directly to the field where most wanted, every spring and fall. If I should simply mix the kinds together under a shed, and leave it six months or a year, forking it over once or twice, would the increased value pay for the extra work?"
Answer.—For some purposes it would, but great care would need to be exercised to prevent serious loss from overheating, which it would almost surely do, unless it could be kept moist under cover, or well trodden down in a pile. For ordinary field crops, when it is to be plowed in, there would be no advantage. For top-dressing grass, harrowing in upon the surface of land for wheat or flax, or for the garden, no doubt the additional labor would pay.

Labor and Profit in Farming.—"H. I." of West Chester, Pa., expresses his distrust of the statement that six laborers employed upon a farm is the secret of its profits. We have not the details of the farm in question showing just how much of it is profit, but we have no doubt of the general principle, that the more labor we employ upon our farms the more profitable we make them. One man and a boy for a farm of two hundred acres does not pay very well, even if the land is smooth and we use the improved implements in tillage and harvesting. If fruit or truck farming is followed, much more labor is required to the acre than in grazing or grain growing. The road to wealth is found in applying more manure and more labor to less land, rather than in applying less labor to more land, which is the popular maxim in America. The most profitable farming we know of is where labor is most liberally expended in making manure, in drainage, in subsoiling, and in thorough cultivation. It is time farmers had faith in their business and put more capital into it.

Horticultural and Other Societies.—"We have taken unusual pains to procure a tolerably complete list, with officers' names. The Secretaries seem to be indifferent to the matter, and the reports of meetings are generally unsatisfactory. The Jefferson Co. Mo. Society is reported as having elected "Tom Walker" President, but neither his address nor that of the Secretary is given. The Kansas State Hort. Soc. has elected "Mr. Tanner," of Leavenworth, President—and so on, in the most indefinite manner.

Grinding Bones.—"X." asks: "Would a common 'corn and cob crusher mill' similar to the kind known as the Little Giant, be of any lasting service in grinding bones for manure?"—No. It requires a stronger mill, and more power than such a mill can stand. The best way is for several neighbors to make joint-stock property of a good bone mill, set it up where there is water or steam power, and grind for themselves and others.

Canada Thistles.—"J. H. Gray" writes that his neighbor keeps his sheep in the fields containing the thistles, scatters salt freely over the thistles, and the sheep keep them in subjection. This would doubtless do where the patch is small, but we should not like to buy the salt for some fields we have seen. S. Reynolds, of Maquoketa, Iowa, thus pleasantly writes on the subject: "I once owned some farm lands in the eastern part of N. Y. State, well covered with thistles, as were also all adjoining lands; these I sold some years since—right and title to lands—and thistles too—and this got rid of them, and followed 'the Star of Empire' as far as Lockport, N. Y., and in a short time found thistles there on my farm, on a rocky piece of about half an acre. I made a pasture lot of that for two successive years, and salted my sheep and cattle on the heads of the pests, and they disappeared from that quarter by diligent attention. But I had neighbors, (as most people have,) who were contin-

ally turning out pest seeds, like scandal without parentage, to be wafted with the winds wherever they would. I soon found other patches, and the same means produced the same effects, (on the thistles, I mean.) Not so of all others, for I found the difficulty of the boy catching birds—the right kind of salt, and then to get it on their tails. I have 'left all, the wine and the oil, (of butter,) the sheep and goats of the flock, and followed that 'bright particular star,' to where the presence of the Canada is not as yet, but where good bread and butter are to be had in abundance by industry, and shame from wearing patched garments is no hindrance to honest thrift. Never much Canada thistles; they love it. If they are common all about you, leave them, for they will never leave you, not even in your grave, for they will root deeper than that. If a small patches, they can be overcome by salting the herds on their heads for two seasons, if properly attended to; but if negligently, it is of no use." The Gardener's Monthly takes us "up" for warning people that the thistle is spreading in the "West." In a journey of 3,000 miles, (going and coming, and across lots,) our friend Meehan did not see any. He has travelled to some purpose if he has found out where "the West" is, and we advise him to turn his attention to discovering that hitherto unseen country, "down East." Trust our associate saw Canada thistles in his western trip, we do not doubt. The writer has seen them in Michigan—which is pretty well "West," and believes that the Legislature of that State has passed a law to prevent their spreading.

Increase of Foxes and Woodchucks.—A Massachusetts correspondent complains of these animals in consequence of the stringent dog law. The remedy is a heavier bounty upon them. Men were always better hunters of these animals than dogs, before the law was passed, and with a bounty heavy enough, any neighborhood will soon be freed from them. Of course, they will multiply if nobody hunts them. Caterpillars will soon destroy an orchard, if their nests are not disturbed. Foxes are best captured in their holes when young, and woodchucks are readily destroyed at any time.

The Dark Ages Still in England.—"The Leicestershire (Eng.) Chamber of Agriculture, after long deliberation, has declared against intellectual improvement among the agricultural class, on the sole ground that they would be less efficient as laborers. It therefore opposes the education of the children of agricultural laborers." The ignorance of this class is their great defect over here. John Bull is still doubtful about the mowing machine; he will get to it a century hence.

Kicking Cows.—"H. L. T.," Media, Pa., recommends putting calves to them for the purpose of fattening for the butcher, especially in winter, when veal is high. He has fattened two upon such a cow, selling them for \$17 and \$20. It is very rare that a cow cannot be cured of kicking, by firm and gentle treatment. Put her in stanchions, raise one of the fore legs, slip a strap over the braced knee, and keep it in place by thrusting a pin between the strap and the joint. She will find kicking very difficult, and if there is no noise and no abuse, she will soon be cured. Kicking men make kicking cows.

Ambas Americas.—Both Americas; an Educational, Biographical and Agricultural Review. This is the title of a periodical in the Spanish language, published in New York. It is under the direction of Señor D. F. Sarmiento, Minister of the Argentine Republic, and is intended to make the South American Republics better acquainted with our educational systems, our agricultural improvements, and the like. It could not be in better hands than those of Señor Sarmiento, for it would be difficult to find one who is so thoroughly alive to the importance of popular education, or who more readily appreciates every improvement in agriculture and the arts. The two numbers before us give a good variety of matter, with illustrations of our school-houses, agricultural machines, etc. We are glad to learn that the periodical meets with appreciation in the South American States, and we wish it every success.

Breaking Up Prairie Land.—"H. R. H." inquires the best time to break up dry rolling prairie sod, and the best crop to put on. These, and the best mode of breaking new prairie sod, are practical questions, upon which a comparison of the views of the experienced is desirable. Please let us hear from such.

Onions and Carrots.—"J. S." A favorite way of growing onions about Narragansett Bay, R. I., is to cultivate them together with carrots. The onions are sown about the 1st of April, in rows one foot apart, and the carrots about June 1st, in every third space between the rows, making the carrot rows three feet apart. The onions are taken off early in August, when the carrots have the ground. As carrots make the most of their

growth after the middle of August they have ample time to make a good crop. The yield, in good soil and with good treatment, is about 500 bushels of onions, and 400 of carrots to the acre, worth from \$80 to \$90. We have tried this succession crop several seasons, and have no doubt that it is the best way to get cheap onions and carrots. We have sometimes planted the carrots between every two rows of onions, but this diminishes the yield of onions somewhat and increases the cost of cultivating the carrots, as it has to be done by hand. If left three feet apart the horse cultivator can be used. Of course when two crops are taken in a season, manure must be used very liberally. At least forty loads of stable manure, or its equivalent, should be put on, and this will pay much better than little manure and small crops.

Professorship of Agriculture.—Hon. E. W. Cook, of Havana, N. Y., has recently endowed a chair of Agriculture in the People's College, and the Trustees resolved that it should be known as the "E. W. Cook Professorship." The college has a fine farm of over 100 acres attached to it, and it is intended that the instruction shall be practical as well as theoretical.

Setting a Forest.—"F. M.," Wayne, Me. If you have good land and wish to set a forest "partly for the pleasure of it and mainly for fuel," by all means take the Sugar Maple and don't bother with Alnus, White Willow, and Cottonwood, which we only recommend for their quick growth where shelter is the main object. With a Maple grove you can have pleasure and fuel with the sweetening added. We should much like to hear of a well-conducted experiment in Maple planting. Set the trees much thicker than they are to stand finally, as the thinnings will give a constant supply of fuel.

Blood as a Fertilizer.—Lewis Lawshe of Georgia says: "I have the blood of about 1000 hogs mixed with dry duck, at the rate of one peck of ducks to one gallon of blood. How can I apply it to garden truck?" Fresh blood contains not far from 90 per cent. of water. A gallon weighing, as it does, not far from eight pounds, will contain a pound and six tenths (1.6 lbs.) of dry matter, of which about 15 per cent. is nitrogen. Therefore six gallons will contain about one pound and a half of nitrogen. The addition of a gallon of blood to a peck of dry duck will not increase its bulk, so we may reckon that six pecks, or a bushel and a half, of the compost will contain a pound and a half of nitrogen, that is, one pound to one bushel. A pound of nitrogen in this form is worth at least eighteen cents, and this may be taken as the value of the compost per bushel. It may be used freely for corn, root crops, etc., in the field, and for all garden crops. The composition of dry blood and of dry flesh is almost identical. In the natural state blood contains a little more water—not more than 5 or 6 per cent.

Cows at Calving Time.—"J. J. T." It is particularly important to guard against constipation, and at the same time not reduce the strength of the cow by giving salts, etc. The best plan is, to give the cow for a week or ten days before calving a pint of flaxseed night and morning. It is a laxative, and at the same time highly nutritious. The best way to feed it is to boil it for half an hour or so, and if the cow does not drink it readily add a pint of corn meal. If the bowels become too much relaxed give more corn meal, but do not lessen the quantity of flaxseed. Continue this feed for a week after calving, and as much longer as you wish rich milk and plenty of it. With butter at forty cents per pound it will pay to feed the cows all the corn meal they will eat.

Sugar Beets.—"H. A. H." wishes to know if the sugar beet will flourish in Minnesota. Crops would not be so large as where they have a longer season, but they would probably be remunerative for feeding cattle. Our feedsmen will respond to the name of sugar beet.

Dogs in Tennessee.—A correspondent from this State says: "A fair average is a pup to each child, though I once knew it to fall in a family where they had 17 children and but 8 dogs. Making sheep scarce is not the only evil of familiarity with this animal. The more dogs in a family, the more doggish the people. I go in for a dog law."

"Italian Silver Top-knot" Fowls.—D. Mitchell. We never heard of a breed of fowls of this name. The Silver Spangled and Golden Spangled Poland fowls are excellent layers, non-sitters, and have fine top-knots. The White Leghorns are excellent and persistent layers, and hardy, good fowls. This is an Italian breed. The Black Spanish are a very stylish and elegant breed, requiring warm quarters in winter, and reward care with many large and beautiful eggs. These, too, are non-sitters. A trio, cock and two hens, of any of these breeds costs from \$7 to \$20, according to quality.

Pea-combed Fowls.—"Subscriber," of New London, Ct., does not understand the term "Pea-combed." It is used with reference to Brahma fowls only, so far as we know, and refers to combs which show a triple character, the central comb being the largest, and the other two growing uniformly on each side of it, and each distinct. The points should not run into confusion, as in many rose-combs, and are often quite small.

Manure Scarce in Illinois.—"Gardener," writing from Manito, Ill., says: "I want a substitute for stable manure for my garden * * * Cannot buy manure for love nor money." We would throw no doubt on the veracity of our correspondent, but still we do think money enough will buy a little manure, even in Illinois, within hauling distance of our correspondent, which is, about 4 miles, if a return load, or 2, otherwise. Still it is cheering to know that manure is valued in a State where we formerly had so many subscribers complain that the *Agriculturist* had too much to say on this subject, which was of no importance whatever to them.

Beet Sugar Factories.—"H. K.," St. Louis, Mo. The making of sugar from beets in this country is receiving increased attention, from the partial disorganization of labor and the small crops of cane sugar in Louisiana. It is estimated that one-third of the sugar used in the world is made from this root. In Germany, where the owners of the factories work large plantations to grow the beets, the men are paid to get from 16 to 19 cents a day, and the women from 15 to 17, working 14 hours a day. When the capitalist has to pay six or eight times this price for labor, it changes the problem very much. If it can be made to pay anywhere, it will be in the West, where land is cheap and productive. A large capital is required, and expensive apparatus, buildings, etc. Beets are usually fattened on the waste products, which, in turn, furnish manure for the fields. The establishment of a beet sugar factory is a great undertaking, but, while the price of sugar remains anywhere near present rates, it would seem to offer an attractive investment for capital.

Boiled Grain for Fowls.—"E. C.," Vt. It will pay to boil corn and barley, as experiments show. Loss is gained in boiling other kinds of grain. Potatoes should be boiled and mashed, and fed warm.

Potato Experiment.—"S. N. Beers," of Fairfield, Conn., writes to the *American Agriculturist*: "I planted side by side, of the Early Goodrich variety, 1st, sets or cuttings made entirely from the seed ends of medium-sized potatoes, the cuttings containing about two eyes each, and planted two in a hill; 2nd, two-eye cuttings, made entirely from the stem ends of potatoes; 3d, whole large potatoes. The whole potatoes came up first, and kept about a week ahead of the others through the season. Between the cuttings made from the seed and stem ends, no difference could be perceived either through the season or when they were dug. If the cuttings from the tips had consisted of as large pieces as those made from the butts, it might have been different, but as the eyes were thicker on that end, they could not be made so large. But when the rows that were planted with whole and large seed were dug, it was found that the yield was one-seventh larger by measure, but that the increase was mainly in small and unmarketable potatoes, and that the large ones were not as numerous in appearance as in the other rows. I also tried cuttings from the seed and stem ends of the Harrison, side by side, and saw no difference."

Fish Ponds.—"An old subscriber wishes to know about the construction of fish ponds. No great skill is required in making the embankment. The point of difficulty is the outlet, which should have a gate to drain the pond at pleasure, and a place for overflow, sufficient for the largest freshet. Each side of the gate, for a considerable distance, will need to be fitted with battened plank, to prevent leakage. If the soil is sandy or light gravel it will need to be padded with clay upon the inside of the embankment. If the object is to raise young trout by artificial hatching, several ponds will be needed for the successive broods of fish, and the stream should be fed with copious perpetual springs. If one has natural facilities for raising fish it may be made to pay very well and add variety to the table. Dr. Garlick's work upon fish culture is out of print, and we know of no other good manual upon the subject.

Bees in April. by Wm. W. Cary.—All colonies should be examined early this month, hives should be cleaned of all dead bees and filth, and queenless stocks added to others. Treat very weak and puny swarms in the same way, otherwise they will be very liable to be robbed by stronger colonies. A few pounds of sugar syrup fed now will stimulate breeding and will pay well. Much care must be used in handling bees at this

season to prevent robbing. An ounce of prevention is worth more than a pound of cure. I gave directions last month for feeding unhatched royal jelly as a substitute for pollen; it now remains to say a few words about feeding honey, or sugar syrup, either to stimulate breeding or to prevent starvation. A bee feeder that does not fit in its construction provide for replenishing the feed without exposing the operator to the attacks of the bees, is not a half better than a piece of old comb placed under the cover of the hive, the cells of which can be readily filled by pouring the feed upon it. Some of the patented devices for feeding bees are not nearly so good as this simple way. Many stocks are lost this month for want of sufficient food for a few days, or until they can get fresh supplies from natural sources in sufficient quantity to supply their daily wants, and for developing their brood. To advance breeding, give what the bees will use in feeding their brood. This may be ascertained by examination in the movable comb hive, and made sure of in others by feeding more liberally, say a half pound daily. Increased interest has been awakened on the subject of feeding bees by the publication of the results from practical men, and also by the efforts of patentees to sell their feeders. The advantage depends upon scarcity of early forage, and the condition of the stocks. I advise all to feed a stock or two, note results, date of swarming, and amount of surplus honey, and judge for themselves.

The Ayrshire Herd Book is in course of preparation by Mr. J. N. Bagg of West Springfield, Mass., who is a member of a committee appointed by the Association of Breeders of Thoroughbred Neat Stock, to superintend its issue. Some 700 pedigrees have been passed as approved. After receiving the record of this spring's calves the work will probably be published.

Immigrants as Farm Laborers.—"If a man would be sure of faithful service, he must be a good master, or 'boss,'" as the phrase is with those who think the name servant is derogatory, and that the name master should not be used because the other is implied. Of all servants, or hired farm "help," the immigrant responds most quickly to kind, generous treatment. He should find in America the relation of master and servant is one of mutual dependence—and if he sees that you recognize that fact and treat him as a man and independent citizen, and fairly in all respects, you will be loved and honored by him. The way to get good farm hands is to get a neighbor coming to the city to make the selection for you, if you cannot come yourself. We cannot attend to this business.

New Kinds of Oats., so largely advertised and held at such high rates, are sure to give disappointment if any one buys them with the expectation of getting any such crops as are reported in the circulars and advertisements. We do not very much doubt that the statements may be in the main true, and if any of our readers wishes to be able to tell just as big stories, let him take a few large, plump oats, and sow them in drills, two feet apart, in good garden soil, pull the weeds, topdress with some fine compost or ashes, hoe them or rake the ground over two or three times, and count the kernels at harvest time. Oats respond quickly to good soil and culture, and such as have it are worth two or three times as much for seed as others, no matter how well selected.

Hens for a Large Hennyery.—"Wm. B. Shiner. Calculate to raise your own fowls for next winter and spring's laying, especially if you are going to raise a great many. Select fine old birds and breed carefully. Subjects connected with the profits of, and the best arrangements for, large poultry establishments, have been recently discussed in our pages and probably will be again. We have few records of experience to refer to.

Rapid Growth of Salmon.—"E. C. P." Mass. The statement that a 10-pound salmon gained 11½ pounds in a visit of 37 days to the sea is exceedingly improbable. The Duke of Athol, in March, 1859, caught three salmon on their way to the sea, weighing 10, 11½, and 13½ pounds each; these same fish having been marked by a copper band round their tails, returned in six months, and were again captured, having increased to 17, 18, and 19 pounds each. This is a little over a pound a month, and it will be noticed that the gain is very nearly the same in each instance. This shows gain enough, and, as it is well authenticated, there can be no doubt about the facts. It is ascertained that the size of these fish depends very much upon the extent and richness of their feeding grounds, the largest fish being found in the largest rivers. The fish is exceedingly voracious in its visits to the sea, and in its early years grows very rapidly.

Feeding Scraps, or Scrap Cakes.—"B. F. B.," North Bridgewater, Mass., asks: "Is it safe to feed scraps to swine? Does the process of separating

the fat destroy the Trichinae?" We do not like the feeding of hog to hog. The feeding of beef scraps is not subject to this objection. Both beef and pork scraps have been exposed to a temperature far higher than boiling water, destroying all trichinae and other parasites.

How to Steady a Fan Mill.—"George R. Schamp of Illinois, who hopes to be a reader of the *American Agriculturist* as long as he can read, suggests a very simple way of holding a fan mill firmly upon the barn floor. He simply puts under each of the two rear legs a fourpenny or sixpenny nail. The heads sink into the feet, and also into the floor, and hold the mill steadily.

When Will a Mower Pay?—"C. L. Neal. It will not pay for ten or a dozen acres of meadow, if you have any neighbor, with a machine, whose services you can procure in haying time. If you can cut hay for your neighbors as well as for yourself three or four weeks, it will pay to buy a mower. A good machine will cut an acre an hour, and soon pay for itself if you have work.

Animals Named.—"John N. Clark, Old Saybrook, Ct. The "queer little mole" you sent is one of the shrews, and not a mole. Judging from the specimen sent, it is Foster's shrew (*Sorex Forsteri*) figured in the last volume, page 283, (August No.)—The animal sent from Maine arrived in a state of decomposition, and the letter was lost. It was originally a very fine specimen of the star-nosed mole (*Condylura cristata*), described and figured in the last volume of the *Agriculturist*, p. 53, (January No).

Sulphuric Acid as a Fertilizer.—"The price of Oil of Vitriol was given with the fertilizers, not so much because of its intrinsic value as a manure if applied alone, as of its extensive use in the preparation of superphosphate from bones. It has, however, value used alone, but it is difficult to say exactly what it is, because in economical experiments it is used in the cheapest available forms found in the market, namely as sulphate of lime, (Gypsum,) or sulphate of soda, (Glauber's salt).

Drilling in Corn vs. Planting in Hills.—"J. W." We agree with you that more corn can be raised per acre on rich land from drilling in corn than from planting in hills, and certainly a good deal more fodder. The question is, whether the seed should be drilled continuously in the row, or dropped two, three, or four, together, every twelve, fifteen, or twenty inches apart. The planter we use drops the seeds in the rows every twenty inches. The rows are three feet four inches apart. Continuous drilling, dropping the seeds say six inches apart, might be better. Where fodder is not a special object, or where the land is poor and weedy, we think it better to plant in hills, equally distant each way. It is very convenient to drill in corn, because you can put in the seed as fast as the land is plowed and harrowed; whereas in planting in hills both ways you must finish preparing the whole field before planting a kernel.

Feeding Milch Cows.

There is a large class of dairymen who are engaged in supplying large towns and cities with milk. Not less than thirty millions of gallons are sold by this class in this State alone, and the quantity is very steadily increasing with the growth of our city population. As they have to supply families daily whose wants are nearly uniform, it is an object of great importance to secure in their herds a uniform flow of milk throughout the year. This is done by a regular succession of new milch cows, coming in every month, but this is very expensive, if you have to purchase new cows or to exchange your own extra milkers for what you can find in the market. In the recent Agricultural meeting at Hartford, Conn., the discussions turned quite largely upon this topic. We found that all the milkmen present agreed upon three things, viz.: the importance of a good selection of cows, all to be extra milkers; the cows to calve in regular succession, so far as that matter could be controlled; and extra feeding, especially in the winter. All agreed upon the importance of good shelter, but some preferred a couple of hours of sunshine for their cows in the middle of the day, while others kept them in the barn from fall

to spring. The last could not perceive any ill effects from the confinement. On the contrary, they thought the exposure to the cold required more food and lessened the flow of milk. Nearly all were agreed upon the great value of cutting the long fodder. One thought that in cutting for his herd of thirty cows, the saving paid for his cutter, which cost \$130, twice a year. All were agreed upon the superior value of early cut hay for producing milk. There was much solicitude manifested to learn how to secure a full flow of milk in the months of November and December, during the change from grass to hay. S. M. Wells, of Hartford Co., begins early in the fall with green corn fodder, and follows it with rye sown in August on his richest land. This gives an excellent green fodder until the snow falls. Then he feeds roots and steamed hay. He has water brought into his manger, so that the cows can drink at pleasure, which he has seen them do seventeen times in a day. They are carded regularly and kept in warm, clean, and well-ventilated stables. He feeds, in addition to the above, rowen, roots, and cotton-seed meal, linseed meal, and bran. He feeds very liberally, and reported a very large average yield of milk. In one case, when he wanted to secure a large amount of butter, he fed one of his cows daily with six quarts of cotton-seed meal, four quarts of corn meal, and four quarts of bran, besides other fodder. H. S. Collins commences early with green corn fodder, and follows it up with steamed food. He uses some parsnips and other roots, but thinks they are chiefly valuable for giving cattle an appetite. It may be stated here that Mr. Collins has a very stubborn soil, in which he finds it difficult to grow roots, and this probably influences his opinion. He makes great use of corn stalks cut up by the roots, and thinks them equal in value to good hay, when cut fine and steamed. One gentleman, who had about fifty head of cattle, grew cabbages very largely as a fall feed for his milk cows. These hints ought to be of value to butter makers as well as to the milk producers. With proper care given to extra feeding, it would be easy in most dairies to prolong the butter making season at least a month in the fall, when butter brings a high price.

The Olive and its Culture.

The cultivators in the Southern States seem to have fully made up their minds that it is for their interest to grow a variety of products, and not depend upon one alone. This is wise, and we hope that before many years the capabilities of our Southern States will be more fully tested than they have ever been before, and though there will be some failures in the trial of new products, either from peculiarities of climate or want of experience, the general result of the efforts now being made will be of benefit, not only to a particular region, but to the whole country.

Among the things to which attention has been turned, is the *Olive*, and we have been asked to give an article on its culture. There is but little experience in this country to draw upon. We have seen some of the groves that were planted in California by the early Spanish missionaries, but they can hardly be said to be cultivated, and are only moderately productive. In some of the Southern States the tree was introduced several years ago, but what the present condition of the plantations is we are not informed. In the absence of information from home sources, we translate and condense from Du Breuil an account of the culture, as followed

in the olive districts of the south of Europe. The olive will stand severe freezing when it is quite dormant, but after vegetation has started, it is readily injured by cold. Those localities where late spring frosts occur should be avoided, and in the olive countries an elevated situation is preferred to a low one, on this account.

While the olive will live in almost any soil, and even flourish in a rocky and barren one, yet the crop is greatly affected by the fertility of the soil. Any deep, rich soil, in a situation sheltered from the prevailing cold winds, will answer for starting a plantation.

Propagation may be done in all the various ways, by seeds, cuttings, layers, root cuttings, grafting, etc.; indeed, there are few trees that are multiplied with equal ease. The first question that will be asked by those who wish to experiment in this culture will be, "How can we get a stock to start with?" This is just the point on which we cannot inform them, and it

OLIVE BRANCH.

would be well for those who have trees from which cuttings can be spared, to advertise them for sale, or offer them for free distribution. It would be a good thing for our new Commissioner of Agriculture to import these and other plants not readily obtained. Congress could do much more good to the country at large with an experimental farm in one of the Gulf States, than it can ever do with one at Washington, which is neither North nor South.

Du Breuil enumerates fifteen named varieties cultivated for their oil, and seven, the fruit of which is used for pickling. These varieties differ in the form of the tree, its hardness, adaptation to different soils, productiveness, and in bearing annually or biennially. The fruit also

varies in its shape, color, flavor, and in the quantity and quality of oil it produces. As the fruit presents so many varieties, it is important that those undertaking its cultivation should select those best adapted to the conditions in which they will be placed, and as we cannot give space to the descriptions, we must refer those interested to Du Breuil's *Arboriculture*, 2d vol., page 993, (Edition of 1837).

The seeds are sown for the purpose of procuring stocks upon which to graft the desired varieties. The seed is so oily that it is a long time before the moisture necessary to germination can penetrate it, unless it be soaked in strong lye before planting. Seeds when thus treated come up the same year that they are planted. The seed bed is of well-enriched soil, and the nuts are put in in February, in rows about 2 feet apart. A furrow is made about 2 inches deep, and the seeds are dropped about 2 inches apart, and covered; the after treatment is the same as that of other seedlings.

Cuttings are made of branches from $\frac{1}{2}$ of an inch to an inch in diameter, and 10 inches long; they are set like other cuttings, in rich soil, with three quarters of their length below the surface, about 18 inches apart each way. All the buds are allowed to grow the first year, and the second year the strongest shoot nearest to the ground is chosen—and all the rest removed. This shoot is trained to a stake, to insure an upright growth. The fifth year the young trees are set about 5 feet apart, in nursery rows, and by proper pruning made to form a pyramidal or other desired shape. When twelve or fourteen years old, the trees are set where they are to remain, and planted about 30 feet apart.

A curious protuberance, or knot, forms on the stem of the olive—an aggregation of undeveloped buds. These are removed from the tree by means of a knife, and planted out like cuttings, or rather like bulbs, which they more resemble.

The layering and grafting of the olive present nothing essentially different from the same processes as applied to other trees. Wild seedlings are used for stocks in Europe, and A. J. Downing suggested that our wild olive, or Devil Wood, (*Olea Americana*), which is found in the Southern States, might answer the same purpose.

Pruning, cultivation, and manuring, are practised; it is found in France that good cultivation pays with the olive as with other fruit trees.

The tree bears when twelve or fourteen years old, and continues to produce fruit to a great age. Like other fruits, it is subject to the attacks of diseases and insects. Pruning and accidents produce a kind of rot, which has to be cut away, and the cavity filled with mortar. Insects of various kinds attack not only the tree but the fruit, and often cause the loss of a crop in a short time. Sometimes the trees will stop bearing without any discoverable cause.

The uses of the fruit are well known. It produces a most valuable oil, which in some countries is one of the necessities of life. The pickled fruit is to be considered rather as a condiment than as a food. The fruit is first pickled before it is thoroughly ripe, soaked in lye until it penetrates to the nut, then in water for five days, the water being renewed twice each day; it is then put in a strong brine which has been boiled with spices and allowed to cool.

Whether a product that requires to be so long waited for will ever attain much favor with our impatient people, we very much doubt. Against this tardiness there is to be placed the longevity of the olive, and the great value of its product when obtained. We shall be glad to hear what

success attended the plantations that were made many years ago in Georgia and Mississippi.

Saw Filing.

It is a great art to file a saw well. Few men do it who attempt it, yet almost all who try make the saws run so much better that they are quite satisfied. In saw filing it is an important thing to have the blade firmly held at a convenient light and in a good light. We figure a simple vise for holding the saw. An upright board about four feet long, having a piece of wood, shaped to form one of a pair of vise-jaws, nailed upon the upper end, is fixed against a bench or window sill. Upon this, near the middle, a two-inch strip is fastened, and a shorter board with the mate jaw upon it is nailed upon the strip to match, the nails being in a straight line. The jaws of the vise will be found to have a very little play—enough to receive the saw-blade—and by gently driving a wedge, to spread the boards apart below, the grip or bite of the vise will be found considerable. The art of filing a saw well is only attained by a person having a steady hand and a true eye. Having the saw firmly grasped by the jaws described close to the teeth, first make sure that the points of the teeth are on a true line. If any extend above the line, file them squarely down to it. It is better that a tooth should not touch at all than that it should have all the work to do, and nearly all the work comes on teeth which project beyond the line, if any do so. The file used must be in proportion to the size of the teeth, in order to go in deeply between them and leave a sharp, clean angle. File so as to retain the bevel of the points and the shape of the teeth unaltered, unless you choose to take the responsibility of making a complete change in the saw. The guide to a correct bevel is the glance of light from the window, which should be the same from each tooth, both before and after it is filed. The whole length of two teeth must be touched by the file at each motion. The teeth of each "set" are filed separately, but more minute directions would only confuse one who has not practiced saw-filing. There is no mystery whatever about it.

SAW-HOLDING VISE.

Bark-Lice—Scale Insects.

Quite a quantity of communications have accumulated upon "the Bark-lice," the writers using the same term when speaking of very different insects. The most common Bark-lice,

THE BARK-LOUSE.

as well as the most destructive, is the *Aspidiotus conchiformis*, which from its shell-like shape is by some called the Oyster-shell Bark-lice. The appearance of the insect in winter and early spring is shown in the engraving. One corre-

spondent thinks he has discovered the whole story of the Bark-lice, and sends us a long communication describing the manner in which the insect throws off her eggs, which fall to the ground, where they remain until spring, when they are hatched and the young insects ascend the tree. The scale he regards as only the dead body of the mother, left after "throwing off her eggs." Had the writer carefully lifted one of these scales he would have seen the difference between guessing and observation, for he would have found under each quite a number of little white eggs. These are not thrown off at all, but remain under the scale and are hatched there. The history of this insect is briefly this. The young lice are hatched in June, travel to the twigs, where they fix themselves by the proboscis, and subsist like other plant-lice by sucking the juices. After they have undergone their changes, the perfect male being winged and the female wingless, the female increases much in size and finally dies, leaving her eggs enclosed in the remains of her body, which form a protecting scale, of the color of the bark. The scale itself is not injurious; it is a record of past injury and a warning of trouble to come. This Bark-lice is believed to be imported, and is death to the trees if neglected. Another Bark-lice shows itself in the scale state as milk-white spots; underneath this are the eggs which are of a red color. Mr. Walsh considers this an American species, and has named it *Coccus(?) Harrisii*—Harris' Bark-lice; it is less common than the other. The practical point is the destruction of these insects. Mr. B. D. Walsh, in the Practical Entomologist (a journal we much miss), states that the scale is so impervious to solutions of soda and potash that they do but little good unless applied soon after the insect is hatched. He tried kerosene, but that killed a share of the limbs as well as the insects. Mr. C. V. Riley, in the Prairie Farmer, suggests the use of Carbolic acid. This acid, or its equivalent, is used in the "Cresylic Soap," and as this has been found efficient in destroying other insects, we hope to hear that it has been useful with the Bark-lice. The natural enemies are the Lady-birds and birds. Watchfulness is another help—never plant a young tree with scale upon its bark. No nurseryman who cares for his reputation will send out trees thus affected. We shall be glad to hear of any successful attempt to stay this pest, which threatens to destroy young orchards.

Weeds—Rib-grass. (*Plantago lanceolata*.)

One of the common weeds of cultivated grounds, especially in the older settled portions of the country, is the Rib-grass, which is also known by the names of Ripple-grass and English Plantain. The much reduced engraving will recall it to those who do not know it by name. It belongs to the same genus as the common Plantain, so frequently found about door-yards, although the flower spikes of the two are so unlike that the relationship is not striking to any but a careful observer. Under favorable circumstances this species grows two feet high, and its perennial root forms a large stool. The Rib-grass cannot be classed among the worst weeds, as it is eaten by animals, and is not particularly aggressive. The chief harm it does is to occupy the soil to the exclusion of other plants. It has been recommended as a forage plant, but is so inferior in quality and productiveness that it is at present not esteemed. In clover fields it is often the most abundant weed, being generally sown with the seed. The seed of the clover and the Rib-grass are so near-

ly alike in size that their separation is difficult, and as they resemble one another in color, the presence of the weed seed is not noticed in ordinary inspection. A magnifier of moderate power shows the difference at once; the seed of the clover is in shape somewhat like a miniature bean and alike on both sides, while that of the Rib-grass is convex on one side and concave on the other. Prof. Buckman, of England, who some years ago made a careful examination of

TRIB-GRASS—(*Plantago lanceolata*.)

the seeds in the London markets, found Red Clover seed to contain from one million to two and a half millions of Rib-grass seeds to the bushel, quite enough, should the seed start before that of the clover, to stock the land. An examination of samples of seed from our best dealers showed them to be remarkably free from seed of Rib-grass, as well as other weeds.

THE WHITE FRENCH TURNIP.—The people of the State of Rhode Island and Providence Plantation have long had a most excellent variety of turnip, known as the White French. Tradition says that it came in with the French fleet in the Revolution. However that may be, it was mainly a Rhode Island institution until, some years ago, we distributed it far and wide among our seed premiums, and we have learned from numerous sources of the satisfaction it gave. It is a white winter turnip, and raised the same as rutabagas, to which it is vastly superior. To our taste it is the best of all turnips. That it holds its own in Rhode Island is shown by some excellent specimens from the farm of Col. Geo. E. Waring, at Newport, and that it is upon the lists of the principal seedsmen. Its only fault is that it grows less smooth than some others, and is not so taking to the eye.

Channel Island Cattle.

JERSEYS AND GUERNSEYS.

In an article on the Channel Island cattle in the January number, page 53, there was a brief account of these Islands, their location, products, etc., and of the rich milk of the cows, which gives the islands an enviable fame for fine butter, and creates the great demand for cows for exportation. The Jersey (incorrectly called Alderney) and the Guernsey are as distinct breeds as the Short-horn and the Ayrshire.

THE JERSEY COW.—Dr. Twaddell, of Philadelphia, in his account before the Philadelphia Agricultural Society, says of the Jersey cows: "They are of all shades of color from a pale yellow fawn, running through all the intermediate hues, even occasionally to a red. There is often an intermixture of black and gray known as French gray, and that merging into black with an amber colored band along the back, the muzzle being invariably shaded with a lighter color. Individuals are often seen black and white or pure black unrelieved by any other color. A yellow brindle, is sometimes seen, but this is by no means a favorite."

The Jersey cow, if good for anything, shows usually bad points to a Short-horn breeder's eye; but if the *hand* of a beef feeder or Short-horn breeder were laid upon the soft, velvety, unctuous, elastic hide, yielding with plasticity to his gentle grasp, he would not hesitate to assert his belief in the ability of the cow to take on flesh, if dry and well fed, and so indeed she would, very rapidly. The skin of the cow figured is very fine; added to all that is called good "handling," its beautiful orange color gleams out through the black hairs, and is especially obvious in the ears, about the eyes, on the udder and teats, and at the base of the tail. When photographed the cow was in full milk, and, of course, low in flesh, as she had no feed but good pasturage. She was, however, in exactly the best condition to show her fine points, as well as her defects,—the small head, large bright eye, thin neck, slender, deer-like legs, large body, full milk-veins, etc. She is owned by Mr. James P. Swain, of Bronxville, Westchester Co., and is twelve years old. Her black color is universal, except a slight russet or amber band down the back, and one of a similar color surrounding the muzzle, and also a light spot or two upon the udder.

We present the engraving as an extreme case, representing well the peculiarities of one favorite class of Jerseys, namely, those having no white marks and being of prevailing very dark colors, with black mouths and tongues.

THE GUERNSEY COW, says the Doctor whom we quote above, "is a larger animal (than the Jersey) coarser in the head, heavier in bone,

regard to the Guernsey that the drawing represents the cow most faithfully, and is, perhaps, the best cow portrait we have ever seen. Her color is yellowish dun, or coffee-and-milk color, shading into French gray, darkest at the edges of the spots bordering upon white. She has an extraordinary depth of body, and her horns are less coarse than is characteristic of the breed.

Mr. Swain writes:

"You ask me for facts in regard to the Guernsey cow 'Cottie' and the Jersey cow 'Ebony.' I will tell you the story of Channel cattle as far as they have come under my own observation.—In the summer of 1845 I employed Wm. Leroy, an intelligent Guernsey man, to build a factory for me, and he interested me in the cattle of his own and the other islands so much that I imported one from the little island of Alderney, two from Guernsey, one from Sark, and two from Jersey. I found but one of them to be a superior cow in every respect. She

came from Guernsey; gave 32 pounds of milk a day when in full milk, averaging 24 pounds a day for eight months; was never dry during the six years I owned her. She was accidentally killed, 'Cottie,' now the property of Geo. P. Nelson, Esq., of Scarsdale, is her first calf. She is now 14 years old, has a calf one month old, and I think will do well for 5 or 6 years to come. She has been in milk over twelve years, except two or three months. She averaged during the summer 24 pounds of milk for eight months, and about 8 pounds for the balance of the year. Of the quality of her milk I cannot give you facts, but can in regard to that of her sister. She was so much like her that we could never tell which was the best for quantity or quality. This sister, 'Katie,' now owned by James Hall, Esq., of East Chester, gave at her height 43 pounds of milk per day and made 14 pounds 5 ounces of butter per week, and averaged 24½ pounds of milk for eight months, and a little less than 8 pounds for the balance of the year. In all the descendants of 'Cottie' and

where they are kept they are held in high esteem. Their lack of the high-bred look and style of the popular breed, and the fact that there are so few of them that they have been bred with the Jerseys, accounts for the general ignorance which prevails in regard to the breed.

We give herewith a letter from Mr. Swain in regard to both these cows, only adding here in

'Katie,' and they are very many, I do not think there is a variation of one per cent in the quantity and quality of milk they give with the same care. This family are all that have been of especial value out of seven imported cows. "I have watched with interest nearly all the principal importations both of Guernseys and Jerseys, and I do not think that there has been

JERSEY COW "EBONY," 12 YEARS OLD.

GUERNSEY COW "COTTIE," 14 YEARS OLD.

more than one in seven, if so many, that were really superior. For the past five years I have selected from other importations such as suited my fancy, and the old black cow "Ebony," imported by Thaddeus Davids, is one. She, with "Lop-Horn" from the importations of the late Thos. Richardson, and a bull, "Dashau," imported by H. W. Cameron, are the source of my young stock. They improve in beauty, strength of fancy-marks, and color, but not in quality."

Walks and Talks on the Farm.—No. 52.

Mr. Orange Judd, of the *American Agriculturist*, has placed in the hands of the New York State Agricultural Society the sum of Three Hundred Dollars to be awarded as special prizes, of \$100 each, for the best two barrels of White Winter Wheat, the best two barrels of Red Winter Wheat, and the best two barrels of Spring Wheat, exhibited at the next fair. I hope we shall get samples from every wheat-growing State in the Union, and also from Canada. We have never yet had a decent show of wheat in the country. Our pomological friends are far ahead of us in this matter. We have much valuable information in regard to the best varieties of fruits adapted to different sections, and at the meetings of the American Pomological Society have an opportunity of examining fruits raised in different States. But what do we know about wheat and other grains? We hear of the splendid wheat grown in Oregon and California. Some few of us may have been favored with a sample sent in a letter by a friend. But let us have a barrel or two accompanied by a bunch of the ears and straw, and at the same time let us have specimens from Nova Scotia, New Brunswick, and Maine, to compare with samples from Minnesota and Kansas. Let Southern Illinois and Western New York show us what effect climate has on the quality of wheat; Michigan, Ohio, Kentucky, Indiana, Wisconsin, and Iowa, should also contribute. Pennsylvania, too, raises good wheat, and Delaware, Maryland, Virginia, and North Carolina, ought to be able to show us superb samples. And then, what a chance such an exhibition will afford us to get a change of seed, and of the choicest kinds! We could get a bushel from Canada, and a bushel from Southern Illinois, or from Virginia, and thus, if of the same variety, ascertain whether wheat brought from the North will ripen earlier or later than seed brought from the South—a question on which authorities hold different opinions. For one, I feel grateful to Mr. Judd for calling attention, by his liberal offer, to the importance of exhibiting and comparing our best wheats from different sections of the country. The prizes are worth competing for, but aside from that, wheat growers should do all they can to make a good display for the sake of eliciting useful information, and enabling us all to get a change of seed. I understand the intention is to give all the exhibitors an opportunity of selling their wheat at auction on the fair grounds without charge.

The dairymen of Herkimer County are in a sad condition. Two or three years ago, they complained that the State Agricultural Society was wholly in the interest of the wheat growers, and did nothing for them. The Society has done something for us. It offered nearly as large a Premium for the Best Barrel of Wheat as for the Second Best Linen Diaper. But when it seemed that the midge would cause the entire abandonment of wheat growing in Western

New York, we got no help from the State. We fought it alone, and conquered. The dairymen have suffered greatly from a disease among their cows, and I, for one, am very glad that the State, through the influence of the Society, has authorized some of the ablest scientific men in the country to investigate the matter at the public expense. But the dairymen should not complain of being neglected. They have now another trouble. We had supposed that, as they have received double and treble prices for their cheese, and as it takes less labor to produce a dollar's worth of cheese than a dollar's worth of wheat, or of potatoes, or corn, they were making money. At a recent meeting of the Little Falls, (Herkimer Co.) Farmers' Club, this subject was discussed, and every one of the speakers presented statements of receipts and expenditures of dairy farms, showing an actual loss with cheese at 14 cents per pound. Before the war, with cheese at 7 cents per pound, they made money, so at least they now say; but at the present time, owing to high wages and taxes, there is no profit in making cheese at 14 cents. Here is one of the reported statements:

"Hon. Josiah Shull, of Mohawk, has a farm of 81½ acres, which cost \$130 per acre. He keeps 20 cows. His estimate is as follows, making no account for the farm:

RECEIPTS.	
Twenty cows yielding 8,337 pounds of cheese, whole sold for \$14.25 per hundred.....	\$1,186.33
Increase on crotter (critter?) for beef.....	40.00
Calves.....	45.00
Total receipts.....	\$1,271.33
EXPENSES.	
Boy six months and board.....	\$10.00
Man, including board.....	300.00
Fertilizers—plaster, &c.....	15.00
Taxes.....	75.00
Horse-shoeing and other repairs of farm implements.....	50.00
Wear and tear of implements.....	65.00
Average repairs of fences and buildings.....	175.00
Average depreciation and interest on stock.....	180.00
Insurance.....	5.00
Incidentals.....	50.00
Carting milk and manufacturing cheese.....	215.00
Total expenses.....	\$1,395.00
Loss.....	\$123.67

In this estimate, it will be remarked that nothing is charged for farm, for female labor, or for superintendence and work by Mr. Shull and family. All the grain raised upon the farm is consumed by them and stock. It will be seen that the cheese costs more than \$14.25 per hundred. The statement was considered by the Club a very fair estimate."

If this is a "very fair estimate," Mr. Shull either paid too much for his land, or he does not farm it to the best advantage. Perhaps, however, the house and buildings are expensive ones. He paid \$10,595 for the farm. If the house is worth \$10,000, the land cost him \$595. This is more than it is worth, according to the above statement. An amateur drover took a lot of cattle to New York, and lost money by the operation. "But then," said he, in relating his experience to a friend, "I had the pleasure of their company down." Mr. S. has the pleasure of looking at his 20 cows and the "beef critter" at a yearly expense of \$94.33. The cost is far less than a box at the opera. But, seriously, taking the statement as it appears, there is something radically wrong. The difficulty does not lie wholly in the increase of wages and taxes. The Club admits that formerly they made money with cheese at 7 cents per pound. At this figure, the receipts would stand thus:

20 cows, yielding 8,337 pounds of cheese, @ 7 cts., \$583.59

Increase on animals for beef..... 40.00

Calves..... 45.00

Total receipts..... \$668.59

If labor and taxes formerly cost nothing, the receipts would not afford a princely income; they would not pay interest on cost of the farm.

Probably the real explanation of the matter is this. The land cost but little, and the farmer and his family did pretty much all the work; they lived economically, had no rent to pay, and supplied the table from the farm, and consequently were able to lay up money even with receipts less than \$700 per annum. They can do so now by adopting the same system. The receipts are double, and the expenses are not more than double, and consequently the profits must be double what they were formerly.—The labor items are as follows:

Boy, six months and board.....	\$10.00
Man, including board.....	300.00
Carting milk and manufacturing cheese.....	215.00
Total.....	\$555.00

The following line, which is taken from the statement, is interesting by way of contrast:

Fertilizers, plaster, &c..... \$18.00

Seven hundred and fifty-five dollars for extra labor, and eighteen dollars for extra manure! Reverse the figures for a few years, and cheese-making at 14 cents a pound will pay. And by that time, Patrick and Dutch John, as well as Bridget, will be willing to share profits with the farmer, instead of demanding the whole. Instead of keeping 20 cows on a ten thousand dollar farm, and raising nothing besides, it could soon be made to keep fifty; and instead of the "depreciation and interest on stock" being a charge to the farm of \$9.00 a head, it would improve \$9.00 a head. And instead of getting 400 pounds of cheese from a cow, 500 pounds would be obtained. The receipts would then stand:

50 cows, 500 pounds of cheese each, @ 14 cts.....	\$2,500
Increase in value of stock, beef sold, &c.....	200
Calves.....	45
Total.....	\$2,745

With such receipts, a farmer can afford to pay a liberal sum for hired help. Our only chance of being able to pay high wages and high taxes is by high farming. Low farming necessitates doing your own work, having low-priced land, and adopting an economical style of living. The fact that all the statements made at the meeting showed that there was no profit in cheese-making, looks a little as though the object was to discourage others from engaging in the business. I am inclined to think the profits have been overestimated, and it will be well for outsiders to wait a while before investing largely in cows and cheese factory shares.

An old friend of mine, now a Methodist minister in Canada, writes: "I once in a while get a chance of a Walk and Talk with you through the *Agriculturist*, and am glad to find you still battling for the right in Agriculture. If you do succeed in getting farmers to farm just right, what will you do with all the crops? It is slow work to convince farmers that they ought to bury their talents in the earth in the shape of underdrains, but I believe what is wrong in theology is right in farming. I was trying to convince a friend of mine that it would pay him to borrow money at 8 per cent, to invest in underdraining his farm. Two years since, the fall was so wet he could not put in his winter wheat, or do any fall plowing. In the spring, the land was still very wet, and not having any of the land plowed, the crops could not be got in till very late. Then came the drouth, and the crops were not worth harvesting. He did not make enough from a farm of 125 acres to pay his single hired hand. One would think such facts would convince him of the advantage of draining, but I have no idea of his doing it. Yet he says his dish is always upside down when it rains porridge." All the poor man wants

is faith—faith that leads to good works. He has too much hope. He hopes for better luck next year—hopes for good crops without using the means. I am not so sure, however, that he had better borrow a thousand dollars at 8 per cent. It is a high rate of interest, and if he has had no experience, he might not expend it with judgment and economy. Let him do a little this spring, and do it well as far as he goes. The result will convince him of the advantages of draining, and next spring he will do more, and he will not stop till the whole farm is drained.

If everybody should farm right, and raise large crops, we should hardly find a market for them. But there is no danger. Our productions do not keep pace with our population. Farming is not popular. And those who stick to the land, and bend all their energies to increase its productiveness, have every prospect of abundant success. Good farming will pay.

"Does it pay me?" I did not say I was a good farmer. I mean to be. I do not preach one thing, and practice another—any more than I can help! But supposing I did not make it pay, what would it prove? One of the newspapers recently said that I "had succeeded in applying science to Agriculture in a common-sense way, and in making it pay." I have never said so, publicly or privately. The man who wrote the above sentence does not know much about farming, or he would not have been so willing to assume as true what he could have no means of knowing, and what is so improbable in itself. It would require pretty conclusive evidence to make me believe that any purely scientific man had made farming pay. Watts would never himself have succeeded in manufacturing steam engines with profit. It was his partner's business talents that gave him his fortune. One of the very ablest agricultural chemists of the age once told me that he did not believe he himself could make farming pay. He was at the time, and had been for years, engaged in making experiments in agriculture. Had he known less of farming, he would not have been so modest.

Whenever a man talks flippantly of the great pleasure and profit of farming, of its comfort and independence, of its freedom from care and anxiety, of the great respect he has for the "honest, hard-fisted tillers of the soil," set him down as a flatterer or a fool. This matter ought to be understood, more especially as the subject of agricultural education is now attracting much attention. It will not be long before every State has its Agricultural College. We ought not to ask or expect too much from them, or we shall be disappointed. The farms connected with them cannot and will not pay.

Some time ago, I was reported as saying that we wanted young men of capital, intelligence, and enterprise, who should engage in farming with a determination to make it pay. If I said so, I spoke thoughtlessly, for it is not my idea at all. We want intelligent, educated men who love farming, and who are determined to adopt it as the business of their lives, and who shall follow it with all the skill and science and energy they can command. A manufacturer who should engage in making woolen goods with a determination to make it pay, would probably soon furnish nothing but shoddy. A grocer whose only object was profit would be tempted to give us more peas than coffee. And the young man who engages in farming, determined to make it pay, will probably skin his land, or advertise "Japan Spring Wheat that will yield 60 bushels per acre," or go into the chicken business, or sell grades for thorough-

breeds. Ordinary farming is too slow a business for such a man. He would soon be driving round with every patent-right man who visited the neighborhood, and would wind up as a second class politician or a horse jockey.

All the eminent farmers I have ever known or read of have been men who were willing to wait. Jonas Webb began farming in 1822, when he was 26 years old. He immediately commenced improving his flock of sheep by selecting and purchasing the best he could find; but it was not until 1840 that he took his first prize at the Royal Fair. For eighteen years he worked quietly and patiently, but energetically and hopefully. Had he been "determined to make farming pay," we should never have heard of Jonas Webb. He aimed at improving his farm and improving his stock, and in the end honors and wealth flowed in upon him freely.

I am inclined to think the root of all roots for this climate is the Parsnip. It can be sown earlier than any other, and is thus in full possession of the soil before the usual period of drowth, and suffers but little. The crop requires far less labor in weeding than the carrot. Sow in rows two feet apart, and use the cultivator between the rows. If the land is ridged, and the seed drilled in on the ridges, it will greatly lessen the labor of hoeing and weeding. And indeed this is true of all root crops. But the trouble is that our machines for drilling in the seed are ill adapted for the operation. We need a good double-mould board plow for making the ridges, and a drill that will sow two rows at a time, with a roller in front to press down the ridges, and a lighter one behind to cover the seed. The horse walks between the ridges, and the operation of sowing is mere child's play. This is the way turnips are raised in England. As soon as the plants are up, a light cultivator is run between the rows, and as the plants are on ridges there is no danger of smothering them. Parsnips are twice as nutritious as rutabagas, and three times as nutritious as ordinary turnips; and the importance of this fact will be appreciated when we consider how much labor it is to handle a heavy crop of roots. I have known a crop of late sown white turnips to contain only 6 per cent. of dry matter; and our popular varieties of rutabagas, such as Skirving's Improved Purple-top, contain only 10 per cent; Mangold wurzel contain from 12 to 14 per cent; Carrots, from 12 to 15 per cent; Parsnips, 18 per cent. And the dry matter of the parsnip is said to be more nutritious than any other root. So that if parsnips are preserved in the cellar like other roots, half as much space as is required by other roots will hold an equal amount of nutriment. But this is not all. Parsnips can be left in the ground all winter without injury; or, if dug in the fall, can be thrown into a pit, and covered with a little straw, and they will keep perfectly well. So, at least, an experienced grower assures me. For these reasons I believe the Parsnip will prove to be the great root crop of American farmers. The seed is easily raised, and farmers should grow their own, or be careful from whom they purchase, as old seed will seldom grow. Two pounds is sufficient for an acre, but it is best to sow three or four pounds unless you are sure that it is good. It is not expensive, the growers in this section seldom getting more than 40 cents per pound for it.

"Why have you such a special spite against hen manure?" asks a friend. Simply because people make so much fuss about it. There is even now a statement going the rounds of the

papers to the effect that 100 pounds of hen manure is worth more than a ton of horse dung, and twice as much as guano. Now, if you feed hens on meat, you will doubtless get rich manure. But farmers' fowls, as usually managed, are fed very little flesh meat. In the winter, they are able to pick up but little animal matter in any form, and it is at this period that we get the most droppings. From what I know of the way in which most fowls are fed in the country, I would rather have a ton of good Peruvian guano than five tons of hen manure, even after it had been pounded and sifted, and worked over in the most orthodox manner. "What would I do with it?" Use it as we do other manures. Throw it into the manure cellar, or put into the manure pile, or compost it with muck, leaves, etc., for the garden.

The Cultivation of Barley.

Barley is excellent food for horses and for pigs. The Arabs seldom feed their horses any other grain, and barley meal is the favorite English food for fattening hogs. In this country it cannot compete with the oat crop for the former purpose, nor with the corn crop for the latter. When it brings a low price, however, it is well to recollect that it is a capital food for almost all kinds of stock, and can be fed out on the farm with advantage. As a general rule, however, it commands a higher price from the maltsters than it is worth for food. The price, however, is subject to greater fluctuations than that of almost any other crop we raise. There is no export demand for it, except at low rates, and a large crop knocks down prices to a point below the cost of production. There is no outlet for the surplus. This is owing to the fact that the quality of our barley does not come up to the standard of foreign maltsters. They will not buy it at any price, and when exported it is used for food or for distilling purposes. At present prices, however, it is a highly profitable crop to raise on land that gives a good yield.

Spring barley requires richer and better prepared land than winter wheat. It is useless to hope for a good paying crop on land that needs draining, or that is poor, or that is full of weeds. It must have good culture. Oats do well on soil land; barley, seldom or never. It generally follows corn or potatoes. It should be sown early in the spring, and there is consequently no chance to manure it. The manure must be used on the previous crops. Artificial manures, such as equal parts of guano and superphosphate, would probably pay as well on barley as on any other farm crop. Sow them broadcast, at the rate of 300 pounds per acre, and harrow in before drilling the seed. At the present price of barley, their application on well-prepared land would be highly profitable. As barley is generally followed by winter wheat, special efforts should be made either to have the land highly enriched for the previous crop of corn or potatoes, or some such manures as the above must be used, or the wheat must receive a dressing of well-rotted manure.

If your land is not dry, mellow, clean, and in good heart, do not sow it to barley. It is a waste of seed and time to sow it on wet, cold, lumpy, weedy, poor land. It costs more to harvest a poor crop of barley on cloddy land than it is worth. Oats will do better than barley, but the best thing to be done under such circumstances is to summer fallow, or to plant the land again to corn or beans, and cultivate thoroughly. There were hundreds of acres of

barley last year that could not be cut with the reaper, because it was so short that the machine could not be put down low enough to reach it!

On light, warm, sandy soil, that is not liable to bake, barley should be sown as early as the land can be got into a fit condition. When sown early, such land, if *very rich*, will produce splendid barley. On heavy, clayey loams it is thought best not to be in any hurry about sowing before the first week in May, unless the land happens to be in splendid order. We are inclined to think that, provided the soil is dry and rich, the earlier barley can be sown the better. Two bushels of seed per acre is considered sufficient, but we prefer $2\frac{1}{2}$ bushels, broadcast, and $2\frac{1}{2}$ bushels, if sown with a drill.

It is usual to roll the land when the barley is fairly out of the ground. The rolling, of course, can be done at the time of sowing, but it is frequently quite a convenience to be able to postpone the operation for ten days or two weeks. The land is drier, we have more leisure, and the work can be all done at once.

In harvesting, the crop is cut with a reaper, and it is better to bind it into sheaves. But it often happens that other work is so pressing that it is left loose in the bunches as thrown off from the machine. The bunches should be turned in the course of a few hours, and great care should be taken to prevent the crop from being stained by the weather. A bright sample will command from 5 cents to 15 cents per bushel more than one stained by the weather, or discolored by heating too much in the mow or stack. If it should so happen that the crop heats in the mow, do not thrash it till it has done "sweating," and it will not be injured.

A Simple and Good Corn Crib.

Mr. Francis Collins, of Bucks Co., Pa., sends the *American Agriculturist* a very accurate description of his corn crib, with his reasons for building it as he did. If not taken as a model, nevertheless, the description may be very useful as a guide to farmers in constructing similar buildings of varying capacity. Mr. C. writes:

"I have never known any corn crib that combined so many good points. It is of good size and durability, very easily filled and emptied, perfectly rat-proof, and we have never known

posts, 7 on a side. These posts are of excellent red cedar and locust, about 7 inches in diameter, set in the ground $2\frac{1}{2}$ feet, and resting on flat stones. They should reach at least 20 inches above the ground, which is high enough to prevent rats from jumping up, and getting into the crib. The tops of the posts should have old tin milk-pans inverted over them, (as shown in the engraving,) for mice climb a vertical piece of tin. The sills are fastened to the corner posts by thick and long wooden pins, to prevent the crib being blown over. The best position for a crib is north and south, so that the westerly winds may have a good chance at it, and it must stand clear from all other buildings. The cross-sills, or joists, are let into the sills every 3 feet, and are of oak, 5 by 6 inches. The end posts, middle posts, and two other posts which are equidistant from the end and middle

posts, are 5 by 5 inches, and should be of a durable and hard wood; mine are of heart-pine. The other posts are of hemlock, 3 by 5 inches, and 2 feet from centre to centre. The corner and middle posts are braced. There are five cross-ties, (two of these are at the ends,) which are tenoned, and *keyed* to the larger posts, just below the plates. The plates are 4 by 7 inches, put on flat-wise for greater strength. The roof should be of white pine shingles, with three sliding doors. When the crib is nearly filled, the sliding doors are pushed up as far as needed for shovelling in the corn, and are held in their places by the shingles, which overlap the edges of the door about $1\frac{1}{2}$ inches. When they are pulled down, there is a batten on the inside of the door which just allows the bottom of it to come in line with the eaves.

The sides of the crib are covered with oak-lath, 2 inches wide, and with spaces between sufficiently narrow to keep in the thinnest ears, a board to face the sills, and another narrow one to run 4 inches up the side. The ends of the crib are covered with boards, and have a

large door in each. After the laths are nailed on the sides, small doors or windows, about 20 inches square, are sawed out of the laths, and the sawed pieces are fastened with wrought nails to cross-pieces; so that when the door is put in, the tops of the cross-pieces go inside of the first lat above the opening, then the door drops down an inch or two, and the bottoms of the cross-pieces go inside of the first lat below the opening.

Thus we have a cheap, easily made door, easily taken out, and, when in, hardly to be distinguished from the adjoining parts. I have eight of these doors, four of them close under the eaves, and four a little lower, for easy shovelling.

When filling, nail loosely pieces of board inside of the door-posts, at the end of the crib, so that the corn cannot press against the door.

When emptying the crib, use the side-doors as soon as it is possible to shovel the corn through them into a wagon. The crib will hold about 900 bushels of shelled corn when it is well filled.

Plowing for Corn and Potatoes.

There is little doubt that potatoes, as a rule, do best now a days on fall-plowed sward. The decaying sod affords organic manure enough on most soils, though if the land is dry, sandy, or gravelly, and this crop is not especially subject to rot upon it, a moderate dressing of barn-yard

THE MICHIGAN FLOW.

manure, or a good muck compost applied early in the spring, is often very useful. If, however, the sward is a close one, we would apply, say, 50 bushels of lime to the acre in the spring, half before and half after plowing. Wire-worms are often a great annoyance on an old sward, and when their presence is suspected, we advise the use of lime slaked with brine, not as an absolute prevention of danger from worms, but as an important check, being death to many of them.

Potatoes are often planted on spring-plowed sod with good success, and on light soils corn does best so treated. When this is done, there is seldom opportunity to cross-plow and knock the sods to pieces. If it is attempted, the crop is put in very late, in order to give the sods a chance to rot before cross-plowing, and the weeds and grass will probably prove masters of the situation. If the soil is thin, use a flat furrow plow, and invert the sod as perfectly as possible. If there is a sufficient depth of soil to warrant plowing eight inches deep, by far the best plow to use is the Double Michigan, or "sod and subsoil" plow, which is simply a large plow with a small plow, called a skimmer, placed on the beam in place of a coulter. The operation of this plow was shown by an engraving in the *American Agriculturist* for May, 1865.

The little plow folds half the sod slice upon the other half, and the big plow turns it into the furrow and covers it with mellow loam. The engraving gives a good idea of one of these plows. They are made of all the favorite forms, and any clever smith can adapt a "skimmer" to a common plow. The share of the little plow should always cut as wide as the plow can turn, and the wing of the mould-board should extend out wide enough to lay the half-slice of sod flat over upon the uncut portion. When manure is plowed under with the plow, it is of advantage to have boys follow behind the plow and haul the manure from the next slice into the bottom of the furrow. This leaves the manure in part upon the sod and in part upon the bottom of the furrow. When manure is turned under in plowing, lime should be applied, if at all, upon the plowed surface. The Michigan plow usually leaves the ground fit for planting.

THE PRICE OF HORSES.—The difficulties attending efforts to report the horse market of

CORN CRIB.

it to fail to keep corn perfectly. It has been built nearly twenty-five years, has had little or no repairs put upon it, and looks like standing twenty-five years more without needing any. It is 40 feet long, 5 feet wide at the sills, and 7 feet wide at the plates, with posts 7 feet 10 inches, from top of sill to top of plate. The sills are of white oak, 6 by 7 inches, set upon 14

New York are such as to lead those who attempt it to specify only in the most general terms the condition of the market, that is, the supply and demand, as nearly as it can be estimated, and besides, notable transactions that can be reliably ascertained. Each horse, or pair of horses, is generally sold by a special bargain—the dealer getting all he can, and the buyer paying the least possible; each exercising his wits to secure his own interest, without reference to market price or to anything except his own necessities. The street car and omnibus companies usually limit those who purchase for them to a price which they must not exceed; hence for the class of horses which they require there is a sort of standard of prices, which fluctuates but little. However, these horses are quietly picked up in different parts of the country; but while comparatively few are bought in the city, a good many, which are found to be unserviceable, are sold here. In this way the city has its full share of halt, broken-winded, and vicious beasts.

Watering and Feeding Troughs for Sheep or Hogs.

Sheep and hogs will put their feet into the troughs if they can. They will even stand and lie in them and defile them in every possible way. This may be prevented by various means, but we think no one has suggested a simpler remedy than Mr. Jacob Nixon, of Van Buren Co., Iowa, who sends us a sketch and description of an appliance he has put upon his troughs, which is seen in the accompanying engraving. Neither hog nor sheep can feed from such a trough with both fore feet in at once, and it would be difficult for any but a very young animal to stand or lie in the trough. The improvement consists of a board set up edgewise, lengthwise over the middle of the trough, kept in place by standards at the ends, and a brace,

WATERING AND FEEDING TROUGH.

if necessary, in the middle. The trough, *H*, is represented as 10 inches high and 20 inches wide; the standards, *I*, *I*, are inch boards, 4 inches wide, and the board, *J*, over the trough is of inch stuff 8 inches wide. If the trough is more than 10 feet long, a brace, *K*, is needed; otherwise not. This contrivance is equally applicable to log (dug out) or plank troughs.

USE OF STRAW FOR FODDER.—Dr. C. A. Cameron of Ireland recommends the use of straw for fodder. Oat straw contains from 3 to 4 per cent. of flesh-forming principles and about 12 per cent. of gum, sugar, and other fat-forming matters. Wheat and barley straw are not quite so valuable. He recommends that the straw should be either cooked or fermented before being used, as in either case the constituents are far more digestible than when the straw is merely cut or reduced to chaff. When hay is

scarce the straw chaffed may be substituted for it, increasing the quantity of meal or roots in the fodder. Straw should not be fed alone.

Turkeys—Success in Raising.

Comparatively few people have uniformly good luck in raising turkeys. Those whose flock numbers perhaps hundreds one season will count but a bare score or two another. When the old birds are watched, shut up, and made to sit where they can be controlled, and the young receive great care from the first, they seem to do no better and often not so well as when the old turkey steals her nest in the woods and brings her young home only when she finds it hard to provide food for them. Young turkeys seem to die for no good reason. Some of the readers of the *Agriculturist* report their dying at the rate of 20 or 30 a day. The gapes destroys many, and a slight cold, apparently, is frequently the cause of whole broods dying. The lack of proper food is also, no doubt, a prolific cause of disaster. One of the best suggestions we have lately seen is the recommendation to use an empty hay bay for early chickens, locating the coops in different corners. This would be just the place for young turkeys, provided they could have grass, finely chopped roots, or similar vegetable food. Such a place is, however, greatly exposed to depredations of rats, and these are great foes of young poultry of all kinds.

The food of all young animals is of an animal nature. In the earliest period of the existence of young birds, it consists of the yolk of the egg. On this they live before and for some time after they leave the shell. Turkeys and chickens are never hungry when first hatched, and may go at least two days unfed without harm. This is because a portion of the yolk of the egg remains in the digestive organs, to serve as food until they get familiar with the world and some of its responsibilities and cares. The gizzard is not yet in order to grind up hard grains like flint corn, simply cracked, or in the shape of coarse meal. The instincts of the mother bird are a tolerably good guide to the kind of food adapted to her young. Throw her some grain, or Indian meal wet up, and she will consume it with the greatest greediness herself; give, on the contrary, a soft worm or grub, and she will call her young to get it, and pick it to pieces for them. Hard boiled egg, mashed, and boiled liver, also mashed fine, are adapted to their easy digestion, and should be fed to them for the first few days at least, together with bread crumbs, fine Indian meal mush (cooked), and if they are not upon the ground, some clean, sharp sand.

Another excellent suggestion in regard to turkeys is made by Mr. J. A. Richardson, of Kane Co., Ill., who writes that they seldom lose a turkey, except by accident, if each brood is treated as follows: "We make a tight pen 12 feet square, and 16 inches high, of boards, and in this we place the young turkeys when first hatched, and let them remain until they are able to fly out. On one side of the pen we make a shelter of boards, to protect them from the sun and from the rains. We feed during the first week with boiled egg chopped fine, and good

wheat bread, in about equal quantities. The second week we give curd made by heating sour milk, and bread made of wheat shorts, or coarse flour. When three weeks old we give them dandelions chopped fine and mixed with their food. Up to this time we feed six times a day at regular intervals, and always furnish plenty of fresh water. When seven or eight weeks old wheat makes excellent feed. We use screenings or small wheat. The old turkey will not leave the young; consequently she is not confined."

A Check for Cribbers.

There have been all sorts of contrivances used to prevent cribbing horses exercising their "wind-sucking" propensity. It is doubtless well known to most of our readers what this propensity or habit is, but to explain it to all we introduce an engraving, figure 1, showing the head of a horse in the act of "sucking wind," or cribbing.

Fig. 1.—HORSE CRIBBING.

downward and backward with the teeth, the horse expels spasmodically a portion of wind from the stomach. This is constantly practiced by confirmed cribbers so long as they stand near any convenient rest for their teeth. It is not regarded as a constitutional unsoundness, neither is it a disease, though cribbers are generally hard to keep in good condition. Both by veterinarians and by the courts it has been held to be a bad habit, but not a vice. It is supposed to arise from indigestion, causing an accumulation of wind in the stomach,—something akin to dyspepsia,—which is relieved in a measure by the eructation of air. This is always difficult for the horse to do, hence the marked effort always made when it is accomplished in this way.

Among the devices to prevent cribbing are an iron muzzle for use in the stable, which permits eating but prevents cribbing, a tight throat-latch, hitching between two posts by a rein going to each, the removal

Fig. 2.—HITCHING REIN.

of mangers and cribs altogether from the stables, and feeding in tubs, or boxes, or on the floor. We were struck with the novelty and simplicity, as well as the perfect efficiency, of the device shown in fig. 2. It is the invention of Mr. Edward Dougherty, of Palisades, N. Y., who permits us to describe it for the benefit of all who have cribbing horses. It consists of a light rod of iron about two feet long, in one end of which is an eye set at right angles to the rod, to receive the hitching rein

and at the other end is a spring or snap-hook, to hook into the ring of the bit. With this a horse may be hitched to a post and will find it impossible to get his teeth upon it. The removal of the manger is the best way to prevent cribbing in the stable. The habit may probably be broken up, for a time at least, by an abundance of good food, good ventilation, and careful grooming, in connection with some efficient means of totally preventing its exercise both in the stable and out.

The Cultivation of Sorghum.

The past year was a very unfortunate one for sorghum growers. Confidence in the crop is seriously shaken, and the future is unpropitious for the makers of sorghum evaporators. Naturally enough, we have repeated inquiries as to whether we cannot or will not say an encouraging word to the farmers about planting sorghum. This word we are very willing to say. In fact, a crop which has for at least ten years excited so much interest that the cultivation of it has grown from nothing, in 1856, to 33,000,000 gallons, in 1866, would hardly, under any circumstances, be condemned for a failure no worse than that made by Indian corn or by potatoes.

We believe thoroughly in the crop, both for the North and South, East and West. The failure of the crop of '67 was not so much the fault of the plant as due to the fears of its cultivators, who had not the courage to plant as extensively as usual in an unfavorable or unpromising season.

Year before last we raised north of Mason's and Dixon's line one-tenth of the whole amount of syrup and molasses consumed; last year the product fell to between 6,000,000 and 10,000,000 gallons. The syrup now is scarce and high—in fact, but very little is in market, and people are willing to pay \$1.00 to \$1.25 per gallon for it, if well made. The processes for evaporating and purifying the syrup have been greatly improved since 1866, and it is not too much to say that the crop of the present year will far surpass in quality that of any previous one. For ourselves, we anticipate that it will be so good as to very easily supplant molasses with those who have hitherto refused to use it on account of its peculiar flavor. We cannot see any reason why all who cultivate sorghum this year with proper care, if they have good facilities for evaporating it, may not expect as profitable a crop as ever. It is not possible for enough to be planted seriously to affect the market.

We advise extensive planting, provided reliable seed can be obtained, and it can be put upon warm, generous corn ground. The soil must be well pulverized, mellow, and in good heart from recent manuring. It does well on fall-plowed sod. Give plaster, lime, or ashes, in the hill after the seed comes up, and keep clear of weeds. In regard to the variety of seed to plant, we can only say, that when sorghum growers and sorghum conventions disagree so essentially, we can only refer our readers to good growers or good seedsmen in their own sections of country for the best advice.

Deep Plowing—Safe and Unsafe.

"Do not, Mr. Editor, advise deep plowing—many a crop has been ruined by it."...."By deep plowing a farmer doubles the size of his farm."...."You have another farm lying six inches under the one you now till; only run the plow down into it." We have no hesitation in advising the gradual deepening of all soils that are retentive of manure, or that are inherently

fertile, and the fertility of which can be depended upon or kept up for a number of years. Thin soils, and those which do not hold manure, and are adapted chiefly to grain and grasses, need shallow culture, or such a system as will radically change their character, such as turning under crop after crop of green manure until the soil is full of vegetable matter. Clayey loams devoid of vegetable mold below a few inches, are often underlaid by what is known in the vulgate as *galler dirt*. It is dangerous to take up more than an inch or so of this untillied soil at each plowing, as it often contains salts of iron or other substances deleterious to vegetation. In general, however, even if a crop be injured, in the long run the deeper plowing, accompanied by good tillage, will be a great benefit. The greater portion of the Western prairies are of a character to be benefited by deep plowing. They even ought to be broken up by putting the plow down as deep as possible. We have held on to a letter from a Missouri correspondent, writing from near Hannibal, for some months, in order that, presenting it just at plowing time, it would do the greater good. He writes:

"In this section of our country we have passed through a severe drought. Our crops of oats, wheat, and hay, are the best we have harvested for many years, but our corn and potatoes have come nearer to being a complete failure than they have done here within the memory of the oldest settler. This season has not been without its lessons. Some farmers have learned a good lesson, and will profit by their experience, but more will not even learn at the fool's dear school, but follow in the same old way, and fail as before. Such seasons as the past show who are the good farmers. In looking around we saw here and there, few and far between, in the midst of general failure, a good crop of corn. Ask the reason. 'Why, sir, we plowed for our corn; no surface scratching, but with three good horses abreast, and the plow in up to the beam. We turned the weed seeds under so deep they gave us no trouble, and this deep bed of loose soil has retained moisture enough to mature a good crop without rain; that is the secret.' 'What is the cause of the difference between different parts of that field of wheat over there?' 'It is all in the plowing, sir. Twelve acres of that field were plowed in the common way, and six acres, joining in the same field, were plowed as deep as three horses could plow it. As a result, the six acres yielded as much as the twelve acres did, lacking three bushels.' It is deep plowing we need to insure our crops against drought. We have an abundance of rain in winter and spring to last our crops all summer, if we had some way of saving it; and the best way now is by deep plowing and subsoiling."

The Castor Oil Bean.

This plant is of tropical origin, and has about the same range of climate in which it may be profitably cultivated as the sweet potato. It is grown to a considerable extent in the southern half of Illinois, but the largest yield is in the extreme southern counties, showing that it needs a hot sun and a long season to give the largest amount of oil. The whole treatment of the plant up to harvest is much like that of Indian corn. The plants should not stand nearer than four feet, and the best cultivators place the rows seven feet each way. The plant is a rank grower, and wants plenty of food and sunlight. The Florida beans are considered better than the Spanish for producing oil. Two beans are usu-

ally planted in a hill, but one should be taken out when the plants are six inches high. The cultivation may all be done by horse-power, but care should be taken not to wound the stalks or break off any of the limbs. Cultivating five or six times is none too much to secure the best results. The proper time for planting in southern Illinois is about the 1st of May, and by the middle of August some of the stalks will be fit to cut. This should be done when the bottoms of the spikes yielding the beans begin to turn brown and crack open. It pays to have a drying house for the curing of the beans, and a plan of one is given in the *May Agriculturist*, 1867. Drying yards are discarded by skillful cultivators. This crop is usually planted upon the poorest land, and is thought by some to improve it quite as much as clover. The average yield under fair treatment is about twenty bushels to the acre. The price of the beans varies much more than that of ordinary farm crops. During the past year the price has ranged from \$3.90 to \$1.25 per bushel, in the St. Louis market, where most of the oil used in this country is manufactured. We have no doubt that our California correspondent can raise the beans in that State, but do not think the crop will be more profitable than many others he might grow. Previous to the war it was so largely raised in Southern Illinois that it ceased to pay on account of over-production. The war caused a great advance in the price of the oil, and the cultivation is now increasing. An acre of the beans, or twenty bushels, will yield about 68 gallons of oil, worth at present prices about \$150. Those who raise the beans think the manufacturing pays much better than the cultivation. Possibly the farmers who raise this crop could form a joint-stock company and press the oil out of their own beans to advantage. We believe the business of pressing the oil in this country has been almost a monopoly, and that one man has made a large fortune by it.

Lancaster Co., Pa.—Rotation of Crops.

A correspondent, using the signature "Pequen," gives so clear a statement of the mode of farming pursued in the fertile valleys of the Conestoga and other rivers of Lancaster County, that we present his letter, slightly abbreviated.

"As an agricultural district, Lancaster County has always held high rank; at this time, its produce is double what it was fifty years ago. At no time has it advanced more rapidly than it is doing at present, and there is room for further increase of its agricultural productions. Commercial fertilizers, except lime, are not yet generally used. Farmers are, however, alive to the importance of husbanding their means for making barn-yard manure. Very few of our farmers will sell straw, however abundant it may be, and many will not sell hay under any circumstances.

"Rotation in crops is a universal practice, but not quite that which you designate in the article on page 37, (February No.). Lime is very generally used, and as you say, put on the sod, and then plowed down, or else spread on the surface after plowing,—generally the latter. The first spring, corn is planted; the second season, either oats or wheat; the third, wheat again, seeding with timothy or clover; fourth and fifth seasons, grass; then corn again, and the old routine over. It is a very rare thing to see the land lie fallow the second year. It is too high in price to lose a crop. If it is designed to have a crop of wheat the second year, the corn is cut off in September, about 2 or 2½ feet

from the ground, and shocked in rows, so as to leave spaces 20 to 30 rows wide. A harrow or heavy roller is passed over these stubs in the direction in which it is designed to run the plow, so as to break them down and favor their being well covered by the plow. After plowing, the roller is again passed over, and the wheat is then drilled in. They usually make it a point to drill in the wheat before the plowed ground gets rain. Neat and experienced farmers do this so nicely, as to leave very few corn stubs on the surface. The corn is left standing in the shock until it is sufficiently dry to harvest and house, when it is husked, and, with the fodder, hauled from the ground. After this crop is taken off, the ground is well manured, and plowed as early after harvest as circumstances will permit, and again seeded in wheat, with which it is set to grass. The liming is not often repeated under 12 or 15 years. Sowing wheat upon corn ground in the manner described is a very general and successful practice; from 20 to 25 and even 30 and more bushels of wheat to the acre are yielded. Where land is in good condition, it is thought to pay much better than oats, as in strong land they are apt to fall, and be light in the head or grain. Some very good farmers let their grass fields lie but one year before turning them over; but generally they are left two, though rarely more. Some farmers put in two crops of corn in succession, manuring the ground well before putting in the second crop, and then follow with wheat, as above stated. Some put a coat of manure on the sod before turning it down for corn. This secures a good crop of wheat after the corn, but if another coat is not given with the second crop of wheat, the grass will not be so heavy. I know a farmer who put a moderate coat of manure on the sod, turned it down, and planted in corn, seeded in wheat in the fall, and next summer put a moderate coat on the stubbles; plowed and sowed wheat again, seeding to timothy and clover, and left the land two years in grass. The farm was divided into five fields, which gave him one for corn, two for wheat, and two for grass, and brought them round in regular order. His wheat was almost invariably good, yielding from 25 to over 30 bushels per acre. Judging from the success and prosperity of our farmers, I think there are few places which excel us, and many which might profitably follow our example. There are many sections where the soil is rich and strong, which I believe would profitably bear the system of culture we practice. Forty to fifty bushels of corn to the acre is a moderate crop on our best land; seventy to eighty is good, and is sometimes exceeded."

Subsoiling—A Defense Against Drouth.

The theory of subsoil plowing has been frequently explained in the *Agriculturist*, and the practice has been advocated for the last quarter of a century. Nevertheless, the use of a subsoil plow is a rarity on American farms, and almost always marks a really progressive farmer. The action of a mole near the surface represents tolerably well the manner in which a subsoil plow works, only at such a depth that little or no elevation of the top soil is visible, while more ground is moved in proportion. These plows are usually employed following in the furrow of a common plow, and driven as deep as the team is capable of drawing them. Crops upon land thus prepared are much more likely to send their roots deeply, to gain more nutriment, to sustain themselves during drouth, and to mature heavier crops, than where subsoiling is

not practiced. Indeed, the only circumstances under which a subsoil plow does not work to the advantage of the crops, is on very light, thin, leachy land, and where the water stands within a few inches of the surface. For corn, potatoes, and roots, this preparation is expedient, and for the latter class of crops especially so. Subsoil plows are of steel and cast iron, and are of either the lifting or mole patterns. The lifting subsoil plows may have a wing (which takes the place of a mould-board in common plows), on one or on both sides of the standard. There is a great diversity of sizes, from the admirable little one-horse plows, used to run between the rows of root crops and potatoes after the ground has been compacted by the horse hoe or cultivator, to those requiring a team of three or four horses to draw them. There is not a crop which the subsoil plow may not greatly benefit, either in the preparation of the soil or in the summer culture.

Grubs and Their Work.

Those insects which in their grub state live underground are among the most annoying to the cultivator. Their presence is not suspected until their mischief is done, and the task of attacking them in their concealment is a difficult one. The grubs greedily devour the roots of plants and do not seem to be particular as to the variety; they are equally destructive in the vegetable and fruit garden, and nursery, as in the meadows and fields. Strawberry and raspberry plants suffer much from their attacks, and the annual loss in young nursery trees may be estimated at thousands of dollars. The most common of these destructive grubs is that known as the

Fig. 1.

White Grub, the larva of the common May-bug, (*Lachnosterna fusca*), the brown beetle so common in the first warm days of spring. This beetle (fig. 1) is destructive in its perfect state and feeds on foliage and flowers. The beetles are very lively during the evening, but are quiet towards morning, and gather in the trees, from which they may be shaken upon sheets and collected in large numbers. They must be captured very early, as they fall to the ground about daybreak and conceal themselves in the grass. The female lays her eggs in the ground, and the larva, which lives for several years, attains the size of the little finger. Its body is soft and white, with six legs; the head is hard and horn-like, and of a light mahogany color. When found, the body of the grub is curled up in a semicircular form, as shown in figure 2. Probably the grubs of a number of species are equally mischievous, though that of the Muck-worm, which is so often found in manure heaps, and is in general appearance like the White Grub, is said to live on decaying vegetable matter only, and is comparatively harmless. The grub of the Muck-worm is lead-colored throughout, from the contents of the intestines showing through the semi-transparent body, while that of the White Grub shows the lead color only near the tail. Cut-worms, also very destructive, are the larvae of moths and not of beetles, and differ altogether in their habits. The larva of the Tumble-bug (*Caution laris*), which has not formerly been classed among the

Fig. 2.

injurious insects, is probably as bad as the rest. It is the common impression that the grub of the Tumble-bug feeds only on manure. The balls of manure containing the eggs which the insect so industriously rolls about are buried in the ground, the manure apparently serving as delicate food for the grub while young. Margaret Chappellsmith, of New Harmony, Ind., sends us an account of her observations on this insect, from which we extract the following:

"The ball of dung made by the two Tumble-bugs contains, I think, about seventy eggs, and the amount of dung contained in the ball is a very inadequate supply of food for the number of grubs to be developed from these eggs. If dung were to be their food, why do not the parent bugs leave their ball in the heap from which they have taken the dung? Every one knows that the ball is found more frequently where there is not any dung than among dung. I have seen two Tumble-bugs roll their ball from my dung-heap down a long path, then turn up another one by the side of a strawberry-bed, then up the little elevation of the bed, and then make the hole into which they dropped the ball, by the side of a strawberry plant. I have seen another pair of these bugs come in another direction, down one path from the dung-heap, then down another long path, then up a little bank to a rhubarb plant, and there, by its crown, make the hole for their ball. They do this without hesitation, having evidently fixed on the feeding ground for their young beforehand. I kill the bugs and burn their balls.

"I dig for the eggs of the June Bug. This creature makes holes in the earth, and at about one foot down it deposits its eggs, each egg separated from the rest by earth. I dig up a spadeful of earth, and if I find one egg, I search until I have found at least thirty; but I have found above sixty in one hole. In last July and August I dug up about 1,400 of these eggs; and might have found many more but for the dry state of the earth. They are hatched in a very short time, and then are not so easily found.

"In the Semi-Weekly Tribune of Feb. 27, the idea is indirectly conveyed, that the frost in this country kills the grubs. This will not be believed by any one who has much knowledge on the subject. Nor would any one believe it who reflects on the variety of insects that, above ground, survive frosts which here vary from about zero to twenty-one degrees below it; as, for instance, do squash bugs, and the chrysalids of moths and butterflies which hang from trees, window sills, and fences. The grubs are protected by the earth, and by that which lies on the earth; and many of them abide in cold weather, when undergoing their transformation, at a depth of two feet below the surface."

The larva of the beautiful Gold-bug or Goldsmith beetle, must be included among the injurious grubs. The many who have written us for directions to destroy the grubs will see that the work must be a slow one, and that there is no specific to be recommended. Kill the insects in every stage, whether of beetle, larva, or egg. The catching of the beetles has already been referred to, as the destruction of one female prevents the production of many grubs. Whenever a grub is turned up in working the soil it should be destroyed. When a strawberry or other plant suddenly wilts, dig down and find the grub. Encourage fowls to follow the plow, and in meadows that are badly infested, turn in hogs and let them root. In France, considerable reliance is placed upon the hedgehog as an aid in destroying a similar, but different grub.

GROUP OF FANCY PIGEONS. — Drawn and Engraved for the American Agriculturist.

In all civilized countries from India to China, through Asia and Europe to America, people are familiar with the common Pigeon or Dove in some of its many varieties, or breeds, which, when bred without care, or allowed to mingle, soon revert to a form in many respects much like the wild Rock Pigeon of the Eastern Hemisphere, from which they are all descended. The Rock Pigeon is one of the most easily domesticated of birds. Young ones taken from the nest and reared by hand seem to have no inclination to return to their wild habits. The result has been, that, wherever the wild bird is found, the inhabitants have always, so far as we know, had tame pigeons. In a state of domestication, peculiarities of form and plumage have been observed, and expressly propagated, so that there is hardly a doubt, that through careful selection made by pigeon breeders for hundreds or thousands of years, many of the most peculiar and beautiful of the varieties have been formed. In the above striking engraving we present a group of a few very marked examples of variation in form and plumage exhibited in some of the most highly prized breeds of pigeons. The figure occupying the centre of the group is the English Pouter. All pigeons have the

faculty of inflating their throats, in a measure, but the Pouter inflates its entire crop to the extent exhibited or even more, and does this apparently for its own amusement. The desirable points in a Pouter pigeon are great length of limb and length of feather, with slenderness of body, large size and symmetry of the inflated crop, and attractiveness of color, in which great variation is allowable. These Pouters are very large pigeons, but other kinds are of less size; in fact, a breed of Pigny Pouters is highly prized. The Isabels, one of which is seen on the wall, panted like a Miss of ten years, are a continental variety, of a fawn, or pale reddish yellow color. The conspicuous black bird with the enormous mass of carunculated flesh about the eye and upon the beak is the English Carrier—a large, strong-bodied, long-winged, beautiful-plumaged bird, whose merit in the eye of the fancier is the size and perfection of the deformities upon his head, called the eye-wattle and the beak-wattle. The beak is very long, and the colors are white, black, dark dun and blue. This bird is not used as a letter carrier, as might be supposed, though originally it might have been so employed, for it doubtless possesses great sagacity and a strong flight. The birds

which are employed as message bearers and for flying matches are known as Homing birds, because when carried away they fly home again. Among those thus used are the Antwerps, one of which is on the right of the picture, and Dragons, represented by the bird on the left, partly hidden by the shoulders of the Carrier. The most successful match-flying birds are said to be crosses between these and some other varieties, as, for instance, Antwerps and Owls. The bird with a ruffled bosom on the extreme right is what is called an "Owl." The Suabians are a small but very beautiful German variety with gaily spangled plumage; one is introduced in the engraving but somewhat hidden by the Carrier and Dragon. There are numerous other very beautiful breeds of pigeons of well established characteristics; and the careful breeding of any of them is, like the culture of flowers, of little "practical use," but a great pleasure. The pigeon fancier, in the beginning, should not undertake to breed his favorites for profit, but for enjoyment, although there is a ready sale for fine specimens. The prices which have been paid in England for birds of extraordinary merit are astonishing—for instance, £10 to £20 for a single bird is not an unusual occurrence.

Flowering Shrubs.—The Hydrangeas.

The old Garden Hydrangea (*H. Hortensia*) is well known; its large, globular heads of flowers, usually pink, but sometimes blue, make it a conspicuous object in garden decoration. It should have shade and moisture and a rich peaty soil, to flower in perfection. The plant survives the winter in the climate of New York, though a part of the young growth is usually killed. The best way is to grow it in boxes or tubs, which can be put into the cellar in winter, or the plants can be taken up and heeled-in where they will be protected from frost.

A recently introduced Hydrangea from Japan is quite as showy as the old *Hortensia*, and perfectly hardy. It is *Hydrangea paniculata grandiflora*—a rather long name, which would translate into the equally unwieldy Large-flowered Panicle Hydrangea. It was introduced into this country directly from Japan, and is known to some of our florists as *Hydrangea deutziaefolia*, a name which was given it from the resemblance of the leaves to those of the *Deutzia*, before it was ascertained that it was a variety of *H. paniculata*. The shrub grows to the height of 8 feet, and bears a great abundance of flowers, resembling in general appearance those of *H. Hortensia*, but the clusters, instead of being globular, are somewhat pyramidal, and are a foot or 18 inches long. The flowers are at first of a yellowish green; they afterwards become pure white, and finally are beautifully tinged with pale rose. We have never seen this grow as finely as it does in the grounds of Parsons & Co., Flushing, L. I., where it is justly considered one of the most valuable ornamental shrubs of recent introduction. We have figured a very small specimen, to show the shape of the leaves and flowers, as it would be impracticable to give a full-sized cluster. In the Hydrangeas the fertile flowers are small and inconspicuous, while the showy ones, those that make the plants valued as ornamental, are sterile, and have neither stamens or pistils. In the species just noticed the sterile flowers are so abundant as to completely hide the fertile ones, while in our native *H. radiata*, (*H. nivea* of the catalogues,) the showy sterile flowers form only a single row around the cluster.

THE MINER PLUM.

Native Plums.—The Miner and Others.

Numerous bits of evidence point to the conclusion that the Miner Plum, about which so much has been said, is only a good specimen of the Chickasaw Plum of the West. "A subscriber," Franklin, Tenn., gives the following account of the Chickasaw. We figure the plum which came to us as the Miner, but unfortunately

without leaves. "It is a native of Middle Tennessee, and has been known here as a native plum ever since the first settlement. I have seen two or three specimens growing wild in the forest, and in many respects it is the finest plum grown in our State. With its fruit grows to the size of a partridge egg, is of a deep red color, with firm, yellow pulp, and when thoroughly ripe is exceedingly well flavored, and

HYDRANGEA PANICULATA GRANDIFLORA.

will bear transportation in barrels equal to the cranberry. Our ladies esteem it most highly for the purpose of making jellies, its tartness being an objection to some as a table fruit. Some years ago Dr. S. P. Hildreth, formerly a resident of Ohio, sent back some of the fruit of this plum to his friends in Cincinnati, who where so well pleased with its keeping and transporting properties that they planted the seeds and sent to him for cuttings, etc. Ten or twelve years ago he sent large quantities of seeds and cuttings to his friends in Ohio, and I would not be surprised if in this way the fruit has become pretty generally disseminated. It is extremely hardy, and as a preserving and jelly plum has no equal with us. We have another variety called the "Wild Goose" plum and by some the "Nolen" plum, which as an edible plum excels every known variety. In size it is equal to the "Green Gage," is exceedingly juicy and sweet, almost purple in color, with a bloom like the grape, which is rubbed off by the slightest touch. For the table the "Wild Goose" excels all others, but for prunes and other purposes above detailed the Chickasaw has no equal. There is another variety of plum, called the "Wild Goose," extensively known and cultivated, but it is wholly unlike, and very much inferior to our native Wild Goose or Nolen plum." Pomologists should look after the native plums.

Shrubs for Cemeteries.

In properly arranged cemeteries there are neither fences, hedges, or any other enclosures; inconspicuous stones being used to mark the corners of the lots. In such cases the planting is all a part of one general plan, without the intrusion of individual tastes to mar its unity. Cemeteries like these are rare, and much more commonly each lot is arranged and decorated according to the views of the owner. In planting of this kind, shrubs should be chosen the expression of which is cheerful and pleasing, without presenting striking or gaudy colors. The most useful shrubs for this purpose are the low-growing evergreens; the larger trees of this character should be freely used in the general planting, but we now wish to speak of those things which are left to individual effort. Among the evergreens we include the European Ivy, one of the most useful of them all. Where the custom prevails of making a mound over the grave, it can be covered with a dense mantle of living green by the use of a few plants of Ivy. Most of the Junipers are useful, and give us a great variety in height, from the Prostrate Juniper, which lies flat upon the ground, to moderate sized trees. The Torreya of Florida is hardy at the North and makes a beautiful, large shrub. The Dwarf Pine (*Pinus pumilio*) and some other low-growing kinds, are useful. The different Arbor Vitæ give us quite a variety in color and size. The Golden Arbor Vitæ (*Biota orientalis aurea*), is most beautiful, and our native Arbor Vitæ (*Thuja occidentalis*) has varied so much that we have a dozen or so of named varieties. The Yews, which have been used for ages for this purpose, are some of them hardy; our native variety (*Taxus baccata*, var. *Canadensis*) improves greatly in cultivation. All the above are to be had at any nursery at moderate prices.

Deciduous shrubs present a long list from which to select, and we enumerate a few of the readily obtainable ones. *Deutzia gracilis* and the double variety of *Deutzia crenata*; *Daphne Cneorum*; several of the Mock Oranges or *Syringas* (*Philadelphus*); *Spiræas* in great number; White Persian Lilacs; several *Viburnums*, native and foreign; the *Clethra* of our own swamps; *Honeysuckles* of the upright kind; *Weigelas*, and many others, both wild and exotic.

The Prickly-fruited Gherkin.

Among the odd vegetables cultivated by the curious is the Prickly-fruited Gherkin, known also as the Jamaica and West India Cucumber. It is unlike the common cucumber in appearance, and, indeed, belongs to a different species, *Cucumis Anguria*. It is of an oval shape, about two inches long and a little more than half an inch across. The surface is thickly covered with soft spines, pale green, but of a clear yellow when fully ripe. The seeds are numerous and small. The principal use is in the green state

for pickles, for which it is prized by some. A correspondent, whose name we have mislaid, says: "The West India Burr Gherkin, or Oyster Gherkin, is easily raised. Plant in hills 3 or 4 feet apart like other cucumbers, say twenty seeds in a hill, for the small black fleas are very fond of them; thin out to two plants. They are generally made into pickles, but are much better and more wholesome cooked. Cut in two and boil, and season as may be desired." The term Gherkin is properly applied to a small pickled cucumber. We know of an instance in which a farmer who wished to raise cucumbers for pickles sent to a seedsman for the seeds of Gherkins and received those of this plant. He did not find out the mistake until his acre of plants began to bear this small, prickly fruit.

The Grape Vine—How it Grows and What to Do with it.—3d Article.

In procuring vines it is best to get good one-year-old plants—older plants, or layers, may be

Fig. 5.—AN UNPRUNED VINE.

equally good in certain cases, but not generally so. The manner of planting is sufficiently described in Notes for the Month. The vine consists of a mass of roots attached to a greater or less length of stem. If the variety is rare the stem will have but two or three buds, but often it will be two or three feet long. If a young vine, cut it off to three buds before planting. The questions will be asked, "What for? Why not let all the buds remain? What is the use of cutting away so much vine?" It does seem unnecessary to destroy such an amount of growth, and the questions are natural ones. An answer to them is to answer the query of "Why prune at all?" Upon pruning, and pruning intelligently, the whole success of vine-growing depends. If a young vine, three, four, or more feet in length, were planted, and, as is often the case, left to itself, most of the buds would throw out shoots, the uppermost being the most vigorous. The next year nearly all of the buds on this growth would push, and another set of shoots would ripen into canes. Each year, the uppermost buds being the strongest, we should have the new growth further and farther from the root. It has already been shown that the fruit is produced only on the new shoots, and that after a shoot has ripened into a cane it produces no more fruit, though it bears buds which will give rise to fruit-bearing shoots. There is, then,

in a vine left to itself, a yearly accumulation of unproductive and useless wood; an annual increase in the distance between the fruit-bearing shoots and the root; and where so many shoots have to be nourished, they will be weak, and the fruit, consequently, of inferior quality. There are other reasons for pruning, but these are sufficient. Compare a vine, fig. 5, which has been allowed to grow upon a tree at will, with figure 6, a vine trained by one of the simple methods, and the difference will be manifest.

To return to the treatment of the young vine at planting, which was to be cut back to three buds. It is very important to get the vine well established, with a good root and strong canes. Instead of allowing the young vine to produce several shoots, we leave but three buds, and when these have fairly started, rub off all but the strongest one. The object in leaving three buds is to guard against any accident. All the nutriment that would have gone into several buds is here directed to one, and the shoot will make a rapid growth, and at the end of the season will be from four to ten or more feet long. It will be just such a shoot as was described in February, but being a young vine will have no fruit. It must be kept tied up to a stake as it grows. Laterals will be produced at each leaf, as described last month. These, if left, will produce a number of side shoots. Whether they should be allowed to grow at will on a young vine, or be stopped in their growth, is a point upon which cultivators differ. Those who allow them to grow do so in the belief that the young plant needs all the leaves to aid in forming a strong cane and root, while those who check their growth and thus diminish the leaf surface, claim that the remaining leaves become larger, more robust, and hence more capable of resisting disease, and though the number of leaves is less, a more efficient surface of foliage is obtained on the whole. Besides this the whole length of the cane ripens more thoroughly.

In large vineyards perhaps the advantages gained by checking the laterals do not war-

Fig. 7.—THE LATERAL.

rant the expense, but otherwise we think it preferable to do so. The lateral was described last month, and for convenience we reproduce the figure here. This (fig. 7) shows a node with

its leaf, dormant bud, and lateral. If the lateral were broken entirely off, the bud, which should have remained quiet, would push; this is not only not desirable, but injurious to the future prospects of the vine. When the lateral has grown so long that two or three leaves are visible, all but the lower one are to be removed by pinching off the tender shoot with the thumb and finger, as at *a*, in the figure. The leaf that is left will soon increase in size, and at its axil a bud will push, the growth from which is to be in turn pinched back to one leaf (see *b* in the figure) and should another growth start from this, pinch it at *c*, and so on. Two or three pinchings are all that is generally required.

The whole care the first year is to secure a single cane as strong and well-ripened as possible, with well-developed buds and a correspondingly well-ripened root. It will, of course, be understood that the ground is to be kept clean, and the surface open by cultivation. The young vine being in this condition, what is next to be done with it? When the leaves have fallen, cut again down to three buds. Just here is where the novice is apt to fail; he has devoted all one summer to his vine, it has a beautiful cane, perhaps eight or ten feet long, and why should it not be left to grow larger and finer another year, and, it may be, give some fruit? It is a natural feeling, and it requires some faith to believe that good will come of this destroying what has been produced with so much care. If one desires a good vine, no matter what is to be the future method of training, the second year must, like the first, be given to the growth of a single cane. Therefore in the autumn down it goes to three buds, a shoot from one of which is trained and cared for, as already described, the next spring. This one shoot having all to itself the root that would otherwise have been shared by many shoots, will push with great vigor, and form a much finer cane than the year before, and the vine may be considered as established, and a subject for any of the modes of training that we may hereafter illustrate. If, however, the second year's growth has been a weak one, the cutting back process must be repeated until a strong cane, a half inch in diameter, is obtained.

About Lawns and Grass Plots.

No matter how fine the trees and shrubs, or how beautiful the flowers, these do not show half their beauty unless set off by a carpet of grass. It is one of those embellishments that are within reach of almost every one, and conduces more to the attractiveness of a place, be it small or large, than anything else. Any well-kept surface of grass near the house is called a lawn, but those who do not like to be pretentious call their smaller areas grass plots. Whether large or small, to be permanent and satisfactory the work must be done more thoroughly than it generally is. It is true that we can point to some very fine examples, but much oftener the surface presents inequalities, the grass burns out in summer, and often misguidedly gets such a foothold that the lawn, instead of being a pleasure, is a nuisance. There is an impression that grass will grow anywhere and on any kind of soil, while the fact is that the land that is to bear grass that will be undisturbed for many years needs very thorough preparation. Draining is in most cases advisable, and deep working of the soil absolutely essential. Small places may be trenched, but larger ones are worked with the plow and subsoiler. An abundance of good manure should be applied,

the soil prepared as thoroughly as for a garden crop. Levelling must be attended to—not that the whole surface should be a dead level, but there must be no inequalities of surface. The ground being manured, plowed, harrowed, levelled, and rolled, is ready for the seed. It is a good plan to delay sowing the seed for a few days, to allow any unevenness in the preparation to show itself, in which case hollows must be filled up and the surface again rolled.

Where the land is woody it is a frequent custom to devote it the first year to potatoes or other hoed crop. On poor land, for which there is not sufficient manure, it is well to turn under green crops to aid in fertilizing it.

Any kind of spring grain may be sown, and before it comes into blossom, turn it under with a dressing of lime, then sow grain again and plow under the green crop as before, and after leveling and harrowing, sow grass seed in the fall.

The kind of seed to be used is of much importance. The imported "lawn grass" mixtures are generally unsatisfactory; we have tried them several times, and obtained only a sward of white clover. We know of successful lawns made with only one kind of grass, either the June grass, or Kentucky Blue-grass, as it is called, (*Poa pratensis*), or Red-top (*Agrostis vulgaris*). The Red-top makes the most velvety turf, but the June or Blue-grass stands the summer better.

Meehan recommends a mixture of one-third Ray-grass (*Lolium perenne*) and two-thirds June grass. We have not seen this used, but it is given on good authority. Some recommend a mixture containing Timothy; this should always be avoided, as the tendency of that grass is to form strong tussocks which soon make an uneven surface to the lawn. The quantity of seed is a point upon which practice differs. Thick seeding is undoubtedly advantageous, but it may be overdone. Perhaps three bushels to the acre may be given as the medium. Some add white clover to the grass seed, and others, again, add a small proportion of the seed of the Sweet-scented Vernal-grass for the sake of the pleasant odor given off when the grass is mown. When the lawn is made in spring it is not necessary to sow grain with the grass, as is sometimes done, though it is beneficial when the lawn is seeded in the fall. The subsequent management of the lawn as well as the turfing of small plots must be left for another article.

The Red Cedar.

The Red Cedar is a much more important tree at the West than people at the East have any idea of. It grows with great rapidity, and has an appearance of thrift and vigor that would surprise one who had only seen it along the seaboard. It is in such request, not only for ornamental planting, but for the economical purpose of shelter, to both of which uses it is admirably suited, that great interest is felt in its propagation. The seeds, as planted ordinarily, will stay in the ground two, and sometimes three years before they germinate. Mr. Samuel Edwards, of Illinois, recommends mixing the seed with moistened ashes, with the view of making them more permeable to moisture. Mr. F. Lee, of Clark Co., Ill., thinks he has a better and easier mode. He says: "Put in a sack as much seed as you wish to grow, place the sack in a kettle of boiling water, and allow it to remain for about five minutes. Take them out and rub with the hands to remove the pulp, and the seeds are ready to put in the ground; plant in drills a foot apart, in soil where clay predom-

ates, on the shady side of a fence running east and west. The shade of the fence keeps the ground moist. I have seen my mother grow hundreds of cedars by this simple process. The seed should be planted about March 1st in this latitude (39°); farther north, later would do."

The Quince—Culture and Varieties.

"Quinces are a profitable fruit, why do you not oftener recommend them to be planted?" writes some one. It would be much more to the purpose if we were to advise care of them after they are planted. Generally a quince tree is little else than a nuisance! Planted in a low corner and left to itself, it forms any amount of suckers, and these, with the interlaced branches, make a thicket rather than a tree. Young trees need a few years' care in training and pruning, and then they form beautiful objects, whether in flower or in fruit. The popular notion that the quince needs a very moist soil is a mistake; set the young trees in good, rich, deeply worked soil, such as is fit for other trees, cultivate well,

basis upon which to form an evenly balanced and open head. For a head higher up, a single straight stem must be trained. If the nursery tree is crooked, let it grow a year, and next spring cut it down to near the ground, allowing but a single shoot to grow. This must be kept tied to a stake as if it were a vine. The next spring shorten it back to a good bud, cut back the side shoots to two or three buds, and tie the upper shoot to the stake for a leader. When a good self-supporting stem is obtained by this management, the head may be formed at the height of three feet. The variety most common is the Apple quince; the Pear quince is also much grown. Pomologists differ in opinion as to which is the better of the two, probably for the reason that seedlings have been produced differing somewhat in quality. The Portugal is esteemed better than either, but is a poor bearer. The Angers, the variety so much used for pear stocks, is said to give a good fruit, but it is seldom grown for this purpose. It is singular that so few experiments have been made to produce new varieties of this old and generally valued fruit. The only one that

REA'S SEEDLING QUINCE.

manure if needed, and they will pay. The application of an occasional dressing of salt is said, on good authority, to be beneficial. Twelve feet apart each way is the usual distance for the quince. The treatment of the young tree will depend upon the height at which the head is desired. A young quince tree, as sent from the nursery, is usually very twiggy and unpromising in appearance. For a low-headed tree cut off all the lower branches so as to get a clean stem for 18 inches; above that select four of the best branches that are evenly distributed around the stem, and shorten these to three buds each; cut all the rest away, top included. Suckers and all growths that push, other than those from these buds, are to be rubbed out, and thus is secured a

appeared in our fruit lists is Rea's Seedling, which originated in Green Co., N. Y. We were much pleased with the appearance of this variety in the grounds of Ellwanger & Barry; the tree is a good grower, a good bearer; the fruit large, fair, and of excellent quality. We give an engraving of a specimen obtained at the time. The quince, except the Portugal, is readily raised from cuttings, and any one can grow young trees with but little trouble. It is best to select the cuttings from bearing trees, the quality of the fruit of which is known; they should be about a foot long, and from wood of last year's growth. These are best cut in autumn and kept buried during the winter, but fair success may be had with spring set cuttings

in a bed that can be watered in case of drouth. See note on Planting Cuttings in March "Basket." Prune neglected and unfruitful trees into shape and give them a good dressing of manure, and dig out borers, which are apt to trouble the quince.

Peach Culture.

New land of sufficiently good quality to produce grain crops is best. Light land is selected, as the trees come into bearing soon, but those on heavy soil, if well drained, last longer. Situation has much to do with success; a cold much below zero will destroy the vitality of the flower buds, especially if the cold occurs just after a warm spell. So uncertain is the crop

from this and other causes that cultivators think themselves fortunate if they have two good crops in five years. Ordinarily the land is plowed as for grain, but deep working would be much better. Twenty feet apart is the usual distance for planting. Before planting, the trees should be examined for any signs of the borer, and if found, the grub must be cut out. The trees should be cut back to the distance at which it is desired to form the head. The usual practice is to head the trees at three or four feet from the ground, but some form it much lower. The spaces between the trees are cultivated in corn,

potatoes, or other crops, and it is a common practice to sow buckwheat in the orchard. The trees usually come into bearing the third year after planting, when the growing of crops is discontinued, but weeds are kept down by the use of the plow and harrow. In ordinary culture but little pruning is done, except to remove broken and diseased limbs, but there is no doubt it would pay to shorten in the new growth, not only in increased fruitfulness, but in the greater longevity of the tree. When the peach is allowed to grow without shortening the limbs, they elongate and the tree becomes straggling, and the fruit being borne at the extremities of the branches they often break down with the weight. By cutting off half or two-thirds of the previous season's growth each spring, and at the same time thinning out crowded or useless shoots, a round, compact head is formed, and a supply of young wood—which is necessary to continued fruitfulness—is maintained. Besides the injury from extreme cold, the cultivator has to contend with the curl, the yellows, and the borer. Good cultivation is the best preventive of the curl. The yellows is less liable to appear on new land, but wherever it appears the only remedy is to convert the tree into fire-wood. Various plans have been devised to keep the borers out. One is to make a bank of earth a foot high around the trees in June, and level it just before it freezes; another is to draw the earth away from the tree so as to uncover the collar and upper portion of the large roots; in either case the object is to expose the borers, which have not yet entered the tree, to the attacks of birds and to freezing. Wrapping with paper or other protecting material, and other devices for preventing the borer from entering, have been suggested. None of these will do away with the necessity for watchfulness. Whenever the gum exudes, the borer is to be looked for; cut it out at once with the knife or gouge.

Varieties are numerous, and each peach region has some peculiar to itself, or old sorts under local names. The selection of one grower in Southern New Jersey is Troth's Early, Walter's Early, Harker's Seedling, Oldmixon Free, Ketchell's Favorite, Crawford's Early, Crawford's Late, and Stump of the World. This list does not include Hale's Early, earlier by ten days than Troth's, nor Early York, nor Honest John, Ward's Late, and others that are much grown in New Jersey. The late Mr. White's selection for the South is Early Tillotson, Crawford's Early, Stump of the World, Oldmixon Cling, Washington Cling, Heath Cling.

The Missouri Horticultural Society recently discussed Peaches, and a committee reported a useful table of the times of ripening of the

different varieties at St. Louis. Of course the times given will be earlier than in less favored localities, but the differences will remain about the same. Hale's Early, July 20th; Troth's Early, July 30th; Large Early York, Aug. 7th; Yellow Rarieripe and Crawford's Early, Aug. 10th; Oldmixon Free, Aug. 20th; Oldmixon Cling, Aug. 25th; President and Morris White, left blank; Stump of the World, Aug. 30th; Columbia, Sept. 5th; Crawford's Late, Sept. 10th; Washington Cling, Sept. 15th; Ward's Late and Late Admiral, Sept. 20th; Smock and La Grange, Sept. 25th; Heath, Sept. 30th.

THE LEATHER-LEAF.—(*Cassandra calyculata*.)

The Leather-Leaf.—(*Cassandra calyculata*.)

In April there may be found along the edges of swamps and in boggy meadows a little shrub, the Leather-leaf, with flowers of such a pure white, and altogether so neat and attractive in its appearance, that one is tempted to gather it, even at the risk of wet feet. It has always been a great favorite with us, as it not only comes very early in the spring, but is one of the few of our wild flowers that will allow us to anticipate their season of bloom by forcing in a warm room. The buds of the Leather-leaf are formed the preceding summer, and are ready to open on a slight provocation. A handful of the branches gathered in mid-winter will flower in perfection if placed in a glass of water in-doors.

The Cassandra, which is a much prettier

name than Leather-leaf, is quite common at the East and North; it is a branching shrub, from 2 to 4 feet high, with thick, dusty looking leaves, which remain upon the branches all winter until the flowers open. The little egg-shaped, white flowers are borne in the axils of the leaves along the branches, and form a one-sided cluster. The engraving shows a flowering branch of the natural size. This species is prized in England, where it is found in collections of "American plants," but it is seldom seen in cultivation in our gardens. A friend succeeds in growing it by using a plenty of muck in the soil. With a little pains to imitate in a measure the natural condition of the plant, this early flowering shrub could no doubt be cultivated in our gardens with success. This was formerly called *Andromeda calyculata*.

SAVE THE EARLIEST.—We have often advised those who save their own seed to select the earliest and best. "J. G. C.," of Wickford, R. I., a gentleman who gives us a case in point, though at the advanced age of 87, still keeps up an interest in gardening. "I have cultivated one kind of peas, called the Early Junes, thirty-two years, and have the date of planting and first picking each year. The last ten years they have averaged four and a half days earlier than the first ten, which I attribute to the method of selecting the seed. Instead of saving all that grows on a portion of the vines, I save the first setting of the whole, and pick them as soon as fully ripe. The Early Junes are very prolific, grow about 3½ feet high, and have not increased in height since the first planting. Of the many varieties of "Extra Early's," annually advertised, I have tried several sorts in order to get an earlier kind, but all my trials have proved failures. The Dan, O'Rourke came the nearest, but they were at least three days behind, and less prolific."

THE SEBEC POTATO.—DOCT. B. H. STEVENS, Essex, Conn., writes: "Last spring I sent to Maine and got a quantity of the Early Sebec potatoes, and found them large and handsome. I planted as directed, putting only two eyes in a hill; I think I could not have used more than 3 barrels to the acre. They started early and grew well. There were vines enough, and I sometimes thought that cutting to one eye would have done as well. They were fit to dig 10th to 15th July, (that was early with us last season). I had from one acre 300 bushels of large, smooth, handsome potatoes. I planted the Early Goodrich in the same way, and the yield was about the same; it is not as early, not as good eating, not as fine, and with more small ones. The Sebec we think with us the best early potato that grows. It resembles the Mercer, and it has the same pink streak running through it when cut. I cannot speak too highly of the Sebec. It did nobly with us last season, and gave us a large yield, while almost all other kinds failed." This variety, which is quite popular "Down East," is not as generally known as its merits deserve. It was figured in our Horticultural Annual for 1867, where it is highly commended by Mr. Burr and Mr. Gregory. Mr. G. says that the Sebec will admit of being dug earlier in proportion to the maturity it has attained than will the Early Goodrich, and is excellent and prolific.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

The Game of Croquet.

These sunny days and the springing grass remind us pleasantly of the mallets and hoops that were laid aside only with the late frosts. The popularity of croquet (pronounced *cro-kay*) is not difficult to account for. It is one of the few outdoor games which both sexes can share. The implements used in the pastime are simple and cheap, the field for its enjoyment is the yard or lawn adjoining the home, the exercise is gentle, and facilitates rather than hinders conversation. It is always at hand—a pleasant relaxation for young and old. It is best known in cities and villages. Many think it deserves a wider range in the country, where the people work quite as hard, and need quite as much a cheerful recreation. All the materials of the game can be got up by any skillful boy who can use a lathe and handle a brush.

The *Mallet* seen in the hands of the player, fig. 1, requires a thin, round handle about three feet in length; the head say 5 inches long, and $2\frac{1}{2}$ inches in diameter—smaller in the middle than at the ends. The bottom of the handles should be painted with different colors to correspond with one of the balls. It takes eight of these mallets to play a full game.

The *Balls* are also eight in number, and should be painted with a single stripe, or all over, of the following colors: blue, pink, black, yellow, brown, orange, green, red. They should be about eight inches in circumference, perfectly round, and should be made of hard wood, maple, cherry, oak, ash, or walnut.

The *Hoops*, ten in number, are made of iron, about 16 inches high and twelve wide, and painted white, for convenience in seeing, if the game should be prolonged into the twilight, as sometimes happens. Wire $\frac{3}{8}$ of an inch in diameter will answer a good purpose. Rods of wood might be used, but they are not as durable and are not recommended.

The *Posts*, two in number, should be about 24 inches high, and sharpened for driving into the ground. The upper end is marked with 8 divisions,

as seen in fig. 2, by painting in colors to correspond with the balls. This arrangement of colors is to distinguish the two sides in playing, the alternate colors being matched against one another. This arrangement brings the light colored balls on one side, and the dark upon the other. The arena, or spot for playing, is a matter of some importance. Any smooth turf will answer, but it is better to have it graded perfectly level for the purpose, as it gives a much better chance for skillful playing. Make the turf thick by top-dressing and frequent mowing, and it will last much longer. The game begins by choosing sides, the captain of one side taking the blue ball and mallet, and the captain of the other side the pink, and so on in due order. Eight can play, or any smaller number down to two. If only two players can use two balls

each, playing them alternately. The hoops may be arranged in either of three orders, shown in figs. 2, 3, or 4. The playing begins at the spot or foot of the arena, and the object is to drive the balls through all the hoops in the direction indicated by the dotted lines and arrows, and to strike the two posts. The side all of whose members do this first wins the game. To "croquet" is to put your own ball against the one you have hit, and holding it firmly with the foot, strike it with the mallet and send off the ball it touches by the communicated force. As you can "croquet" friend or foe and help or hinder the object in view, this croquet-fig. 3. CROQUET GROUND. ing becomes a very important part of the game.

The captain holding the blue ball places it in any direction, twelve inches from the starting stake, and with a blow tries to drive it through the first hoop. It is his stroke as long as he drives the ball through a hoop. When he fails, the captain on the other side plays, and it is his stroke if he drive his ball through a hoop, or hit his enemy's ball. The hitting is called "roqueting," and gives him the privilege of croqueting, which he does by sending his enemy's ball as far off the track as possible. When he has missed, the other players follow in the order in which the colors are marked upon the post. Until a player has gone through the first hoop, he is not allowed to have an extra turn, if his ball hit that of another. The player who reaches the turning post first has great advantage for a time,

for as soon as he touches it he commences his return journey, and meeting the other players on their road to the farthest part of their journey, he is able to croquet them and considerably impede their progress. When a player has passed through all the hoops he becomes "a rover," and is privileged to rove about all the ground, croqueting his friends and foes. A good player, when thus situated, can prove of immense advantage to his side, and should on no account hit the starting or winning post until all on his side have passed through the last hoop. The game grows most exciting as the last pair approach the winning post, when one by a dexterous stroke hits it and wins the game.

Barrel Croquet is played upon a board made for the purpose, with the same arrangement of hoops and posts as shown in the diagrams. The mallets, balls, and hoops, of course, have to be much smaller, and the croqueting must be done by placing the forefinger, instead of the foot, upon the ball. The best boards have a rim to them with a steel wire stretched parallel to the sides and ends, against which the balls strike and rebound. This gives opportunity for much more skill in the game.

The rules of the game are quite numerous, and differ somewhat in different localities. We have indicated the essential principles and course of the game, and any rules may be adopted that the players can agree upon. They are soon learned from a skillful player, or from little manuals that are sold with the materials of the game—often separately.

A Convenient Cooking Table.

Mrs. M. S. W. sends the following account of a contrivance which she has found very convenient in the kitchen of an old-fashioned house, where pantries and closets were omitted by the builder:

"Having for several years walked miles each day while doing my cooking and dairy work, and now having the comfort of a cooking table established within eight steps of my cooking stove, I will describe it, hoping some woman of many steps may be induced to supply the need for herself. My cooking table is eight feet long (it should be nine), and is placed in a recess between the chimney and a window, the size of which decided its length. It is two feet seven inches high, and should be two feet three inches wide on top. Below, it is enclosed at the back and ends, and has doors in front. It has no floor, but stands directly upon the floor of the room, and is movable. The enclosed space below is divided into three compartments. The right hand closet contains the flour barrel; a door coming down to the floor opens to admit it, and closes tightly again until the next barrel is needed. Inside, there is space to hang baking pans by their rings on the partitions; over the flour barrel is a lid that is raised whenever flour is to be taken out; the sieve and scoop remain in the barrel. The lid is a part of the surface of the table, and opens over the whole width of the flour compartment. Above the door of the middle closet there is a drawer without back or sides, which is the bread board. When drawn out and turned around, the front becomes a back, and is very useful in preventing the scattering of flour in rolling pastry, etc.; when returned to its place the roller can remain upon the board. Below this drawer is a closet with a door, and a shelf large enough for a pan of milk, or bowls and pudding dishes; below the shelf is space for a bucket of sugar, jar of lard or cream, and molasses jug.

The left hand closet has at top a drawer divided into two compartments, one for eggs, the other for spices, yeast powders, nutmeg grater, cake cutter, etc.; a shelf below holds boxes of saleratus, a bag of salt, boxes of rice or tapioca, jug of syrup, jars of preserves while in use, etc., or is an excellent place to keep pies. I can assure any woman who has not better conveniences that it is a great saving of time in cooking to have all these within reach of her hand, without stepping from her place. The table, including its surface, being about an inch and a half higher than a flour barrel, a short woman cannot roll pastry or mould bread easily without something to stand upon. I have a narrow piece of board about two feet long, with two pieces of inch board nailed across its underside. This is one of the best conveniences of all, for on a cold morning when I have biscuit to bake, I warm my wooden cricket by the fire, and it saves me from any uncomfortable chilliness, and as the closet door swings over it, is not in the way. The table may be of pine, and stained or not in front, or of black walnut. There should be a narrow strip of wood nailed upon the back of the surface of the table, and one across between the principal part of the table and the flour division, to keep water from flowing over the back or into the division containing flour, when washing the table after cooking."

Household Ornaments—Pen Wiper.

Miss Lizzie Holmes, of Des Moines Co., Iowa, sends us the following sketch and description. (The engraver has magnified the leaf-veins to an unnatural size, in order to show the stitches. The engraving is a little more than one-third the size of the article itself.) "A very pretty *Pen Wiper* may be made as follows: Cut two pieces of black, gray, or brown cloth, the shape of the above pattern. Work the veins on one leaf with green silk or worsted, in chain or herring-bone stitch, and on the

other with red. Then cut two pieces of black silk of the same shape, and baste on the under side of each leaf as a lining; finish the edge of each in button-hole stitch with worsted or beads. Cut half a dozen leaves of some soft, black material, and lay between the two covers, fastening at the stem with a bow of narrow ribbon, or covered wire."

Variety at the Table—Two "Bills of Fare."

Variety is said to be the spice of life. Our good housewives seem to believe the adage, so far as it respects food, for what one of them is there who is not *always* worrying herself over the question, "what shall I get for breakfast, or dinner, for a variety?" Some time since we referred to the experience of a lady who kept three cards on which she had written down, 1st, The names of articles always at hand, and good for breakfast at all seasons; 2d, Those not so common or not always to be desired. The other two cards, one for noon, and the other for evening, contained similar lists for those meals. She stated that it was often a relief or help to run her eye over the cards, and select what she would have, without delay. . . . Mrs. A. M. HOFFMAN sends to the *American Agriculturist* the following programme, or bill of fare, for a week's meals during two seasons of the year, which we print as suggestive. Such a variety can only be provided at the tables of well-to-do families, and with plenty of room and help, but every housekeeper can change and modify it to suit her own circumstances.

For Spring.

MONDAY.—*Breakfast:* Mincéd veal, omelette, fried potatoes, milk toast, coffee.—*Dinner:* Roast mutton, potatoes, salsify, horseradish, custards.—*Tea:* Dried beef, biscuits, canned fruit, Sally cake. [As Monday is "washing day," would not the variety proposed for breakfast occupy the whole stove or range, to the exclusion of the boiler, which should be early at work heating water? And would not the preparation occupy too much time of the help, if the cook also does the washing?—Ed.]

TUESDAY.—*Breakfast:* Ham and eggs, potatoes warmed in cream, Indian cakes, maple syrup.—*Dinner:* Veal pie, boiled potatoes, spinach, fried parsnips, baked butter pudding, with sauce of butter and sugar stirred to a cream, flavored to suit the taste.—*Tea:* Waffles, maple syrup, or maple sugar shaved fine.

WEDNESDAY.—*Breakfast:* Dried beef cooked with eggs and cream, baked potatoes, muffins, coffee.—*Dinner:* Beef soup, baked fish, vinegar sauce, potatoes mashed, fried parsnips, horseradish, Marlborough pie.—*Tea:* Caramel cherries, egg puff, New England ginger-bread.

THURSDAY.—*Breakfast:* Fried liver, fried potatoes, scrambled eggs, mush of Graham flour, eaten with syrup or cream and sugar.—*Dinner:* Beef pie of Wednesday's soup-meat, spinach, asparagus, boiled potatoes, roly-poly pudding.—*Tea:* Boiled custards, stewed or canned raspberries, Graham bread, sponge cake.

FRIDAY.—*Breakfast:* Veal cutlet, fried potatoes, horseradish, cressets, corn bread, coffee.—*Dinner:* Boiled codfish, egg sauce, mashed potatoes, fried parsnips, salsify, bread pudding.—*Tea:* Biscuits, currants canned or stewed, radishes, soft jumbles.

SATURDAY.—*Breakfast:* Codfish balls, poached eggs, toast, coffee.—*Dinner:* Pea soup, boiled pork or ham with greens, kale, horseradish, mustard, rhubarb pie.—*Tea:* Fresh frye and Indian bread, pot cheese, cressets, dried apple sauce, cookies.

SUNDAY.—*Breakfast:* Bread and butter, boiled eggs, pepper-grass or cressets, coffee.—*Dinner:* Veal stuffed and baked, mashed potatoes, lettuce, asparagus, spinach, pickled plums, lemon pie, coconut pie.—*Tea:* Biscuits, warm maple sugar, cold veal, radishes, Queen's cake. Stewed fruits are always suitable for spring breakfasts.

For Summer.

MONDAY.—*Breakfast:* Broiled mackerel, fried potatoes, cucumbers, bread and butter, coffee.—*Dinner:* Cold ham, boiled potatoes, string beans, lettuce, mince pudding.—*Tea:* Stewed gooseberries, bread and butter, radishes, pot-cherries, soft jumbles.

TUESDAY.—*Breakfast:* Fried liver, fried mush, new potatoes warmed with cream, young onions, coffee.—*Dinner:* Broiled veal, mashed potatoes, summer squash, fried egg plant, peas, lettuce, cherry pudding.—*Tea:* Strawberry short-cake, strawberries and cream, and plenty of strawberries.

WEDNESDAY.—*Breakfast:* Griddle-cakes, omelette, fried potatoes, pepper-grass, currants in sugar, chocolate.—*Dinner:* An old fowl, boiled whole, then browned in the oven and chicken soup made from the liquor, lima beans, cucumbers, mashed potatoes, raspberry pie.—*Tea:*

Fresh bread, radishes, blanc-mange and berries, cookies.

THURSDAY.—*Breakfast:* Fish broiled or fried, baked potatoes, hominy balls, cucumbers, horseradish, mush made of "grits" or cracked wheat.—*Dinner:* Roast lamb with mint sauce, peas, egg plant, stewed tomatoes, new potatoes cooked with cream, muskmelons.—*Tea:* Blackberries, bread and milk, huckleberry cake.

FRIDAY.—*Breakfast:* Cold lamb warmed up in gravy, fried potatoes, sliced tomatoes and onions, coffee.—*Dinner:* Boiled beefsteak pudding, beans, early cabbage or cauliflower boiled with cream, stewed tomatoes, boiled green corn, potatoes, boiled blackberry pudding, suet crust.—*Tea:* Stewed plums, biscuits and butter, cup cake, tea.

SATURDAY.—*Breakfast:* Mock-oysters or green corn cakes, fried potatoes, cucumbers, radishes, hot rolls, coffee.—*Dinner:* Vegetable soup of beef, Irish stew of the soup-meat, fried potatoes, French turnips with cream, green apple pie.—*Tea:* Rasks, cheese, blackberries, baked sweet apples.

SUNDAY.—*Breakfast:* Mincéd codfish with hard boiled eggs, potatoes in cream, corn bread, coffee.—*Dinner:* Roast pig, cold, currant jelly, stewed apples, succotash, hot slush, boiled onions, potatoes, watermelons, plums and peaches, raspberry shrub.—*Tea:* Biscuits, peaches and cream, fruit cake, jelly cake, lemonade instead of tea (the day being very hot).

Hulled Corn.

The old-fashioned hulled corn is prepared as follows: To make lye enough for three quarts of corn, take about 4 quarts of ashes and boil them an hour in about 8 quarts of water. Hard wood ashes are best. After the ashes have settled, turn off the lye, which will be about six quarts. Put the corn into the lye and boil three hours, or until the hulls begin to come off freely. Then take out the corn, put it into cold water and boil again. Keep boiling and changing the water until it is perfectly clear, rubbing the corn with the hands as the water is poured off, to clean off the hulls. The water will need to be changed a half dozen times or more. This will remove all the lye and make the corn white and soft. It is now ready for use and will keep in cold weather several weeks. It is fried with salt pork gravy and makes a nice dish. It is also warmed up and eaten with milk, or like hominy, with syrup. The white dent corn of the South is the best for this purpose. Potash lye is sometimes used, but does not leave the corn so white.

To Clean Tripe.

"X. Y. Z." America, N. Y., writes as follows: Take the pouch out on clean straw, empty with care, turning it inside out. Rinse thoroughly; cut in convenient pieces; have ready a kettle containing 3 or 4 gallons of hot, but not boiling water, with a tablespoonful of slaked lime to each gallon. Seal one piece at a time, lay it on a smooth board or table, and with a smooth-edged knife scrape the inside perfectly clean. Wipe off the board or table before sealing another piece, and be careful to keep the scalding water at the right temperature. Soak in cold water a few days, changing the water daily, until the tripe is clean. To make the best possible use of the tripe, take coarse pieces of beef, both fat and lean, from the flank, shoulder, and neck. Cut into pieces of not more than one inch in thickness, season lightly with salt and pepper, and sew it up in pieces of tripe with a coarse needle and strong thread; have the balls of meat, when sown up, moderately compact and of about five inches diameter more or less, round, oval, or any other shape. Boil until they can be easily pierced with a straw. Put them into a tub, or stone-wear pot, and add vinegar, and they will keep a long time. When wanted, cut in slices $\frac{1}{2}$ inch thick, and fry in some of the gravy that boiled out, to a delicate brown; serve with fried apples.

A "Tidy."—The following directions make a simple and elegant one. Take a piece of thin muslin, ten inches square; in the center draw any design you choose—a palm leaf or other simple figure—and work it in chain stitch with scarlet wool; turn down the edge, as if for a hem, and work

around in button-hole stitch with the same wool; finish with a ruffle (not too full) an inch and a half wide. The ruffle should be futed. Double zephyr is the most suitable wool to use, and a half ounce will be a great abundance for an ordinary tidy.

Rusting Metals Prevented.—Lard or any kind of grease entirely free from salt will shut out air and moisture, both of which are essential to oxidation or rusting. A little resin (common "rosin") melted with lard, makes the best coating for all kinds of iron and steel surfaces. It can be rubbed on table knives and forks, and other fine instruments, and then mostly wiped off, still leaving enough to protect the surface. The resin prevents rancidity of the lard, and is itself a protection. This mixture is cheap, and good for plow-shares, and all farm or mechanical implements of iron or steel. Two or three ounces, or more, of resin may be added to a pound of lard.

How to Take Care of a Watch.

By R. L. H., Ind. Delicate time-keepers would not get out of repair so often, and would last much longer, if the following rules were observed. 1. While winding, hold the watch perfectly still. 2. Have a key that fits closely to the winding post, so that there can be no slipping. 3. Have it cleaned once in a year or 18 months, to save friction. 4. Never trust it to a poor workman. 5. In regulating it, always compare it with the same time-piece, one that can be relied on, and if it does not gain or lose more than half a minute a day, do not touch the regulator at all. 6. Open it only when necessary, as small particles of dust will get in and injure it. 7. If it stops, do not try to remove the obstacle, but take it to an approved watch-maker. Many valuable watches are annually spoiled by careless handling and tinkering.

Ice Cream Cake.—1 cup sugar, 2 cups flour, $\frac{1}{2}$ cup milk, 3 eggs, (beat the whites separately), $\frac{1}{2}$ cup butter, 1 teaspoonful cream of tartar, $\frac{1}{2}$ teaspoonful soda. Flavor with vanilla. Appropriately named.—*Miss Libbie Leffingwell, Rome, N. Y.*

Apple Meringues. (Pronounced "me-ri-je.")—Pare 6 pleasant apples, core in halves; put in a dish, with the juice of one lemon. Stew in the oven until tender, and cover with the whites of 3 eggs beaten to a stiff froth, with $\frac{1}{2}$ cup of sugar. Brown in the oven. To be eaten with boiled custard made of the yolks.—*Miss Leffingwell.*

The following are contributed by Mrs. D. W. Sutton, of Westchester County, New York.

Jelly Cake.—One cup of sugar, 1 cup of flour, 3 eggs, $\frac{1}{2}$ cup of cream, $\frac{1}{2}$ teaspoonful soda.

Farmers' Fruit Cake.—Chop and soak 3 cups of dried apples over night; simmer 2 hours in 2 cups of molasses, add 2 eggs, 1 cup sugar, 1 cup milk, $\frac{3}{4}$ cup butter, heaping teaspoonful of soda; make a rather thick batter, and bake in a quick oven.

Drop Cake.—Six cups of flour, 3 cups sugar, 2 cups butter, 1 cup milk, 3 to 5 eggs; flavor with nutmeg; drop on tins and bake.

Frothy Cream and No Butter.—Mrs. S. writes: "We have churned here for twelve hours without getting butter or having any sign of it. The cream indicated over sixty-four by the thermometer, it foamed, and we applied warm water; but it did no good, the more we churned the worse it got. We would like a remedy." Cream once frozen is very likely to froth when churned, especially if churned too warm. In this case we have little doubt the cream was too warm—"over 64"—is rather indefinite, and too hot at any rate. The butter probably came and was whipped into froth without gathering at all. Warm water and more churning only made it worse, of course. Much cold water would have chilled it so that it would have gathered in small granular masses, not much bigger than mustard seed, and so it would have long remained. A small quantity of cold water added every few minutes while churning would probably have caused the butter to gather uniformly by the time the temperature reached 62°, or soon after; but it would probably have been without color or fine flavor. Standing till cooled down to about 60° would probably have produced a similar effect, and perhaps more easily,

BOYS & GIRLS' COLUMNS.

A Wonderful Musical Instrument.

A gentleman in this city recently exhibited the powers of a musical instrument remarkable for its construction and for the almost endless variety of tones produced with it. All the ordinary notes, as heard in conversation or in singing, the cries of different animals, the songs of birds, of many different wind and stringed instruments, were brought out with clearness, and the volume of sound could be increased so as to be heard a quarter of a mile, or in an instant reduced to the gentle sound made by the rustle of a falling leaf. It consisted of a simple tube made of several pieces joined together so that the parts were easily moved by hands and strings attached. Inside the tube were two small, thin slips which vibrated easily, after the manner of a reed in a cabinet organ. The tube was attached to a moderate-sized pair of bellows, so constructed that a small or large quantity of air could be forced from them at the will of the operator. From an examination of the instrument no one would suspect that its power of expression could be so varied. A most interesting part of the performance was where the different feelings and passions of the mind were expressed by the modulations of sound. Anger, fear, hope, joy, love, and even the more delicate shades of feeling, such as distrust, bashfulness, and vanity, were clearly represented. Fortunately for the enjoyment of the public the instrument is not patented, the inventor having left it open for free use by the public. We understand that several hundreds have already been brought into use in different parts of the country. Any one desiring to know more about it should take pains to cultivate his voice, and he will discover that this wonderful instrument is situated in his own throat. If properly used it will do all we have said, and much more. We think it should be considered all the more valuable because it is so very common.

No. 302. Labyrinth.—Find your way from the entrance to the Fish Pond without crossing a line.

portion as should please them, having full confidence in their friendship. When the time came, the greedy executors assigned him one-tenth of the estate, and kept the rest. The young man, being naturally dissatisfied, brought suit against them, a trial was had, and the judge decided that he should have the nine-tenths, and the executors the one-tenth, on the ground that they had shown by their conduct that the nine-tenths pleased them.

What Is a Month?

"Four weeks," answers a boy just from school, who has been learning the "Tables" in his Arithmetic. "Thirty days," says a clerk, who has been reckoning interest on a note. "The twelfth part of a year," suggests some thoughtful scholar, after thinking of the matter a moment. Neither answer is entirely correct. February is the only month consisting of four weeks, and it has more than that in leap year; the other months have either 30 or 31 days, neither of which is the twelfth part of a year. The word "month" was formed from the Saxon word *mona* (the moon). Formerly a month meant the time of one revolution of the moon around the earth, equal to 29 days, 12 hours, 44 minutes, and 3 seconds. Ten such months were counted a year in the time of Romulus, King of Rome. March was reckoned as the first month. The names of the nine following ones were the same as now, excepting July and August, which were called Quintilis and Sextilis. It was found before long that the seasons did not keep pace with the year; March did not bring spring again, and the following seasons were equally tardy. To remedy this, the Emperor Numa added two months, January to the beginning, and February to the end of the year. This was afterward changed, and February placed where it now stands, the second month. At that time the months contained 29 and 30 days alternately, which would give 354 days, to which one was added to make an odd number, which was supposed to be more lucky. Still, the seasons would not come regularly at the same time of the year, because their changes are produced by the earth's revolution about the sun, which requires 365 1/4 days very nearly, and the year should therefore be of this length, to have the same month bring the same kind of weather every year. It was therefore ordered that another month, of 22 and 23 days alternately, should be inserted every second year between the 23rd and 24th of February. This would have answered the purpose for a long period of years, but the ruling powers occasionally interfered with it, to prolong or shorten the time of holding office. At last the Emperor or Cæsar decreed that the year should contain 365 days, with one day added every fourth year. He also decreed that the odd months, that is, the first, third, etc., should have 31 days, the others 30, excepting February, which should have 28, with one added every fourth year. The names Quintilis and Sextilis were changed to July and August, in honor of the Roman emperors Julius Cæsar, and Cæsar Augustus. The latter emperor also decreed that August should have 31 days, as he was not willing to have July contain more than the month named after himself. This arrangement has continued until the present time, excepting that in 1582 it was decreed by Pope Gregory XIII, that the added day for leap year should be

omitted in years ending in centuries, excepting the 400th and the years which are multiples of 400; this makes the civil year correspond almost exactly with the solar year, and the four seasons continue to occur with regularity during the same months of each year.

Comical Action Puzzle.

This is best performed in a company of a dozen or more, but will give amusement wherever tried. Let all be seated around a table. At a signal from the leader, the following three motions are to be made: first, strike with both hands, palms downward, upon the table; second, clap the hands together; third, with the right hand take hold of the nose, and with the left hand seize the right ear. These motions are to be made quickly, and it will usually cause a hearty laugh to see what directions the puzzled hands will take. After a little practice has made it easy, reverse the hands, seizing the nose with the left hand, and the left ear with the right hand.

No. 303. Illustrated Riddle.—A truth to be remembered.

Answers to Problems and Puzzles.

The following are answers to the puzzles in the March number, page 107. No. 299. Shadow (*shad oh*)... No. 301. Seal; seas; east (a point of the compass)... No. 304. All's well that ends well... The following have sent correct answers to some of the puzzles previously published. Arthur T. Butler, Walker Adams, C. Langdon, George N. Buel, C. A. McGartney, Thos. J. Lannon, Frank T. Robinson, W. Anderson, Elmer S. Dodge, Eli. Mrs. G. K. Barker, D. Van Baren, R. G. W. English, Linlie Lathrop, W. J. Brown, Daisy Wilder, Joseph Sheets, J. Milton Snyder, Columbus Snyder, George C. Pontz, Francis F. Bullock, Robert E. Moody, L. M. Wright, Nehemiah N. H., Wm. Reynolds, Frank A. White, Henry E. Nelson.

A Queer Fish.

Such a collection of *sway* follows as is here represented can rarely be found. We have not counted the number of faces which can be made out by examination of this singular specimen; whichever way it is turned, new combinations and new features appear. It is the ingenious work of one of our artists. Perhaps he had eaten too heartily of fish for supper, and this nightmare apparition impressed his fancy. How many human faces can you find?

Puzzle for the Eye.

Look carefully at the straight lines that run lengthwise across the engraving, and try to judge how much more widely apart they are at one end than at the other. Probably not one person in ten will make a correct estimate on the first examination. After having measured the distances with the eye, apply a rule or other measure, and the result will probably cause some surprise.

Avarice Outwitted.

The following case is reported as having been decided in one of the courts of law. A wealthy man died leaving the singular will that his executors should have the use of his property until his son, then a young man, should come of age, and that then they should give him such a

[COPYRIGHT SECURED.]

"SIT UP, PONTO!" — Engraved for the American Agriculturist.

Which enjoys it most, Ponto or his playfellows? The whip which one of the children carries, had very little to do with the training of their pet; the pleasant looks of all three show that. The picture tells its own story so well that not a word of comment is needed. Several of our young friends have written to ask the best way of training dogs and other animals. We say, use very little whip but much sugar. Dogs are usually fond of sweets, and when once they understand that the performance of any act will bring a treat, they will not be slow to earn it by obedience. The great point is to make them understand what is wanted. Saying a thing over and over many times will not make it clear to an animal—he does not understand the language. He must be shown again and again, just what is required, while repeating the words of command, until in time he will learn to associate the words with the action, and both with the sugar which he loves. It may sometimes be necessary to use the whip *after* he knows his duty, but never to teach with; much kindness and great patience will be needed, and for this reason it is well for children to train pets, because of the good effects which it will be likely to have on themselves.

A Dog Story.

Our young readers have, no doubt, often seen dogs carefully bury a choice bone or piece of meat in some out-of-the-way place. They do this to provide against days when the supplies may run short, or the cook be cross, or some other trouble may interfere with their regular rations. A gentleman at the West relates that his dog had many deposits of this kind, and when any strange car came into the neighborhood, the prudent animal would carefully guard his stores to prevent their being stolen. One day, however, a lean, half-starved specimen came

freely trotting by, when the provident dog ran up to him, soon made his acquaintance, and won his confidence, as dogs know how to do, and then led him to one of his hoards, dug out a good bone, and watched him with great satisfaction while he gnawed it. He then showed him another deposit, which satisfied his appetite, and he went joyfully on his way. This is a pretty tough dog story, but is vouched for by the gentleman who relates it.

About Wearing Jewelry.

Jewelry of some description has been worn in every age from the earliest times and by all classes. The Israelites in the wilderness gave freely of the ornaments which they had borrowed of the Egyptians, to aid in making the sacred utensils of the Tabernacle. Earlier than this, Rebekah received presents of jewelry from her suitor, Isaac. The most savage tribes manufacture these articles for personal adornment from shells, stones, or wood, hanging them from their necks, around their arms and fingers, or thrusting them through their ears, noses, or lips; and in the highest civilization the pageantry of kings is not thought complete without the costly and flashing jewels which adorn the crown or decorate the person of the monarch. The passion for this kind of ornament was, perhaps, never more prevalent than at the present time, and in this country. Immense factories with thousands of workmen are employed in supplying the demand for rings, pins, bracelets, necklaces, etc., etc. The swindling fraternity have reaped a rich harvest by gift enterprises, lotteries, and other schemes, in which glittering jewelry formed the cheap but attractive bait. Now we do not think it sinful to wear ornaments. It is right to make one's self look beautiful. It gives pleasure to all to see handsome features and to see them properly

adorned. But the point is that jewelry does not usually add to good looks. If one is fair by nature, then glittering gold and shining gems attract attention away from the person; if homely, then the features are made still uglier by contrast. Besides this, beauty in man or woman consists in something more than mere shape of the features. The expression, showing the spirit dwelling within, is the true test of beauty. Passion, hypocrisy, meanness, cowardice, slyness, vanity, or any disfigurement of the soul, will mar the comeliest features. A display of outward ornament usually heightens the expression of the vanity which might otherwise escape notice, and thus defeats the object it was intended to secure. A simple, unostentatious pin or ring, the gift of friendship, may indicate affectionate remembrance, and thus be truly ornamental. The rule may be laid down that what is worn merely because it is showy always detracts from good looks in the estimation of a person of true taste.

Comical Command.—A gentleman in this city, well known for his irrepressible comicallities and his warm love of children, was once disturbed by the necessities of his little daughter while reading the Bible at family devotions. Closing the book and looking severely at the offender he said to her very sternly, "Mary, sit down in that corner, and don't you dare to wink loud!"

CHILDREN'S TALK sometimes contains amusing mistakes. A friend recently overheard the following in the street. A little girl was playing with a very small dog, and calling the attention of one of her playmates to the diminutive size of the animal. The reply from the four-year-old was: "My sister's got a good deal little *dogger* than that." The meaning was plainer than the language.

**COLLINS & CO.'S
CELEBRATED SOLID CAST STEEL PLOWS.**

These plows are made of a superior quality of Cast Steel, recast in molds into the exact shape required for the mold-boards and other parts. These parts are then highly tempered, ground and polished. Every plow is warranted to "scour" in the most sticky soils. Any section can at any time be replaced by a duplicate or if the share is worn, it is easily repaired by *rescuing on a new steel point*. Consumers who have tried *Collins & Co.'s* Plows, will readily perceive the superiority of the Cast Steel Plow. Circulars giving full particulars sent upon application to

COLLINS & CO.,

No. 212 WATER STREET, NEW YORK CITY.

American Waltham Watches.

THE BEST! THE CHEAPEST!

Recommended by Railroad Conductors, Engineers, and Expressmen, as superior to all others for steadiness, strength, accuracy, and durability.

Unscrupulous Dealers occasionally sell a worthless Swiss imitation. To avoid imposition, buyers should always demand a certificate of genuineness.

For sale by all respectable dealers.

Ask for a Waltham Watch, and take no other.

IT IS THE BEST. IT IS THE CHEAPEST.

B. K. BLISS & SON,

Importers and Growers of Garden, Field, and Flower Seeds, and Dealers in Horticultural Implements, Fertilizers, Garden Requisites, &c., &c.

The attention of all who are interested in the culture of **Flowers and Vegetables** is invited to our large and well selected assortment of the above, comprising the newest and most approved varieties both of European and Home production, the quality of which cannot be surpassed. For a list of which see our

New Illustrated Seed Catalogue and Amateurs' Guide to the Flower and Kitchen Garden.

The **Fourteenth Annual Edition**, enlarged and improved, contains 132 pages of closely printed matter. Beautifully illustrated with upwards of **One Hundred Engravings**, and a descriptive list of **Twenty-five Hundred varieties of Garden, Field, and Flower Seeds**, including all the leading novelties, with explicit directions for their culture; also a list of

One Hundred and Fifty Choice varieties of French Hybrid Gladioli.

Embracing many new sorts not before offered in this country—with many other **Summer Flowering Bulbs**, consisting of **Amaryllis, Tuberoses, Tigrids, Lilies, etc.** To which is added a list of the most desirable varieties of **Small Fruits, Bedding Plants**, and much other useful information upon the subject of gardening generally. A copy will be mailed to all applicants upon receipt of **25 Cents**.

Our **New Illustrated Plant Catalogue** will be published early in March, and will contain a list of many **New and Rare Plants**; also a descriptive list of all the leading varieties of **Dahlias, Verbenas, Canas, Geraniums**, and other **Bedding Plants**. Price 10 cents. A copy of each will be mailed to our Regular Customers without charge.

We would invite particular attention to the following **Collections of Seeds**, as well as to the **special varieties** enumerated, the purity and vitality of which cannot be excelled, all of which, with the exception of those noted, will be **mailed postpaid to any address in the Union**, (excepting those upon the Overseas Mail Route), upon receipt of price affixed.

Collections of Flower Seeds by Mail.

The following collections have been sent out from our establishment for the past 14 years, and are now favorably known in every country. They contain the most showy varieties in our large assortment, with full directions for culture. Each packet contains a mixture of the different colors and varieties of its species, so that a greater display can be made at a much less price than when ordered in separate packets. Those unacquainted with Flowers, as well as the experienced cultivator, may order without fear of disappointment.

No. 1—contains twenty choice varieties of Annuals, \$1.00
No. 2—contains twenty choice varieties of Biennials, \$1.00
No. 3—contains ten extra varieties of Annuals and perennials, embracing many of the new and choicest in cultivation, \$1.00
No. 4—contains five very choice varieties, selected from Prize Flowers, of English Pansies, German Carnation and Picotee Pinks, Verbenas, Trifurcata, French Aspers, Double Hollyhocks, \$1.00

Any one remitting \$3.00 will receive the four assortments, postage free.

No. 5—contains fifteen very select varieties of Green-house seeds, \$3.00
No. 6—contains one hundred varieties of Annuals, Biennials and Perennials, including many new and choice varieties, \$5.00
No. 7—contains fifty varieties of Annuals, Biennials and Perennials, \$2.50
No. 8—contains twenty varieties of hardy Annuals, Biennials and Perennials, for sowing in Autumn, \$1.00

The seeds contained in the above assortments are of our own selection. Purchasers who prefer to make their selection from the Catalogue will be entitled to a discount proportionate to the quantity ordered.

GIANT ASPARAGUS ROOTS BY MAIL.

Extra, strong, one year old Roots, carefully packed, and mailed, post paid, at \$1.25 per 100; \$3.00 for 50; \$10.00 per 1,000.

We earnestly request our correspondents to give their Name, Post-office Address, County and State, distinctly written in full. All orders should be addressed either to

Collections of Kitchen Garden Seeds.

A COMPLETE ASSORTMENT OF VEGETABLE SEEDS FOR ONE YEAR'S SUPPLY, FOR A LARGE OR SMALL GARDEN.

Assortment No. 5, contains 55 varieties, \$3.50
" No. 6, contains 35 varieties, 2.00
" No. 7, contains 15 varieties, 1.00

The above are prepared and packed for sending by mail, and will be sent post-paid, upon receipt of prices annexed.

Larger Collections, which can be safely sent by express (freight paid by purchaser, 10c. on any part of the country), as follows:

No. 1, \$3.00; No. 2, \$15.00; No. 3, \$10.00; No. 4, \$5.00

For a list of the contents of each Collection, see Catalogue, pages 49 and 100.

Bliss' Improved Long Orange Carrot.

This variety originated in Massachusetts several years since, and it is rapidly gaining favor wherever known, and is now almost the only variety grown by farmers in this section. It resembles the "Long Orange" in shape, but is superior to it in every respect, being larger, better flavored, of a deeper orange color, and more sure to produce a crop. Post paid by mail as follows: 1 oz. 50 cts.; 4 ozs., \$1.00; 8 ozs., \$1.50; one pound, \$2.

Connecticut Seed Leaf Tobacco.

Be Sure and Get the Best.

A superior lot raised by special contract with one of the most successful cultivators in the Valley of the Connecticut. Packets with full directions for culture during and packing. Post paid by mail as follows: 1 oz. 50 cts.; 4 ozs., \$1.00; one pound, \$2.00.

B. K. BLISS & SON, P. O. Box 5712, N. Y.; Or. Draw No. 11, Springfield, Mass.

See our Advertisement in March No. of Agriculturalist; or send for Illustrated Priced Catalogue, Sent Free.

Address L. D. SCOTT & CO., Huron, Ohio.

THE NEW DOUBLE PETUNIA "EDWARD BECH."

FROST & CO., Rochester, N. Y., offer this magnificent Petunia to the public for the first time.

This variety we consider the handsomest and largest ever offered, and is so considered by all who have seen it. It is a fine acquisition to the flower garden, and none should be without it.

Price, \$1 per Plant; \$9 per Dozen.

Colored lithographs of the above plant will be sent to all applicants on receipt of 25 cts. for each, and to purchasers of one dozen plants one plate gratis.

Address FROST & CO., Genesee Valley Nurseries, Rochester, N. Y.

Choice Seeds from Rhode Island.

Barrett's Early Cabbage, as good as Brunswick, price 25 cts. per package, \$1 per oz. Brunswick, raised by John Fowler, \$1 per oz. Jersey Wakefield 50 cts. per oz. \$5 per lb. Green Saxony 20 cts. per oz. \$1 per lb. White French Turnip, the purest in the country, \$1 per lb. Red and Yellow Onion. Blood Turnip Red, Early White Dutch Turnip, Late Round Turnip, Horn and Orange Carrot, Autumn Sweet Corn, Early Narragansett Sweet Corn, and various other seeds of our own growing, for which we were awarded the first premium at the New England Fair the past season. All Seeds warranted. Send orders to W. E. BARRETT & CO., Providence, R. I.

Pure Sorgo Seed, warranted. Highland Garden Cultivator, warranted, raised by the labor of four men. Send for Circular, BLYMYER, NORTON & CO., Cincinnati, O.

Lilium Auratum.

New Golden Rayed Japan Lily At Greatly Reduced Prices.

We are happy to inform our friends that we have received a large consignment of this magnificent Lily, only sixty days from Japan—in splendid condition, which we can offer at greatly reduced prices. This species is reputed to be the most beautiful of all the Asiatic Lilies, its wonderful proportions and peerless symmetry of bloom surpass all accounts given by travelers—and plants exhibited since its introduction into this country have more than realized the great anticipations of its wonderful features. The individual blossoms are from eight to ten inches in diameter, of delicious fragrance, ground color of pearly white, which is often suffused with a golden tint, and elegantly streaked over with spots of rich chocolate crimson, with a golden ray or stripe running through the center of each petal. It is perfectly hardy, besides being admirably adapted for pot culture. Strong Flowering Bulbs, \$1.50 each; \$12.00 per dozen. Second size, do., \$1.00; \$8.00 per dozen. The Trade supplied upon liberal terms.

EARLY ROSE POTATOES.

Our stock of this valuable Potato being exhausted, we shall not be able to fill any more orders until the 1st of May. For a list of other popular varieties see our advertisement in March Agriculturalist.

Seeds for Hedges.

Barberry—very hardy, produces a fine, compact hedge—valuable alike for its fruit and security against intrusion from man or beast. 1 oz. 4 cts., 4 ozs., \$1.50, pound, \$5.00. Honey Locust or Three Thorned Acacia. Very hardy, affords ample security against all intruders, well suited for the Prairies. 1 oz., 15 cts., 4 ozs., 55 cts., pound, \$1.00. Osage Orange, 1 oz., 15 cts., 4 ozs., 55 cts., pound, \$1.00.

For a list of the contents of each Collection, see Catalogue, pages 49 and 100.

Pages furnished for 10 cts.

J. KNOX

Box 135, Pittsburgh, Pa.

SQUASHES AND ONIONS.

I have written two very thorough works, one on the cultivation of each of these vegetables, in which the directions given for every step of the process, from selecting soil, preparing, manuring, planting, protecting from insect-weeding, gathering, ripening, storing and marketing the crop, are very minute, that the new beginner can be equally successful with experienced growers. Each work is fully illustrated. Sent to any address, and warranted to reach the purchaser at 25 cts. each. If you prefer them in person, find that he has not got his money's worth, I will refund it gratis. Catalogues of choice vegetable seed, over one hundred varieties, which I myself grow, free to all—no seed warrants. JAMES J. H. GREGORY, Marblehead, Mass.

CROSBY'S EARLY SWEET CORN.

This new variety of corn is early, sweet, and large; unlike most early varieties it has twelve rows and well filled. It is taking the place of all others, giving great satisfaction. Our stock grown from the original. Price per pk. 15 cts. Address, HORTON & CO., Hort 1 Hall, Boston, Mass.

Private Families who aim to raise vegetables of the best quality only, need not be reminded "figs do not grow on thistles," nor that from good seed alone can good vegetables be obtained.

Seeds may indeed grow freely enough, but unless they prove good in every respect, it were better they had not grown at all. The seeds offered by us being mainly the produce of Bloomsdale, raised under our own personal supervision, with the aid of years of practical experience, we are enabled to speak with entire confidence as to their quality, and of the reasonable probability of satisfactory results. We have but few "Nothings" to offer. Our experience (obtained at some cost) is that out of the multitude of that class of vegetables advertised for sale, in most cases the good are not new, and the new are not good!—substantial, staple, well-known sorts are in the main the most reliable.

Purchasers who do not reside within ready access of the city, nor near merchants or druggists who vend seeds, can be supplied by mail, post-paid. Priced Catalogues, for family use, with the F.R.L. REGISTER for 1893 (abundant in useful hints), will be mailed, without charge, to all who apply enclosing a 5-cent stamp.

DAVID LANDRETH & SON,

No. 21 & 23 South Sixth-st.,

PHILADELPHIA.

CHOICE GERMAN FLOWER SEEDS in collections, the finest assortment ever offered. Pre-paid by mail. Catalogues to any address. By the 100 or 1,000 papers to the trade. Trade Lists now ready. R. M. WATSON, Old Colony Nurseries and Seed Establishment, Plymouth, Mass.

 Yellow French..... 1.00..... 10 "
 Improved Rutabaga..... 1.00..... 10 "

Also, apply for Descriptive Catalogue containing directions for the cultivation of Vegetables.

J. M. THORBURN & CO.
 15 John-street, New York.

Early Rose Potatoes.

Perfection Attained at Last.

GEO. W. BEST,

Utica, N. Y.

Has all the Stock which will be offered for sale before Fall of 1868.

The "Early Rose" is a seedling of the "Garnet Chili," originated in 1841 by ALBERT BREZE, Esq., an intelligent farmer, and the whole stock was sold by him to D. S. Heffron, (of Utica, N. Y.), the well-known disseminator of the "Goodrich Seedlings."

In a letter to Messrs. B. K. BISS & SON, of New York, Mr. H. says of the "Early Rose": "It has uniformly ripened ten days earlier than the 'Early Goodrich,' produces less small tubers, is equally healthy, and productive as that justly celebrated variety, and its superior in table quality. It is the best early potato that I have ever grown, such, all things considered." "Skin thin, touch, of a dull bluish color, flesh white, solid and brittle; bolts through quickly; very mealy."

Dr. John P. Gray, Superintendent of the N. Y. State Lunatic Asylum, says:

"Last Spring, (1867), I received from D. S. Heffron a quantity of his new Vermont Seedling Potato called the Early Rose. It was planted the last of May, in alternate rows with the Early Goodrich, in the same kind of soil and treated exactly alike. It came up rank, grew more rapidly than the Early Goodrich, and flowered full two weeks before that variety. It began to ripen its large, thick, growing leaves twelve days in advance of the other, and was fully ripe and fit for digging at least ten days before the Early Goodrich. We carefully measured four rows of each kind across the piece, and found the yield quite equal to the Early Goodrich; in health it was also its equal, while it excels the other in table quality. I consider it the best very early sort with which I am acquainted."

JOHN P. GRAY.

(Dr. Gray has none of the stock for sale, having only raised a few for Mr. Heffron.)

CARD FROM D. S. HEFFRON, Esq.

To Whom it may Concern.

Having recently sold nearly my entire stock of the "Early Rose Potato," to JOHN L. CONOVER and STACY P. CONOVER, they have sent me an order to deliver a portion of them to GEO. W. BEST (of Utica, N. Y.).

D. S. HEFFRON.

GEO. W. BEST has purchased of Messrs. JOHN L. & STACY P. CONOVER, of Monmouth County, New Jersey, a part of their stock of "Early Rose Potatoes," at the enormous price of *Eighty Dollars (\$80 per bushel)*, and proposes to send them out in pound packages, as premiums to those purchasing Grape Vines of him. The following will convince the public that \$80 per bushel is the actual price paid.

City and County of
 of
 New York.

JOHN L. CONOVER and STACY P. CONOVER, of Monmouth Co., New Jersey, being duly sworn, depose and say that on this 21st day of February, 1868, they sold to GEO. W. BEST a part of their stock of "Early Rose Potatoes," at the cash price of \$80 per bushel.

Sworn before me this 21st day of February, 1868.
 A. WILLIAMS GLEASON, Notary Public, New York.

I have a very large stock of Choice Native Grape Vines, consisting of the most desirable varieties, among which are Adirondack, Alliance Hybrid, Concord, Creveling, Delaware, Diana, Union Village, Hartford Prolific, Rogers' Hybrids, Iona, Israella, &c., &c., which I intend to send out in connection with the "Early Rose."

TERMS:

For \$5 (invariably to be sent with the order), I will send Ten Choice Grape Vines from the above list (reserving the right of selection for myself, but will endeavor to suit purchasers as far as possible) and One Pound of "Early Rose Potatoes" all to be securely packed, and sent by mail, postage prepaid.

INSTRUCTIONS FOR PLANTING.

By cutting into single eyes, and planting but one eye in a hill, one bushel may be readily raised from a pound, and will be worth near Fall, at the very lowest calculation, double the price paid for both Vines and Potatoes.

Not more than five packages sent to one address.

No "Early Rose" for sale in quantity at any price, and only in connection with the Vines.

No orders accepted unless accompanied by the Cash.

Orders will be looked in order as received, and Potatoes and Vines shipped as early in the Spring as the weather will permit. Order early, as the stock is limited.

Address

GEO. W. BEST,
 Utica, N. Y.

LANDRETH'S GARDEN SEEDS

Speak their own praise wherever planted.

If the reader of the above wishes to TEST Landreth's Seeds in comparison with the best he has ever used, and cannot conveniently obtain them from merchants or druggists of his neighborhood, a package of 30 papers, judiciously assorted, sufficient for the use of a small family, will be mailed, post-paid, and safe carriage insured, on the remittance of \$3.

DAVID LANDRETH & SONS,

No. 21 & 23 South Sixth-st.,

PHILADELPHIA.

JOHN R. & A. MURDOCH,
 Nurserymen, Florists and Seedsmen,
 No. 112 SMITHFIELD STREET
 PITTSBURGH, PA.,

Opposite the Post-Office.

Are prepared to fill orders for Fruit and Ornamental Trees, Grape-vines, Roses, Evergreens, etc. Vegetable and Flower Seed of best quality. Onion Sets, Early Goodrich, Harrison, and other varieties of Seed Potatoes. Garden Improvements and Greenhouse Plants. We will send by mail, when desired, all orders for seeds to the amount of one dollar or upwards, except Corn, Beans and Peas. Catalogues sent on application and all orders promptly attended to.

A Sixty Pound Cabbage!!

As the original introducer of the *Marblehead Mammoth Cabbage*, I offer the public seed grown by myself from the choicest specimens of the pure stock.

This Cabbage has been grown in nearly every State in the Union, weighing from 35 to 60 lbs. For the past few years it has been the standard variety almost every Agricultural Fair in the United States and Canada, and the public may rely upon my continued care to keep the seed pure from all adulterations and fully up to its previous high standard. This package has a fine engraving of this remarkable Cabbage with very full directions for culture on it. Sent post-paid, with full address for 25 cents per package, five packages for \$1; or 100 packages for \$17.00.

JAMES J. H. GREGORY, Marblehead, Mass.

NEW CABBAGES—NEW SHORT-STEMMED
 Brunswick, or Fottler's Brunswick, New Schweinfurt, Quail, or 100-weight Cabbage, and very early, solid, extra, Clarke's new extra Early Nonpareil, new Schwartz Early Erfurt, each 25 cts., the five for \$1, pre-paid by mail. Extra Early Erfurt Cauliflower, 50 cts. each. Cedar Hill Tomato, 25 cts. With all other new and standard Garden and Flower-seeds, 25 cts. by mail, pre-paid for \$1. Catalogues to any address. Seeds in bulk, under a large and well selected stock of the best variety, at the most judicious selection ever offered in this country. Wholesale Trade Lists now ready, and orders waited for.

B. M. WATSON, Old Colony Nurseries and Seed Establishment, Plymouth, Mass.

Fottler's Improved Brunswick CABBAGE.

This Improved Cabbage is of fine quality, very flat and hard, measuring from one foot to eighteen inches in diameter. We consider it the best variety, either early or late planting; it is easily cultivated, every plant producing a fine head when fully grown. It is highly esteemed by all cultivators, and is used in preference to all others from original stock. Per pkt. 25 cts.

WASHBURN & CO.,
 Hort'l Hall, Boston, Mass.

Boston Market Dwarf Celery.

The very best in cultivation, better very solid, and of compact, dwarf growth. The Boston market gardeners will use no other. Price, 25 cts. per packet, or \$1 per ounce. Also,

IMPROVED BRUNSWICK CABBAGE SEED, of our own growing. This variety was first introduced by our Mr. Schlegel, who, 25 or 30 cents per packet, or \$1 per ounce, by mail. We offer a large and well selected stock of all the leading varieties of seeds. Send for a Catalogue. Write your address plain.

A. SCHLEGEL & CO., 10 South Market-st., Boston, Mass.

Correspondence in English or German. **23**

FARMS. Immense immigration! New settlers more than satisfied: mercury seldom under 50 deg. of zero; people decidedly friendly to new comers. Send stamp for Circular.
MANCIA & CO., Greensboro, Md.

PLANT SORGHUM.

Youngman's Patent Sorghum Evaporator and Refiner removes all of the disagreeable Sorghum Flavor.

IT IS THE ONLY PERFECT EVAPORATOR.
The proprietors of the above Evaporator call the attention of the public to the superior merits of this invention. They claim that it is the best machine for making sorghum syrup and sugar, maple sugar, beet sugar, and other similar products.

It has the following Excellencies, viz.:

Excellencies.—1. It is the cheapest Evaporator ever made, requiring no arch, brick work, or other expensive aid in leaving the mounted traveler's hand. Any person who can afford to buy a lumber wagon, can buy one of these Evaporators.

2. It will do more evaporating, and with less fuel, in a day, than any other Evaporator, with the same capacity of pan.

3. It will make better syrup from sorghum cane juice than any other Evaporator invented, removing, as it does, all of the well-known disagreeable sorghum flavor.

4. It is remarkably easy to manage, as by a well-arranged system of dampers the heat can be graduated, to any degree under the pans, instantly. One man can work the Evaporator—with ease.

5. It is portable, and may be lifted into a wagon by two or three men, without difficulty, and hence can be transported from farm to farm, or from field to field, with the greatest facility.

The foregoing are points of excellence which sorghum growers will appreciate, and in support of them we append the following high testimony.

Testimony.—* * * "The great objection to the use of sorghum syrup has heretofore been its characteristic unpleasant flavor. But this flavor seemed to be entirely removed by your process, and the syrup obtained in taste to the best sugar-house syrup. * * * Letter from Hon. Isaac Newton, Commissioner of Agriculture, dated May 24, 1876.

"Youngman's Evaporator now stands without a successful rival. It has been approved by the highest authorities, and seems to be almost a national blessing. * * * From the finishing pan the syrup flows in a continuous stream, perfectly purified and refined from all milky, mucous, gummy, and objectionable substances, and equal to the best refined syrups. It is about the best possible state for granulation, being entirely freed from glucose. This Evaporator is very light and portable, as it can be easily lifted on a lumber wagon and conveyed from place to place. The capacity of the machine is from eight to ten gallons per hour, and the consumption of wood is no more than an ordinary fire-burner. It is the best of the Improved Farm Implements in the Agricultural Report of the Patent Office for the year 1866.

"From the last pan, called 'the finisher,' the liquid comes out as the most delicious syrup, pure as red-clover honey, and as free from the disagreeable vegetable taste as maple syrup. * * * This machine has every excellent characteristic to recommend it. Every part is most efficient, and one man can make one hundred gallons of syrup in one hour, with a small quantity of fuel. It is compact, will last almost a lifetime with proper care, and can be employed for making maple sugar, or maple syrup, or beet sugar, quite as effectively as it can be used when making sorghum syrup. * * *—Agricultural Editor New York Times, Weekly Edition, Sept. 19, 1876.

"The Committee appointed by the Farmers' Club to examine Youngman's Evaporator desire to report that they went to Baltimore, where they supervised an experiment with the above-named Evaporator; and it affords them satisfaction to report to the American Agriculturist that the efficiency of this new Evaporator exceeded their highest expectation. * * * The Committee were also well pleased with its portability. * * * The small quantity of fuel required to make fifty gallons of syrup is also an economical item. * * * The great simplicity and durability of every part of this device cannot be another source of its great importance in the estimation of the Committee. * * *—Extracts from reports of Committee of Farmers' Club of American Institute to meeting of Club at Baltimore, Md., 1876.

"I planted about three-fourths of an acre of cane, which was manufactured by Youngman's Evaporator. The cane yielded me 125 bushels. The product was 125 gallons of syrup; two loads of fodder, equal to the best timothy hay, and half two loads of sorghum. The quality of the syrup was excellent. The quality of the best syrup is equal to the best syrup of commerce, while the inferior is equal to the best making molasses. * * *—Jesse Jones, Jr., of Jonesboro, Ga.

Success.—Although this Evaporator has just been introduced, it has already taken the first premium at six State fairs, and has been pronounced the best of all other Evaporators wherever exhibited.

Premiums.—During the year 1876, the proprietors of this Evaporator, for the purpose of inducing a widespread trial of its merits, will present to every purchaser the following three articles as premiums: A beautiful Silver-Plated Cake-Basket, Silver-Plated Syrup Cup, and Silver-Plated Butter-Dish. All of these articles are substantially made of either silver or silver-plated metal. The first premium will be sent as soon as the undersigned are informed that the Evaporators have been paid for.

Price.—The price of the Evaporator complete is \$200. It will be sent to any address on receipt of the price. A draft on New York City, or a check on any other bank, or on Baltimore, to the order of the manufacturers, is the best method of payment. Machines will also be sent to addresses, provided the price is paid in advance, and a satisfactory assurance by the undersigned of the responsibility of the parties ordering.

Full and explicit directions sent with each Evaporator. *Syrup made on this Evaporator is worth from twenty-five to fifty cents per gallon more than that made on any other.* For further information or orders, apply to

The results on Corn, Cotton, Tobacco, and Grain, have been astonishing, the past year; maturing crops from 10 days to weeks earlier, and double the crop. Pamphlets with experience of hundreds of farmers, and every information, will be sent free to any one applying by letter or otherwise, to THE LODI MANUFACTURING CO., 60 Courtland-st., New York.

KNOX'S COMPLETE LISTS OF SMALL FRUITS BY MAIL.

RARE OFFERS.

See Page 111, Feb. No. Agriculturist, and order at once.

HARISON POTATOES—superior quality—war-ranted genuine, forwarded by sloop Scudder, Capt. Gorham, to Peck Slip, New York, or to address, on receipt of \$3 per bu. ANDREW W. JENNING, Southampton, Conn.

FISH GUANO.

The cheapest and best fertilizer in use, manufactured and sold by the "Mystic Oil Company," Mystic Bridge, Conn. It is pressed very hard, put up in barrels, and sent to any part of the United States for \$20 per ton, in quantities less than 25 tons. For 25 tons and upwards, \$25 per ton. A dried and fine ground article is sold at \$45 per ton for 10 to 25 tons, \$40 per ton for 25 tons and upward, and for \$50 per ton for less than 10 tons, delivered on board vessel or R. R. at Mystic. An analysis just made of the fine ground by Prof. Johnson, of Yale College, shows that it contains 6.75 per cent. of phosphoric acid, and 16.69 per cent. of ammonia, or about two-thirds the quantity contained in Peruvian guano. Liebig's Baltimore analysis, 10.61 per cent. This indicates a much higher value than the retail price. Admirable for market gardening, grain, cotton, and other crops. Orders may be addressed to W. M. CLIFT, Jr., 56 East 26th-st., N. Y., or D. S. MILLS, Pres't, Mystic Bridge, Conn. They should be sent early as the stock is limited.

FROST & CO.,

GRAPE VINES.

Our Stock of Grape Vines is unsurpassed, if equalled, anywhere, and includes Concord, Hartford Prolific, Creveling, Ives, Reitz, Delaware, Alvey, Rogers' Hybrid, Iona, Israella, Adirondack, Martha, Black Hawk, and all other desirable kinds. We guarantee our prices to be as low as the same quality of a genuine article can be had anywhere, and can furnish Stock of any grade desired.

Persons in want of vines would do well to correspond with us, as we are confident of being able to give satisfaction both in quality and price.

J. KNOX,

Box 155, Pittsburgh, Pa.

F. L. PERRY'S PAT. MAR 27 1885

PERRY'S GRAPE VINES

Are all that can be desired in size and abundance of healthy roots. Prices will be found upon application to be as low or lower than any other offered. Liberal returns offered to those forming Clubs. Correspondence solicited.

Address F. L. PERRY, Chautauque, N. Y.

MAIN GRAPE.

It is claimed for this grape, without fear of being controverted, that it is superior to any other grape cultivated in the United States, for its hardy growth, prolific bearing, and early ripening, large and compact bunches, large berry, few and small seeds. It ripens its fruit in August. The parent vine bears from 10 to 20 pounds of grapes annually.

PRICE OF VINE, LAYERS.
" " SINGLE VINES No. 1, 2.00
" " " " " " 2.00
" " " " " " 1.50

Discount on large orders. Vines sent by mail.
MAIN & NUTTER, Concord, N. H.

GRAPE VINES.

Ives and 40 other varieties, Grape Wood Vine, Kittingany, Philadelphia and Linn's Everbearing, Early Goodrich and Hanson Potatoes.

M. H. LEWIS & CO.,
Sandusky, O.

Strawberry, Raspberry, Blackberry Plants for sale low. Sent for Circular. THOMAS M. VANDERVEER, Freehold, New Jersey.

CURRANTS.

Our Stock of Currants is, without doubt, the largest and best in the country, and includes:

Cherry, Versaillaise, Fertile d'Angers, La Native, White Grape, Victoria, Black Naples, etc., etc. This fruit is attracting greatly increased attention, and bids fair to take the rank it deserves as one of the best of the small fruits. Our plants are 1, 2, and 3 years old, true to name, and of the best quality.

See Catalogue for Descriptions, Illustrations, and Prices.

J. KNOX,

Box 155, Pittsburgh, Pa.

Orange Judd & Co., Agricultural Book Publishers, 245 Broadway, New-York.

BOOKS.

Allen's Domestic Animals.....\$1.00

A History and Description of the HORSE, MULE, CATTLE, SHEEP, SWINE, POULTRY, and FARM DOGS, with directions for Breeding, Crossing, Rearing, Feeding, and Preparation for Market, with their DISEASES and REMEDIES. By R. L. ALLEN. Cloth, 12mo, 227 pp.

Allen's Rural Architecture.....\$1.50

Practical Directions and Suggestions for Construction of convenient FARM-HOUSES, COTTAGES, and OUT-BUILDINGS, including Barns, Stables, Sheds, Carriage and Wagon-Houses, Work-Shops, Wood-Houses, Ash and Smoke-Houses, Ice-Houses, Poultry and Bee-Houses, Dove-Cotes, etc., together with directions for the gardens and grounds; useful and ornamental Domestic Animals, etc. By Hon. LEWIS F. ALLEN, Editor "American Herd-Book," etc. Cloth, 12mo, 373 pp.

American Bird-Fancier.....Paper, .30.

Field, Cage, and House-Birds, breeding, rearing, etc. Paper, 12mo, 164 pp.

American Pomology.—Apples.....\$3.00

This volume has 744 pages, the first 375 of which are devoted to the discussion of the general subjects of propagation, nursery culture, selection and planting, cultivation of orchards, care of fruit, insects, and the like; the remainder is occupied with descriptions of apples. With the richness of material at hand, the trouble was to decide what to leave out. It contains 293 Illustrations. CONTENTS: I. Introductory.—II. History of the Apple.—III. Propagation. Buds and Cuttings.—Grafting.—Budding.—The Nursery.—IV. Dwarfing.—V. Diseases.—VI. The Site for an Orchard.—VII. Preparation of Soil for an Orchard.—VIII. Selection and Planting.—IX. Culture, etc.—X. Philosophy of Pruning.—XI. Thinning.—XII. Ripening and Preserving Fruits.—XIII and XIV. Insects.—XV. Characters of Fruits and their Value.—Terms used.—XVI. Classification. Necessity for—Basis of—Characters—Shape—Its Regularity—Flavor—Color.—Their several Values, etc.—Description of Apples.—XVII. Fruit Lists—Catalogue and Index of Fruits. By DOCT. JOHN A. WARDER, President Ohio Pomological Society; Vice-President American Pomological Society Cloth, 12mo, 744 pp.

Annals.....(Each).....Paper, 50, Cloth, 75

THE AMERICAN HORTICULTURAL ANNUAL FOR 1868. The second of the series began in 1867, and a beautifully illustrated work of 164 pages. Besides being a compendium of the new fruits, flowers, vegetables, &c., published during the year 1867, it contains original articles of permanent value, by well-known writers on horticultural subjects. The Editor has had the collaboration of the Hon. M. P. Wilder, Dr. J. A. Warder, Peter Henderson, Samuel B. Parsons, J. J. II. Gregory, Josiah Hoopes, Geo. W. Campbell, Jas. Vick, F. R. Elliott, A. S. Fuller, Thos. Meeban, and others. It contains an Almanac and Calendar for each month.

THE AMERICAN AGRICULTURAL ANNUAL FOR 1868. In addition to the Almanac, guide for work for each month, numerous useful tables, and minor items there will be found many interesting articles, among which are the following: Factory Dairy Practice, by the Secretary of the Am. Dairyman's Association; Milk and Butter, by Prof. S. W. Johnson, of Yale College; Wastes of Sewerage and Projects for their Utilization, by Col. Geo. E. Walling, Jr.; Horse Breaking and Bitting Colts, by Col. Huxley, of Morristown; Potato Crop of 1867, by Dr. Huxner; Culture of Wheat in Western New York, with a description of favorite varieties, by Joseph Harris; and one on Scythies, Snaths, and Cradles, by John W. Douglass. The work contains 152 pages and is finely illustrated.

THE AMERICAN HORTICULTURAL ANNUAL FOR 1867, as a companion volume to that for 1868, and the first of this series, and

THE AMERICAN AGRICULTURAL ANNUAL FOR 1867, both of them finely illustrated, and very valuable, can be had of the Publishers. Prices same as for 1868.

American Rose Culturist.....30

(Including the Dahlia.) Being a Practical Treatise on the Propagation, Cultivation, and Management of THE ROSE, to which are added full directions for the treatment of the Dahlia. In neat paper covers. 12mo, 96 pp.

American Farm-Book.(R. L. ALLEN).\$1.50

OR A COMPEND OF AMERICAN AGRICULTURE: Being a Practical Treatise on Soils, Manure, Draining, Irrigation, Grasses, Grain, Roots, Fruits, Cotton, Tobacco, Sugar-Cane, Rice, and every Staple Product of the United States; with the best methods of Planting, Cultivating, and Preparation for Market. Over one hundred engravings. By R. L. ALLEN. Cloth, 12mo, 325 pp.

American Weeds, and Useful Plants.\$1.75

An Important Work for every Cultivator—Farmer, Gardener, etc.; being an Enumeration and Description, (with accurate illustrations), of the WEEDS and PLANTS found in American Fields and Gardens, which meet the observation, or require the attention of Cultivators; with practical suggestions for their Eradication when needed. Well practical in its character, it includes both the common and botanical names and characters of the Weeds and Plants, with a Popular Account of the Structure of Plants. By WM. DARLINGTON, M.D., and PROF. GEO. THURBER. Thoroughly Illustrated with 277 Engravings. 12mo., 460 pp.

Bement's Rabbit Fancier.....30

BREEDING, REARING, FEEDING, AND GENERAL MANAGEMENT of Rabbits: their Diseases and Remedies; Full Directions for the Construction of Hutches, Rabbitries, etc.; Recipes for Cooking and Dressing for the Table. Numerous Illustrations. By C. M. BEMENT, author of *Pouter's Companion*, etc. 12mo, 101 pp., in neat illustrated paper covers.

Bommer's Method of Making Manures.

Paper.....25

A method for the manufacture of a superior quality of manure; both from the vegetable and mineral substances, with strict economy and great dispatch; further showing the best mode of preparing vegetable and mineral composts, and a diversity of processes. By GEORGE BOMMER. 8vo, 90 pp.

Boussingault's Rural Economy....\$1.60

Rural Economy in its relations with Chemistry, Physics, and Meteorology; or CHEMISTRY APPLIED TO AGRICULTURE in the Principles of Farm Management, the Preservation and Use of Manures, the Nutrition and Food of Animals, and the General Economy of Agriculture. By J. B. BOUSSINGAULT, Member of Institute of France, etc. Translated, with Introduction and Notes, by GEORGE LAW, Agriculturist. Cloth, 12mo, 507 pp.

Breck's New Book of Flowers, or Flower Garden.....\$1.75

In which are described the various Hardy Herbaceous Flowers, Annuals, Shrubby Plants, and Evergreen Trees, with Directions for their Cultivation. New edition, revised and corrected. By JOSEPH BRECK, Seedsman and Florist, former editor of *New England Farmer*, and *Horticultural Register*. Cloth, 12mo, 336 pp.

Buist's Family Kitchen-Gardener....\$1.00

An excellent Practical work, containing Plain and Accurate Descriptions of all the Different Species and Varieties of Culinary Vegetables, with their Botanical English, French, and German Names, alphabetically arranged; with full Directions for the Best Mode of Cultivating them in the Garden or under Glass. By ROBERT BUIST. Cloth, 12mo., 216 pp.

Cole's American Fruit Book.....75

Containing Directions for Raising, Propagating, and Managing Fruit-Trees, Shrubs, and Plants, with descriptions of the best varieties of fruit, etc. 18mo, 288 pp.

Buist's American Flower Garden Directory.....\$1.50

Containing Practical Directions for the Culture of Plants in the Flower-Garden, Hot-House, Green-House, Rooms for Parlor-Windows, FOR EVERY MONTH IN THE YEAR; with descriptions of most desirable plants, soils, transplanting, erecting a Hot-House, a Green-House, laying out a Flower-Garden, etc., etc. By ROBERT BUIST, a practical Nurseryman and Seed-Grower of Philadelphia. Cloth, 12mo, 342 pp.

Cobbett's American Gardener.....75

A Treatise on the Laying Out and Management of Gardens. Though an old work, it is one which will find a place in every considerable library, as the production of a remarkable man. While it is marked by the author's peculiarities, it is so full of plain common-sense, that it is worthy of being kept in print. By WILLIAM COBBETT. Cloth, 12mo, 230 pp.

Chorlton's Grape-Grower's Guide....75

INTENDED ESPECIALLY FOR THE AMERICAN CLIMATE; being a practical Treatise, with Engravings, on the Cultivation of the Grape-Vine in each Department of Hot-House, Cold Grapery, etc.; with Plans for the Construction and Heating. By WM. CHORLTON. Cloth, 12mo, 204 pp.

Cole's American Veterinarian.....75

Diseases of Domestic Animals, showing the Causes, Symptoms, and Remedies, and rules for Restoring and Preserving Health by good management, with directions for Training and Breeding. By S. W. COLE. Cloth, 18mo., 288 pp.

Copeland's Country Life.....\$5.00

An elegant Octavo Volume, containing 925 pages, and 350 Engravings. It is a Compendium of Agricultural and Horticultural Practical Knowledge; embracing Descriptions, Hints, Suggestions and Details of great value to every one interested in Fruit, Flowers, Vegetables, or Farm Crops. It describes and illustrates nearly the whole range of topics of interest to the Farmer, the Gardener, the Fruit Cultivator, and the Amateur. By ROBERT MORRIS COPELAND. Cloth, beveled boards, 8vo., 925 pp.

Dadd's American Cattle-Doctor...\$1.50.

To Help Every Man to be his own Cattle-Doctor. A work by GEO. H. DADD, M.D., Veterinary Practitioner; giving the necessary information for preserving the Health and curing the Diseases of OXEN, COWS, SHEEP, and SWINE, with a great variety of original Recipes, and valuable information on Farm and Dairy Management. 12mo, 339 pp.

Dadd's Modern Horse Doctor.....\$1.50

CONTAINING PRACTICAL OBSERVATIONS ON THE CAUSES, NATURE, AND TREATMENT OF Diseases and Lameness of Horses; embracing the most recent and improved Methods, according to an enlightened system of Veterinary Practice, for Preservation and Restoration of Health. Illustrated. By GEO. H. DADD, M.D., Veterinary Surgeon. Cloth, 12mo., 422 pp.

Dana's Muck Manual.....\$1.25

A Manual for Farmers; treating of Soils, Manures, Composts, &c., and especially of the important subject of using MUCK, the great natural fertilizer of the country. By SAMUEL L. DANA. Cloth, 12mo., 312 pp.

Downing's Landscape Gardening and Rural Architecture.....\$6.50

The most complete and valuable work ever issued on Landscape Gardening in North-America, for the Improvement of Country Residences; containing full Directions for everything connected with the Laying out and adorning the Rural Home, the Grounds, the Gardens, the Buildings, the Trees and Plants, etc., with principles of taste so stated as to adapt the work to all classes. Splendidly illustrated with many Steel and fine Wood Engravings. By the late A. J. DOWNING. New Edition, Enlarged, Newly Illustrated and Revised, with Supplement, by HENRY WINTHROP SARGENT. Octavo, 534 pp. Extra cloth, gilt, beveled bds.

Orange Judd & Co., Agricultural Book Publishers, 245 Broadway, New-York.

Eastwood's Complete Cranberry Manual 75

Giving directions for the cultivation in different localities, with illustrations and descriptions of varieties. By BENJ. EASTWOOD. Cloth, 12mo, 120 pp.

Elliott's Western Fruit Grower's Guide 1.50

The previous Edition of this work was Thoroughly Revised; embracing all the new and valuable Fruits, with the latest improvements in their Cultivation; especially adapted to the wants of Western Fruit-Growers; full Illustrations. By F. R. ELLIOTT, of Ohio. Cloth, 12mo, 500 pp.

Field's Pear Culture.....\$1.25

THE PEAR GARDEN; a Treatise on the Propagation and Cultivation of the Pear Tree, with Instructions for Management from the Seedling to the Bearing Tree. By THOMAS W. FIELD. Illustrations. Cloth, 12mo, 280 pp.

Flax Culture..... 50

A new and very valuable work, consisting of full directions, from selection of ground and seed to preparation and marketing of crop, as given by a number of experienced growers. 8vo, paper.

French's Farm Drainage..... 1.50

The Principles, Process, and Effects of Draining Land with Stones, Wood, Drain-Pipes, Open Ditches, and especially with Tiles; including Tables of Rainfall, Evaporation, Filtration, Excavation, Capacity of Pipes, cost and number to the acre. With over 100 Illustrations. The best work on Draining published. By JACQUES FRENCH, of New-Hampshire, President of Mass. Agricultural College. Cloth, 12mo, 384 pp.

Fuller's Grape Culturist.....\$1.50

This is the latest and most practical work issued on the Culture of the Hardy Grapes, with full directions for all departments of Propagation, culture, etc., with one hundred and five excellent engravings, illustrating the various operations of Planting, Training, Grafting, etc. New edition, revised and enlarged. By ANDREW S. FULLER, Practical Horticulturist. Cloth, 12mo, 262 pp.

Fuller's Illustrated Strawberry Culturist.....Paper, 20

A new, practical little work, meeting with universal favor. It gives a full list of varieties, down to the latest valuable seedlings. Paper, 12mo, 48 pp.

Fuller's Small Fruit Culturist...\$1.50

A new work, and the only one devoted to SMALL FRUITS. Special treatises of this kind have the advantage that the author can more thoroughly discuss his subject, and go into greater detail, than in a work embracing both large and small fruits. Mr. Fuller has been so long identified with the culture of small fruits, that it is unnecessary to speak of his qualification as a teacher. This book covers the whole ground of Propagation, Culture, Varieties, Picking for Market, etc. The work is most abundantly illustrated.

CONTENTS: I. Raspberry.—II. Strawberry.—III. Raspberry.—IV. Blackberry.—V. Dwarf Cherry.—VI. Currant.—VII. Gooseberry.—VIII. Cornelian Cherry.—IX. Cranberry.—X. Huckleberry.—XI. Shepherdia.—XII. Preparation for Gathering Fruit. By ANDREW S. FULLER. Cloth, 12mo., 288 pp.

Gardening for Profit.....\$1.50

A new work on MARKET and FAMILY GARDENING. It is fully illustrated, and is the first book of the kind prepared by a Market Gardener, in this country. The author is well known, and his successful experience of eighteen years, enables him to give a most valuable record. It is an original and purely American work, and not made up, as books on gardening too often are, by quotations from foreign authors. Everything is made perfectly plain, and the subject treated in all its details, from the selection of the soil to preparing the products for market. By PETER HENDERSON. Cloth, 12mo 224 pp.

Hooper's Dog and Gun..... 30

"A Few Loose Chapters on Shooting," with some Anecdotes and Incidents, Notes on Guns, Choosing and Training Dogs; about Game, etc. By J. J. HOOPER, Montgomery, Ala. Neat paper covers; 12mo, 105 pp.

Gregory on Squashes.....Paper, 30

This little Treatise, which no Farmer or Gardener ought to be without, tells all about selecting the soil for Squashes; how much manure is necessary; how to prepare and plant; about hoeing and cultivating; setting of the fruit; ripening, gathering, storing, care during winter, etc. By JAMES J. H. GREGORY. Paper covers, 12mo, 63 pp.

Guenon's Treatise on Milch Cows.... 75

An interesting work, giving new and peculiar directions, and many illustrative engravings, for determining by natural marks or external signs, the quality and quantity of milk a cow will give, length of time she will continue in milk, etc., with introductory remarks of forty pages on the Cow and Dairy. Sixty-third thousand. 8vo, 83 pp.

Harris' Insects Injurious to Vegetation.

8vo, Extra Cloth, \$4.00. Beveled boards and colored Engravings..... \$6.00

This very beautiful work, edited by the Hon. Charles L. Flint, is the most popular one on entomology, and, indeed, almost the only one not intended for the purely scientific student. The familiar descriptions of the insects are much aided by the excellent plain and colored illustrations. Neither this nor any other work contains all the insects one meets with, but as it comprises those which are injurious to cultivated and wild plants, it includes the more common ones, and is sufficiently systematic to give a general idea of the classification of insects. It takes a practical view of the matter, as well as a scientific one, and gives the means, as far as known, of combating these enemies of the cultivator. By the late THADDEUS WILLIAM HARRIS, M. D. Extra Cloth. Beautiful engravings on steel. 8vo, 610 pp.

Herbert's Hints to Horse-Keepers..\$1.75

This is the best practical work on the Horse, prepared in this country. A COMPLETE MANUAL for HORSEMEN, embracing: How to Breed a Horse; How to Buy a Horse; How to Break a Horse; How to Use a Horse; How to Feed a Horse; How to Physic a Horse (Allopathy or Homoeopathy); How to Groom a Horse; How to Drive a Horse; How to Ride a Horse, etc., and Chapters on MILES and PONIES, etc. By the late HENRY WILLIAM HERBERT, (Frank Forester.) Beautifully illustrated throughout. Cloth, 12mo., 435 pp.

Hop Culture.....40

PRACTICAL DETAILS fully given, from the Selection and Preparation of the SOIL, SETTING and CULTIVATION of the Plants, to PICKING, DRESSING, PRESSING and MARKETING the Crop. Plain Directions by Ten Experienced Cultivators. Illustrated with over forty engravings. Edited by PROF. GEORGE TUCKER, Editor of the *American Agriculturist*. 8vo., paper.

Johnston's Elements of Agricultural Chemistry.....\$1.50

An American edition of the English work. The writer, in addition to a complete treatise upon the Elements of Agricultural Chemistry, suggests modes of thought calculated to lead the reader constantly to reflection. Exact analyses are given of the various substances used as manure, thus giving aid to answer such inquiries. By JAS. F. W. JOHNSTON, M. A., F. R. SS., L. and E., etc., etc. Cloth, 12mo, 321 pp.

Johnston's Agricultural Chemistry.. 1.75

LECTURES ON THE APPLICATION OF CHEMISTRY AND GEOLOGY TO AGRICULTURE. New edition, with an Appendix, containing the Author's Experiments in Practical Agriculture. By the Late JAS. F. W. JOHNSTON, M.A., F.R.S.S. L. and E., etc., etc. This is an American edition of the large and extensive English work. Cloth, large 12mo, 769 pp.

Leach's How to Build Hot-Houses.\$1.50

GREEN-HOUSES, GRAPERIES, etc. etc., and how to Ventilate them. Illustrated with numerous Engravings. This is the only work published in this country, specially devoted to this subject. By ROBERT B. LEACH, Garden Architect. Cloth, 12mo., 205 pp.

Lyman's Cotton Culture.....\$1.50

A new work, and a complete manual for Cotton growing, intended for those who are unfamiliar with the production of this crop. It discusses in the first part, climate, the farm, stock, implements, preparation of soil, and planting, cultivation, picking, ginning, baling, and marketing, and gives a Calendar of monthly operations. A discussion of the extent of the cotton lands, the varieties of the cotton plant, and the insects and diseases that molest it, forms the second part of the work, which also includes valuable statistics and suggestions. An additional chapter has been prepared by J. R. Sypher, Esq., upon Cotton Seed and its Uses, giving the details of manufacturing the oil. The work contains a colored map of the Cotton Lands of the United States, besides other illustrations. By JOSEPH B. LYMAN. 12mo, 190 pp.

Mohr on the Grape Vine.....\$1.00

This is a very plain discussion of the structure of the Vine, and the principles involved in its pruning, training, and cultivation generally. As the propagation of American varieties is different from that pursued in Europe, the translator has given an account of our methods, and added brief notes on the American varieties. By Prof. FREDERICK MOHR. Cloth, 12mo, 120 pp.

My Vineyard at Lakeview.....\$1.25

This book is especially valuable as giving an account of the processes actually followed in celebrated Grape Regions in Western New York, and on the shores and islands of Lake Erie. To any one who wishes to grow grapes, whether a single vine or a vineyard, it is full of valuable teachings. It tells just what the beginner in grape culture wishes to know, with the charm that always attends the relation of personal experience. Cloth, 12mo., 143 pp.

Norton's Elements of Scientific Agriculture..... 75

A valuable and popular treatise on the Connection between Science and the art of Practical Farming. By the late JOSEPH P. NORTON, M.A., Professor of Scientific Agriculture in Yale College. Cloth, 12mo, 218 pp.

Onions: How to Raise them Profitably, Paper.....20

Being the Practical Details, from Selection of Seed and Preparation of Ground to Harvesting and Marketing the Crop, given very plainly by *Seventeen Practical Onion Growers* of long experience, residing in different parts of the country. No more valuable work of its size was ever issued. Octavo, 32 pp. Neat paper covers.

Our Farm of Four Acres, and the Money we Made by it.....30

From the Twelfth London Edition, with an introduction for the American Edition. This work has already had an immense sale, both in England and in this country. It is written by a lady, and while conveying many useful suggestions, it has almost the interest of a romance. 12mo, 136 pp. New Edition. Price in neat paper covers, 25c.; bound, 60 cents.

Pardee on Strawberry Culture..... 75

A Manual for the Cultivation of the Strawberry; with a Description of the Best Varieties. Also, Notes on the Raspberry, Blackberry, Currant, Gooseberry, and Grape. By R. G. PARDEE. Cloth, 12mo, 157 pp.

Peat and its Uses.....\$1.25

A New Work on Peat, thorough and Practical; it gives a full history of Peat, Nirek, etc., telling what they are, where found, and how to estimate their value. It describes the various methods of using Peat for manure, as an absorbent, as an ameliorator of the soil, etc.; and it is especially explicit in regard to the use of Peat as Fuel, describing minutely the various processes employed in preparing it to burn, from the simplest to the most complicated; such as are in use in this country, and Europe. It is illustrated with many Engravings of machines, etc. The work is invaluable to those having Peat or Muck swamps, or wishing to invest in Peat Companies. By PROF. SAMUEL W. JOHNSON, of Yale College. Cloth, 12mo., 163 pp.

Orange Judd & Co., Agricultural Book Publishers, 245 Broadway, New-York.

Pedder's Land-Measurer for Farmers 60

A convenient Pocket Companion, showing at once the contents of any piece of land, when its length and width are known, up to 1,600 feet either way, with various other useful farm tables. Cloth, 18mo, 144 pp.

Quinby's Mysteries of Bee-Keeping Explained.....\$1.50

Newly written throughout, containing the results of thirty-five years of successful experience, with full, plain, and practical Directions for all details of Bee Culture; including also a Description and Manner of Using the Movable Comb and Box Hives, with the most approved modes of Propagating and Treating the Italian Bee, etc., etc., with numerous illustrations. By M. QUINBY, Practical Bee-keeper.

Randall's Fine-Wool Sheep Husbandry \$1.

Giving Prominent Characteristics of Different Breeds; Principles of breeding correctly; practical and concise rules for Selecting the Best, and making the best Crosses for Wool and Mutton. By HON. HENRY S. RANDALL, LL.D. 12mo, 189 pp.

Randall's Sheep Husbandry.....\$1.50

With an account of the different Breeds of Sheep; Selecting the Best for Wool and for Mutton; Rules for Crossing; Practical Details for Rearing; Summer and Winter Management; Treating Diseases; with New Chapters by Henry S. Randall and G. W. Kendall on Sheep Husbandry in Texas, with Portraits of different Breeds, Illustrations of Sheep Folds, and other Articles in Sheep Husbandry. Octavo, 338 pp.

Richardson on Dogs..Paper, 30, Cloth, ..60

Or, Dogs; THEIR ORIGIN AND VARIETIES. Directions as to their Management, Simple Instructions for Treatment under Disease, etc., etc., with numerous engravings. By H. D. RICHARDSON, author of sundry works on animals. 12mo, 137 pp. Neat paper covers, 30c.; bound, 60c.

Saunders's Domestic Poultry..... 75

A New Practical Treatise on the *Preferable Breeds of Farm-Yard Poultry*, their History and Leading Characteristics; with *Complete Instructions for Breeding and Fattening*, including Preparing for Exhibition at Poultry Shows, etc. Very fully illustrated. By SIMON M. SAUNDERS. 12mo, 104 pp. Paper, 40c.; cloth, 75c.

Schenck's Gardener's Text Book.....75

Directions for the Forming and Management of the Kitchen Garden, the Culture and Use of Vegetables, Fruits, and Medicinal Herbs. Cloth, 18mo, 306 pp.

Stewart's Stable Book..... \$1.50

A treatise on the Management of Horses, in relation to Stabling, Grooming, Feeding, Watering, and Working, Construction of Stables, Ventilation, Appendages of Stables, Management of the Feet and of Diseased and Defective Horses. By JOHN STEWART, Veterinary Surgeon. With Notes and Additions, adapting it to American food and climate. By A. B. ALLEN, former Editor of *American Agriculturist*. Cloth, 12mo., 373 pp.

Skillful Housewife.....75

Or, Complete Guide to Domestic Cookery, Taste, Comfort, and Economy, embracing 659 Recipes, with many valuable hints pertaining to household duties, the care of health, *Education of Children*, Gardening, Birds. By Mrs. L. G. ABELL. Cloth, 12mo., 216 pp.

The Miniature Fruit Garden.....\$1.00

On the Culture of Pyramidal and Bush Fruit Trees. Dwarf Apples and Pears are beautiful ornaments, besides being useful in giving abundant crops of fruit; they can be grown in Small Gardens and City Yards, and be readily removed. Root Pruning is fully explained. There are directions also, concerning Dwarf Cherries and Plums, Figs and Filberts. It is a valuable work for the cultivator. By THOMAS RIVERS. Cloth, 12mo., 143 pp.

Thompson's Food of Animals.... \$1.00

Experimental Researches on the Food of Animals, the value of different kinds for feeding and fattening purposes, with remarks upon the food of Man; being details of important experiments made by the British Government. By ROBERT DUNDAS THOMPSON, M. D. Cloth, 12mo, 172 pp.

Tobacco Culture; Full Practical Details.25

This is by far the most useful and valuable work ever issued on this subject. It contains full details of every process from the Selection and Preparation of the Seed and Soil, to the Harvesting, Curing, and Marketing the Crop, with Illustrative Engravings of the operations. The work was prepared by *Fourteen Experienced Tobacco Growers*, residing in different parts of the country. It also contains Notes on the Tobacco Worm, with Illustrations. Octavo, 48 pp., in neat paper covers.

Turner's Cotton Planters Manual..\$1.50

A compilation of facts from the best authorities on the culture of Cotton, its Natural History, Chemical Analysis, Trade and Consumption, with a History of Cotton and the Cotton Gin. By J. A. TURNER. Cloth, 12mo, 320 pp.

Waring's Draining for Profit, and Draining for Health.....\$1.50

The author of this work has been, practically, very successful as a draining engineer, and few, either in this country or abroad, have such monuments of their skill to point at as he, the most important of which is the New York Central Park. This book is a very complete and practical treatise, the directions in which are plain, and easily followed. The subject of thorough farm drainage is discussed in all its bearings, and also that more extensive land-drainage by which the sanitary condition of any district may be greatly improved, even to the banishment of fever and ague, typhoid and malarious fevers. By GEO. E. WARING, Jr. Cloth, 12mo, 244 pp.

Yount on Sheep..... \$1.00

With details for Breeding and Rearing; Notes on Different Breeds; Summer and Winter Management; Characteristics of different Kinds of Wool, with Portraits of different Breeds of Sheep. Octavo, 160 pp.

Warder's Hedges and Evergreens..\$1.50

This is the only book wholly devoted to the Cultivation, Pruning and Management of Plants suitable for American hedging, especially the *Maclura*, or *OSAGE ORANGE*; illustrated with engravings of plants, implements, and processes; to which is added a *Treatise on Evergreens*, their varieties, propagation, culture, etc. By J. A. WARDER. 12mo., 291 pp.

Yount and Martin on Cattle.... \$1.50

Being a treatise on their Breeds, Management, Diseases; a full history of the various races; their origin, breeding, and merits; their capacity for Beef and Milk. By W. YOUNT and W. C. L. MARTIN. A complete guide for the Farmer, the Amateur, and Veterinary Surgeon, with many Illustrations. Edited by AMBROSE STEVENS. Cloth, 12mo, 469 pp.

Yount and Martin on the Hog....\$1.00

A treatise on the Breeds, Management, and Medical Treatment of Swine, with directions for salting pork, and curing bacon and hams. By W. YOUNT, V.S., and W. C. L. MARTIN. American edition, edited by Ambrose Stevens. Illustrated with engravings. Cloth, 12mo., 331 pp.

Yount and Spooner on the Horse..\$1.50

The Structure and Diseases of the Horse, Remedies, Rules to Buyers, Breakers, Shoers, etc. Yount's work somewhat simplified and brought down by W. C. Spooner, M.R.C.V.S., to which is prefixed an account of the Breeds in the United States and Canada, by Hon. Henry S. Randall. Illustrated with numerous engravings. Cloth, 12mo., 453 pp.

Architecture.

Messrs. ORANGE JUDD & CO. supply the two valuable works mentioned below, post-paid, at the retail price, and to dealers at the usual discount.

Architecture.....\$10.00

A most useful, practical book on this subject, giving in detail, on a working, drawing scale, the exterior and interior of various classes of buildings; with 383 designs and 714 illustrations, containing street fronts, suburban houses, cottages, cut-stone work, etc., etc. It is 11 by 14 inches in size, containing only practical work, designs, and illustrations, that separately would cost hundreds of dollars. By CUMMINGS & MILLER, Carpenters, Builders, and Stone Cutters.

Modern American Architecture...\$10.00

An entirely new work, containing designs and plans for villas, farmhouses, cottages, city residences, churches, school-houses, etc. With 55 original plates, giving, in detail, plans and illustrations suited to all parts of the country. By CUMMINGS & MILLER. In sending for this book, it should be stated that Cummings & Miller's "Modern American Architecture" is wanted instead of "Architecture," by the same authors, which is advertised above.

Messrs. Orange Judd & Co. keep in Stock and on Sale the following Books:

STRAWBERRY PLANTS CHEAP.—Wanting to clear the ground, send me a single male, will fill orders from planters, sent before April 15, 5 per cent. lower than any other responsible dealer. We grow 45 varieties. Send for Catalogue. C. E. & J. FRITS, Elwood, N. J.

IF YOU WANT ANY Strawberry, Raspberry, or Blackberry Plant, Grape Vines, Currant, Highbush or Any other Root—Good plants at low prices, address CHAS. COLLINS, Moorestown, N. J. Price Lists gratis.

NOTICE TO BERRYMEN GIVEN—That, as I have been in the many different varieties of Small Fruits (Plants) yet on hand, and those who have not yet ordered should act at once and get my Price List, etc. THOS. B. GILLES, Moorestown, N. J.

RARE CLANCE.—Kittany Blackberry, \$5 per 100; \$10 per 1000. Clark's Raspberry, doz., \$18; Philadelphia, doz., \$10. We are propagating an immense stock, and can furnish, after April 30th, five young vines, with never care at \$1 each, and those who have not set out free at your P. O. at above rates. Special terms to dealers and large planters. Also, DAVISON'S THORNLESS STRAWBERRY, \$1 per 100; \$10 per 1000. Every plant warranted genuine and first class. Many other varieties. A large stock of GRAPE VINES, etc. C. E. & J. FRITS, Elwood, N. J.

TRUE CAPE COD CRANBERRY \$5 per 1,000, \$1 per 100. B. M. WATSON, Plymouth, Mass.

WE OFFER a few hundred MISSOURI MAMMOTH Blackberry and Clarke Raspberry plants at 50¢ per figure. J. W. COSE & CO., Vineland, N. J., March 1, 1868.

JUCUNDA,**Our No. 700 STRAWBERRY.**

We are not responsible for the correctness or well-doing of plants sent out by others, as Jucunda—our No. 700. We know that sprucous varieties are in the market, which will certainly disappoint those who buy them. It is bad policy to plant such, though they could be had for nothing. A variety of such wonderful size, enormous yield, great beauty, and the quality, that can be shipped from our Farm to New York, a distance of 400 miles, and then wholesale at 20 cents per quart, when the market is glutted with other varieties which will not sell at any price, is certainly worthy of very general planting. That the true Jucunda is all this—will do all this, and much more, we unhesitatingly assert. Whoever plants it largely first in the neighborhood of a good market, will reap a rich harvest. No fruit has ever been offered with stronger endorsement by good and competent men. See Catalogue for further information.

We will furnish strong and vigorous plants at following prices:

12 for \$1.00	100 for \$5.00
50 " 3.50	300 " 16.00
	1000 " 50.00

At the price per doz., and single hundred, we will send plants by mail when desired; larger quantities by Express, the purchaser paying Express charges.

ENGINES, SAW, AND GRIST MILLS.

The Old Mt. Vernon Iron Works, established 1831, notwithstanding the general depression in trade, are manufacturing 15 to 25 Engines and Mills per Month, to supply the large and increasing demands for their

Stationary Engines, for Mills, Factories, Furnaces, &c., of from 8 to 2325 Horse-Power. Portable Engines of from 7 to 30 Horse-Power. Thrashing and Plantation Engines, Mounted on Wheels. Circular Saw Mills of all sizes.

Reed & Buckingham's Patent Portable Spring Grist Mills, and Portable Bolts for same.

COMPLETE GRIST AND FLOURING MILL

Machinery, including Best French Burr Mill Stones, Old Dutch Anchor Bolting Cloths, Gearing, Shafting, and all necessary Fixtures. Drafts and Plans for the erection of the Building and arrangement of the Machinery are furnished without charge.

This Firm was the first to commence the practice of furnishing complete Machinery and Fixtures for Saw and Grist Mills, and experienced Millwrights to erect and put the same in operation; hence their unprecedented success, and reputation for building the best Engines and Mills in use. All their machinery is made from the best material, and constructed in the most thorough and substantial manner, and warranted to give satisfaction.

Prices and Terms the most favorable that can be had. Send for Circulars. Address
C. & J. COOPER & CO., Mt. Vernon, Ohio.

AMERICAN INSTITUTE FAIR, Oct. 25, 1877, AWARDED HENRY SEYMOUR & CO., New York. The only Premium Medal for the best SHEEP SHEARS, Pruning and Hedge Shears. These SHEEP SHEARS are warranted to be far superior to "Wilkinson's" in durability and finish. Sold by all Hardware and Agricultural Houses. American Agriculturist for Jan. 1878, says: "We have hitherto been too much dependent upon England for our best cutlery, and sheep shears were no exception. Hardly willing to trust, without the test of use, our own favorable impression in regard to the excellence of these sheep shears, made by Henry Seymour & Co., of this city, we have submitted them to the judgment of practical sheep shearers, who are much pleased with them, and to experts in steel manufactures, who pronounce an unqualified approval, confirming us in our own opinion."

Light, Portable, Cheap, perfect protection and thorough ventilation. Best invention for the forcing and protecting of early vegetables. For sale by Seedsmen and Agriculturists Dealers generally. Wholesale Depot, 7 Broadway, N. Y. 1 St. JOHN & TEMPLETON.

HYDRAULIC

COW-MILKER.

WANTED IMMEDIATELY—All who are looking for business to call and examine the HYDRAULIC COW-MILKER. Pat. May 22, 1895, and Feb. 15, 1896. A *new* cure for *galling* bands and *licking* cows. It milks the *best* cows at *once*. It *indicates* the *calf*—draws and stops *driving* to swallow. It milks cows perfectly dry in from two to three minutes. It is operated by hand, foot, horse, or other machines, milking as many cows at once. It is simple, durable, and self-adjusting. Will fit any cow. Milks three-cent cows as well as any. Easily worked, not liable to get out of order, and has proven by practical use to be more accessible to the cow than hand-milking. A rare opportunity is now offered to the farmer or country man to make money, either by traveling or locating in city or country. HYDRAULIC COW-MILKING MACHINE CO., No. 206 Broadway, New York.

power. One man can attend several machines, milking as many cows at once. It is simple, durable, and self-adjusting. Will fit any cow. Milks three-cent cows as well as any. Easily worked, not liable to get out of order, and has proven by practical use to be more accessible to the cow than hand-milking. A rare opportunity is now offered to the farmer or country man to make money, either by traveling or locating in city or country. HYDRAULIC COW-MILKING MACHINE CO., No. 206 Broadway, New York.

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY

HAVE RECEIVED
TWO FULL CARCOES
OF THE FINEST NEW CROP TEAS.

22,000 HALF CHESTS by ship *Golden State*.
12,000 HALF CHESTS by ship *George Shotton*.

In addition to these large cargoes of Black and Japan Tea, the Company are constantly receiving large cargoes of the finest quality of Green Teas from the Moyne district of China, which are unrivaled for fineness and delicacy of flavor.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st. The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d. The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d. The Importer makes a profit of 30 to 50 per cent. in many cases.

4th. On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1000 to 2000 packages, at an average profit of about 10 per cent.

5th. The Speculator sells it to the Wholesale Tea Dealer in lines at a profit of 10 to 15 per cent.

6th. The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th. The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th. The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these **PROFIT** profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

For manner of getting up Clubs, see former advertisement in this paper.

Parties sending Club or other orders for less than thirty dollars had better send Post-office Drafts or money with their orders, to save the expense of collections by express; but larger orders we will forward by express, to collect on delivery.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for Clubs less than \$50.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of Clubs. They are sold at *caro* prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OO LONG COFFEE, 50c, 50c, 50c, best \$1 30 lb.
MIXED, (Green and Black), 70c, 50c, 50c, best \$1 per lb.
ENGLISH BREAKFAST (Black), 50c, 50c, \$1, \$1.10, best \$1.20 per pound.
IMPERIAL (Green), 50c, 50c, \$1, \$1.10, best \$1.25 per pound.
YOUNG HSYON (Green), 50c, 50c, \$1, \$1.10, best \$1.25 per pound.
UXOLOD JAPAN, 50c, \$1, \$1.10, best \$1.25 per pound.
GUNPOWDER, (Green), \$1.25, best \$1.20 per pound.
Consumers can save from 50c. to \$1 per pound by purchasing their Teas of this Company.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c, 25c, 30c, 50c, best 40c. per pound. Hotels, Saloons, Boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our **FRENCH BREAKFAST AND DINNER COFFEE**, which we sell at the low price of 50c. per pound, and warrant to give perfect satisfaction.

ROASTED (Unground) 50c., 35c., best 40c. per lb.
GREEN (Unroasted) 25c., 30c., 33c., best 35c. per lb.

N. B.—All villages and towns where a large number reside, by **clubbing together**, can reduce the cost of their Teas and Coffees about one-third (beside the Express charges), by sending directly to "The Great American Tea Company."

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *bogus* or *imitations*. We have no branches, and do not, in any case, authorize the use of our name.

Post-office orders and Drafts, made payable to the order of "Great American Tea Company," Direct letters and orders to the (as below, no more, no less)

Great American Tea Company,

STENCIL tools and stock, cheapest and best. METCALF & SON, 101 Union-st., Boston, Mass.

SAVE MONEY AND TIME

BY USING THE IMPROVED SILVER'S PATENT BROOM. Broomed the CHEAPEST, BEST, and MOST BEAUTIFUL BROOM in America. It is so simple that a child can put it together, and the brush is so elastic that it wears twice as long, sweeps with half the effort, and does not wear the carpet one-fourth as fast as the old-fashioned tied Brooms, thus saving time and money.

Mon. Horace Greeley says: "I predict its success." The American Agriculturist says, July, 1867, p. 24: "They are adopted as a Family Institution." The American Institute Farmers' Club says: "With Silver's Patent a child ten years old can make a new broom in ten minutes." The Patent Brass Metallic parts, which last a lifetime, sent to Farmers, (where we have no Agents,) with full instructions for making their own Brooms, by mail, pre-paid, for \$1.25, package best Broom-corn Seed, 15 cents extra, or the agent's complete outfit, by express, for \$5. AN AGENT WANTED in every county. Last year 800 agents were selling it, making \$5 to \$15 per day. At our REDUCED PRICES 500 more can do as well this year. For full particulars send for our new illustrated circulars, naming the first, second, and third choice of counties, to C. A. CLEGG & Co., 391 Fulton-st., (P. O. Box 595), New York.

The above cut represents the

MOHAWK VALLEY STEEL CLIPPER PLOW,

Practical tests prove it to be the BEST STEEL PLOW in the Market. It has taken the PREMIUM wherever and when ever tested, both in this country and Europe. There are six different sizes, made of the best Steel and wooded with the best timber, and adapted to general use in the

A ROMAN FARM-YARD SCENE.—FROM A PAINTING BY C. H. POYNDESTRE.—Drawn and Engraved for the American Agriculturist

This spirited scene, so foreign in its whole air, yet so thoroughly agricultural, affords us a fine opportunity to present the chief peculiarities of form, which distinguish the cattle of Italy. A herd of cattle, which had been turned out upon the Campagna to graze, have been collected by horsemen, and, excited by their halloosings, have rushed, impetuously following their leader, into the wrong enclosure, to the dismay of the occupants of the quaint court-yard, with its odd old well, and shrine of the Virgin, before which hangs the ever-burning lamp. A race of cattle, for years bred without the admixture of foreign blood, their owners perhaps being guided in the selection of breeding animals more by uniformity of color, size, and strength, than by anything else, will, of necessity, present a similarity of ap-

pearance hardly possible among cattle bred for milk and beef, with a secondary regard to other characteristics. Though domesticated, they are essentially a wild race, because they have been bred in accordance with a sort of natural selection, like that which prevails under the rule of the strongest upon the pampas of South America, or great plains of Texas. Travellers in Southern Europe are familiar with the mouse-colored cattle of Italy. This is not the universal color, by any means, yet it exists extensively, shading into dingy cream-color in parts of Tuscany, and running also into French gray with dark legs and heads. The mealy muzzle familiar to us in the Channel Island breeds is universal. The oxen are marked by immensely long and powerful horns, massive necks, and full dewlaps. The

breed is coarse-boned, and the cattle generally thick-hided and poor feeders. Formerly it is likely greater pains was taken in their breeding, but it is said there is now very little, except in Parma, whence the markets of the world are supposed to be supplied with Parmesan cheese. Here a marked improvement in the milking qualities of the cows is noticed, which is no doubt largely due to the introduction of Swiss blood, and it is accompanied by the usual evidences of a crossed or mixed breed. The artist has thrown great character into his animal figures; and the spirited piece of hy-play between the hay-laden horse, the ass, and the goat, introduced boldly into the center of the picture, is a great success, and does not detract from the effect of the alarming incursion of the cattle.

Back Volumes Supplied.—The back volumes of the *Agriculturist* are very valuable. They contain information upon every topic connected with rural life, out-door and in-door, and the last ten volumes make up a very complete library. Each volume has a full index for ready reference to any desired topic. We have on hand, and print from electrolytic plates as wanted, all the numbers and volumes for ten years past, beginning with 1857—that is, Vol. 15 to Vol. 26, inclusive. Any of these volumes sent complete (in numbers) at \$1.75 each, post-paid, (or \$1.50 if taken at the office). The volumes, neatly bound, are supplied for \$2 each, or \$2.50 if to be sent by mail. Any single numbers of the past ten years will be supplied, post-paid, for 15 cents each.

AMERICAN AGRICULTURIST.

NEW-YORK, MAY, 1868.

The average temperature grows warmer, and our cold storms are less cold in May than in April, yet they are cold enough. Seeds will rot in the ground; the plows will be dragged through the pasty soil, and mold it into clods, which will stand as monuments of indiscreet haste; sheep will shiver and snuffle, and lambs will die for lack of protection. We judge these and other things will happen, because it always is so. There is no need of their occurring, or very little, at any rate. May is always unreliable, except for storms and showers of rain. Sometimes we have many days of fine, clear, dry weather, but usually everybody is tired of seeing it rain. Proper efforts having been made, there need be little delay in the more important labors. Year by year, one's practices should improve; year by year, the farmer's reasonings should be more accurate, and his judgment better. This month, the great bulk of the corn crop and more than half the potato crop is planted, much wheat is sown, as also roots of all sorts, except those of the turnip family. There must be hands and teams enough to do the work. No more must be included in the plan for the summer's campaign than can be carried out. The plans for daily labor must be sufficient to keep the men employed all the time. It is very desirable to have men about you, who you know will set themselves at work, but it is a poor plan to give them a chance. Always keep men informed as to what work they are expected to do. With the commencement of steady hard work, it is most important to start right with men and teams in the field, and scarcely less with household arrangements. The meals must be promptly ready, if the hands are boarded at the house; if they "find themselves," accuracy of hours must be exacted as far as possible. If one man begins to take liberties, "loafing," coming late, or knocking off early, it is well to get rid of him at once. Such examples are contagious. In all your relations with hired men, "do justly and love mercy," be the best employer they ever had, and so, attach them to yourself and to your service.

Hints about Work.

Last Year's Mistakes are to be avoided. Take time, do all kinds of work thoroughly and well. If not present, let everything ordered to be done pass under your inspection soon after it is finished.

A Watch on the Markets.—We have almost always either something to sell or something to buy; hence it is always well to watch the fluctuation of prices, and take advantage of them, if possible.

Labor will pay.—Hire more labor—take risks of this kind. If work is well planned, and judiciously carried out, the more there is done, the better off you will be. If money at interest pays, that spent for labor ought to pay fifty per cent better.

Working Stock.—Groom horses daily and thoroughly; rub them dry if they come wet to the stable, either from perspiration or rain. Feed regularly, and when cool, give water. It is well to let a pair of water stand where the horse can drink during the night if he wishes to. Oxen should be well brushed off every day likewise. They are healthier for it, and endure more fatigue. If hard worked eight hours a day, it is all that should be expected of oxen. Give long noons and good fodder.

Cows.—When there is a good strong growth of grass, turn the cows to pasture, but not before. Calves, wearing muzzles set with nails which are well sharpened, but not slender pointed, may run with their dams without danger of their sucking. Cows "coming in" on full feed, often make more milk than their udders have capacity to retain, if milked but twice a day. Neglect to milk oftener causes not only the loss of a pint or two which leaks out daily, but induces a tendency in the cow to secrete less, entailing a loss through the year.

Bulls.—There are hardly enough good full-blood

bulls of all kinds for farmers in every part of the country to be able to secure their services; but if any State would impose a tax of \$50 a year on every scrub or grade bull kept within its limits, the improvement in stock would be most rapid and remarkable. Never, *never* send a cow to a grade bull. See "Basket" item on keeping good bulls.

Sheep.—Shearing festivals and matches, and meetings at which prizes are offered for heaviest and best fleeces, are the order of the day, and very useful. Sheep breeders should plan to attend some of them. It is best for the sheep to shear them unwashed, and early in the present month, if the weather seems settled. If you are obliged to wash in order to get a fair price for the wool, do so, but expose the sheep as little as possible. Farmers ought to tub-wash their wool, and save the rich, fertilizing liquid. Shelter shorn sheep for a few days, both from scorching sun and from cold. In turning sheep to pasture, if the grass is well grown, exercise caution with valuable animals, for fresh grass is purgative, and the sheep often fall off in flesh for a few days, if changed suddenly from hay to grass.

Spring Grains.—As a rule, it is best to let all oats and barley go, unless they are sowed by or before the first week in May. Wheat may be put in a little later, on soil very well prepared, but do not neglect the preparation, except on rich land; apply fine manure, plowed under lightly; harrow thoroughly, adding a dressing of guano, superphosphate, fish guano, or bone dust, with the seed.

The Corn Crop.—Be sure of your seed. It should be early, uniform, and adapted to your land. Manure heavily; plant all, except very large kinds, in drills, rather than in hills with rows running both ways. A heavier stand is thus gained, and the ground well filled with roots. Be careful to have the rows very straight, and, to this end, use a marker. North of lat. 40°, be in no hurry about planting—if the crop is in by the 20th or 25th, it is early enough, and replanting will not be necessary.

Broom-corn.—Plant a little earlier than maize, to give it the benefit of a long season, should the warm weather chance to come early. Plant in drills three feet apart, using plenty of seed, and thin out at the second hoeing. Lime and salt, applied to the soil before or at the time of planting, will check the wire-worms, if the crop be put upon a fresh-turned sod. There should be at least twice the number of stalks to the acre that there would be of corn. The culture is very similar, but it requires more care.

Root crops.—For beets, parsnips, carrots, or mangels, the ground must be deep, rich, and mellow. See hints in recent numbers on this subject, and do not fail to put in a good "patch" on as well prepared soil as you have. All the above-named roots may be sown in May almost as well as earlier; carrots and parsnips, particularly, bear late sowing.

Potatoes.—Finish planting before the middle of the month; it is unsafe to delay longer, though, if the season be a wet one, like the last, June-planted potatoes may do tolerably well. Manure at the first or second hoeing with ashes and plaster, lime, or some concentrated manure, cast in small handfuls upon the plants, if backward, or the soil not rich.

Flax and Hemp.—Like the spring grains, it is hardly worth while to sow flax in May—it should be up and high enough to weed. This weeding is done by barefooted or stocking-footed weedeers, children being preferred, who go through in places, regularly pulling all foreign plants. See *Flax Culture* in our book list. Hemp may be sown, either broadcast or in drills, the latter method being preferable. Put hemp always upon good clean land.

Tobacco.—For minute directions for culture and treatment of this plant, see *Tobacco Culture* of our book list. During the month of May, give the seed-bed great care, weeding, watering, etc.

Sowing Crops.—Sow corn for soiling, using preferably some large-stalked, sweet variety—Stowell's Evergreen or R. J. Asylum. Sow 19 kernels to the foot, in drills about 2½ feet apart. Continue to sow at intervals of about two weeks. No crop is so good for cows in summer, and no other is needed if there is enough of thickly sown corn provided.

Grass and Clover may be sown upon winter and

spring grain early in the month, with very good results. Sown alone on well-harrowed fallow soil, they will do well also. Old "hide-bound" or mossy meadows, full of weeds, or bare of grass, may have new life put into them by a thorough tearing to pieces with a harrow, giving a dressing of 25 or 30 bushels of lime, followed by yard manure or compost, and a fresh seeding with clover and grass.

Weeds.—The warfare begins this month—push it forward. "Whenever you see a head, hit it,"—as is the order of the day at a Donnybrook fair—or better yet, wherever you can find a root, kill it. Remember, weeds may be killed in the seed-leaf by thousands, with the same labor and less thought than will be required to kill them by scores after they have grown. When very small, even stirring the soil in moist weather kills many; when large, unless great pains is taken, though up-rooted, a slight rain will revive them, and they will mature seed as if transplanted for their own good.

Birds and Insects.—Some birds may still be attracted by bird-houses, though most have their nests already built. Do all possible to encourage a feeling of security on their part. They are our best allies in the warfare against insects of all hurtful kinds. Look out for the nests of the tent-caterpillar; destroy when the worms are housed.

Work in the Horticultural Departments.

To the majority of our readers this month will bring a press of work. If the season has been an early one, the young seedlings of some crops will need attention, and if the spring has been a late one, with chilly nights and cold rains, much of the work set down for last month must be done now. In late seasons, nothing is gained by hurrying. Wait patiently until the soil is in working condition.

Orchard and Nursery.

Tree planting is generally over, but where trees have been heeled-in and shaded, they will be in a good condition to set out. Observe notes in previous months on the treatment of nursery trees that have become dried or have started in the packages.

Grafting, if done after growth has commenced, will need care not to injure the trees. The bark at this time easily slips, and there is danger of peeling it off if the limbs are not cautiously managed.

Cions.—Meehan says that if any valuable cions have been left over, that could not be used in grafting, they should be set out like cuttings. This will keep them plump and moist until the bark will run on the stocks, when they may be used to furnish buds for insertion, just as buds of the present season's growth are put in. Worth remembering.

Cultivating the Orchard, especially if a young orchard, is necessary to get a good thrifty growth. Very few will cultivate the ground for the sake of the young trees alone, and it is well to put between the rows of trees such crops as require manure and frequent working. Potatoes, carrots, or whatever will leave the soil in as good condition as to fertility as it was before, may be used.

Mulching cannot be too frequently advocated. It prevents the soil from drying and becoming hard, and keeps down weeds. Almost any litter will do. Leaves from the forest are excellent. Saw-dust is sometimes used, but is objected to by some on the ground that it undergoes fermentation, and becomes sour and injurious to the trees. It will pay to mulch bearing pear trees, if for nothing else but to save the fallen fruit in good condition. Those near the coast use "salt hay." Bog hay, sedges, and the like, will answer equally well. If no mulch can be had, the next best thing is to stir the surface of the soil frequently. The mellow, recently stirred surface soil keeps that below from drying rapidly.

Nursery Trees.—Those budded or grafted last summer will be disposed to throw out suckers from the stock. These are to be rubbed off as soon as they appear; do not let them get large enough to require to be cut away. The same care must be given to small or large stocks grafted this spring.

Seed-beds must be looked to. Young seedlings, even those of our hardiest trees, are very readily injured by the hot sun. The beds may be shaded by a lattice-work of laths, a rough frame covered with evergreen boughs, or any other contrivance may be used that will break the force of the sun.

Insects will begin their work as soon as there is any young growth to work on, and if not checked continue it to the injury of the trees. Don't stop to write us, to ask what shall be done, but kill the insects when first discovered, by some means. We have written in these past years enough about the tent-caterpillar to fill a small volume. We have shown its eggs, and set forth the importance of removing these. Where this has been thoroughly done, there will be but little trouble. Where it has been neglected, they will not "fold up their tents like the Arabs," but keep spreading them all the time. Wherever a nest or tent is seen, no matter how small—and they are very conspicuous when the dew is on them in the morning—do not rest until the nest is destroyed. Bend down the limb, climb the tree, get a step-ladder, or in some way reach the nest, and pull it out and crush the young brood. Some use swabs charged with soft soap, petroleum, or other substances. These will do if faithfully applied, but to our notion there is nothing as sure as pulling the nest off by hand, and putting it under foot. The squamish may wear gloves. Borers are to be probed or cut out. We haven't much faith in squirting any preparation into their holes. The curculio will now begin its work, and must be met at once. Avoid all vaunted remedies and washes, but follow the only sure plan yet known—farring the trees, catching the insect on a large cloth, and killing it. The white grub will often make sad havoc among seedlings and young nursery stock. When a young tree in the row wiles, dig down and find the borer and kill him. Lice or aphides will appear on the young growth. If the trees are small, bend down the ends of the infested twigs, and immerse them in tobacco water or quassia water.

Fruit Garden.

Many of the hints given in this and the previous months, under the head of "Orchard and Nursery," have an application here, and need not be repeated. Finish up all uncompleted planting, and keep the surface of the soil always free from weeds. A pronged hoe, or hoe-fork—especially Hexamer's—will be found preferable to the common hoe.

Grape Vines.—So much was said last month in an article on the vine, concerning the treatment of young vines, that we need only refer to that, and to an article in this paper, on page 186, for all needed directions. If vines removed from the trellis are yet to be fastened up, they will need careful handling after the buds have started. Vines trained with arms should be curved, i. e. the extreme ends of the arm bent downwards to insure an equal starting of the buds along the whole length of the arm. Vines may readily be propagated by putting down

Layers of last year's wood. Make a well-prepared trench, 6 inches deep, and lay the cane down in it, and hold it there by means of pegs. As the shoots start, gradually fill the trench, by adding soil.

Currants.—Keep the ground clean or well mulched. The principal insect enemies to currant culture are sufficiently treated of on page 185.

Strawberries.—Though late, these may still be planted, and better than in autumn. Plants set this spring are often disposed to bear. It is better to remove all the flower-stalks, and let the plant be preparing for a good crop next year rather than waste its strength in perfecting a few berries. Put on a mulch of straw, bog hay, or corn stalks, before the fruit begins to ripen. Saw-dust and tan soil the fruit, and thus defeat one of the objects of mulching. Where the beds are not mulched, keep them clean, and do not disturb the roots in working. If any hoeing is to be done, let it be only on the surface. Pull up all the large weeds by hand.

Picking and marketing should be provided for. Baskets and crates should be bought and marked. Recollect that these things sometimes fail to be

promptly returned, and it is necessary to guard against a short supply of packages by providing an abundant stock. We cannot reply to the question, "Which is the best basket?" as the customs and prejudices of different markets vary so much. The commission dealer is the best judge of the basket which meets with the most favor from buyers.

Insects will infest the fruit garden. Some of these have been mentioned elsewhere. Those which trouble the grape vine at this season are mainly the flea-beetle and the rose-bug. They are both regular "hard shells," and do not seem to yield to ordinary treatment. The flea-beetle does its work on the buds, and the rose-bug is mainly destructive to the blossoms of the vine. As yet, hand picking is the only known help; or, what is the same thing, they may be shaken off when torpid, early in the morning, and caught on a cloth. One who is constantly among his vines can do a great deal of thumb and finger work in destroying insects and their eggs. The leaf-rolling caterpillar must be treated by hand, as it is shielded from any liquids.

Kitchen Garden.

This month usually brings the first products of the garden. Those who had the forethought to have winter spinach, have enjoyed that delicious vegetable ever since the snow disappeared, and so with salsify, horseradish, and others. But from this spring's sowing, even in the most favorable situations, radishes, lettuce, cress, and, it may be, early turnips and carrots, are the first returns received from early sown seed. To our notion, no vegetable that comes afterwards—is eaten with half the zest as these, the first fruits of the garden.

Asparagus.—It is a good thing to have a bed just now; it, like all other good things, costs some trouble and forethought, but whoever has an established bed has a ready supply of a most delicious and healthful vegetable. Cut according to the weather, once in two or three days, or even daily. Use a sharp knife, and be careful not to injure the numerous buds still on the plant. The beetle is so destructive in some localities that asparagus has been abandoned. Its caterpillar is small, blackish, and about half an inch long. An experienced cultivator tells us that a dusting of air-shaked lime will kill them. If this does not answer, cut and burn every shoot, large or small, that is infested. No half-way measures will answer in this case.

Beans.—Plant as soon as danger of frost is over. If the first planting has done well, put in another for succession; if it failed, replant. Limas should not be put in the ground until the cold rains are over. Set poles 6 or 8 feet high, 4 feet apart each way, in warm, light, rich ground. Put 5 or 6 beans around each pole, pressing them into the soil eye downward, and covering an inch. Limas that have been started in hot-beds on sods, may be set in the open ground as soon as the weather is settled.

Beets and Carrots.—Those sown early are to be weeded and thinned. See article on page 188. Sowing may still be done. Where the ground is moderately moist, it is sometimes an advantage to sprout the seeds. Soak them in water over night, pour off the water, and keep the moist seeds covered in a warm place until they sprout. When the germ shows itself, dry off with plaster, and sow.

Cabbages, Cauliflowers, and the less cultivated Broccoli, Brussels Sprouts, and Kohlrabi, are to have much the same treatment. Kohlrabi does best sown in place, and the others transplanted. The early crop should now be well started, and will need frequent hoeing. A heavy sharp rake or a hoe fork is better to work among the plants than an ordinary hoe. Keep the ground stirred often, and the weeds will be kept down. If insects appear, use lime. Sow seeds of early and late sorts in open ground. Winningstadt is one of the best medium. Do not forget to have a plenty of the delicious Savoy.

Celery.—Sow, if not already done. As soon as the plants are large enough, keep them weeded, and the soil loose around them. Turnip-rooted celery, prized by many for soups and salads, may be sown.

Cress or Peppergrass is to be sown every week.

Corn.—Put the seed into the ground as soon as it is safe. Each neighborhood has its favorite early sort. Early Dwarf Sugar is one of the best, but the ears are small. Darling's is early, but of indifferent quality. Stowell's is as yet the best late variety.

Cucumbers.—At the North generally this month is early enough to start the seeds on sods, under glass. When ready to set out, put them in well manured hills. Sow seed in similar hills when the weather gets warm. Use a surplus of seed.

Egg Plants in the hot-bed or frame are to be potted as soon as large enough, or transplanted to another bed, and kept under glass until cold nights are over.

Herbs.—Sow in seed-bed Sage, Thyme, Summer Savory, Sweet Marjoram, etc. The plants will be ready to follow cabbages, peas, or other early crop.

Leeks.—Sow in rich soil, as directed last month.

Lettuce.—Sow and transplant when large enough.

Martynia, the immature pods of which are valued for making sweet pickles, need warm weather. **Melons** are treated in the same way as cucumbers.

Onions.—Sow and plant sets as heretofore directed. Weed the beds clean from the start.

Parsley.—Sow early in beds in the open ground.

Peas.—In hoeing, draw the earth toward the stem. Give brush to the tall sorts before they fall down.

Peppers are warm weather plants, and need the same nursing during their early growth as egg plants.

Potatoes.—Hoe or otherwise stir the ground as soon as the tops can be seen. A dressing of plaster applied at hoeing time is a great help.

Radishes may be had in abundance by making successive sowings. They may be put among slower growing crops, or used to fill spare corners.

Rhubarb.—Allow recently set plants to retain all their leaves until they become well established. Remove flower stalks when they first appear. Never cut the leaf stalks, but pull them; a quick sideways pull will separate them very quickly and neatly.

Spinach.—Sow, if not already done, and thin that already up. The New Zealand Spinach, a quite different plant, is valuable for summer use.

Sweet Potatoes.—Make well-manured ridges, about 30 inches apart at the top; and when cold rains are over, set the plants 15 inches apart. Set them down to the first leaf, and in very dry weather water the holes before putting in the plants.

Squashes need warm weather; treat as cucumbers.

Tomatoes.—Transplant in settled weather. Set Basket item for a way to make a cheap tomato.

Winter Cherry.—Sow and treat as tomatoes.

Flower Garden and Lawn.

Lawns as to their preparation were sufficiently treated in an article last month. A friend asks us to say something about the renovation of old lawns. If the lawn has failed from selecting an unfit kind of grass, the best way is to re-seed it. If through the abundance of weeds, dig out or pull the large ones, apply seed thickly, in order that there may be enough grass to crowd out the small ones, and endeavor to get a close turf at once by top-dressing and rolling. When there are inequalities of surface, remove the turf carefully, and fill up the hollow, or reduce the elevation, as the case may be, and replace the turf, if good. If not, get suitable sods from the pasture or road-side, and use instead.

Turfing.—It is often convenient to cover small areas with turf, and some use it for edgings. Many who lay turfing for the first time, make hard work of it. Prepare and level the ground, and then select the finest sod that the pasture or road-side will afford. Have a board 8 or 10 feet long and a foot wide, to cut by, and a sharp spade or edging knife to cut with. Lay the board down, stand on it, and with the spade or knife cut along the edges of the board and through the turf, so as to have a strip of the size of the board. Carefully lift up one end of this strip with the spade, and commence to roll it up like a piece of carpet. One person should roll, while another with the spade aids the separation of the turf from the soil below. These rolls are readily

transported to the place where they are to be laid, and by unrolling them, the operation of laying is done very rapidly. Use a large knife or edging tool in cutting, to make the edges of the turves fit, and beat down rather firmly by the use of the spade, or by laying down a board, and striking with a heavy pounder. When turves are laid on a steep bank, they can be held in place until the grass has taken hold, by the use of wooden pegs, driven through the sod into the soil.

Evergreens.—Two articles on selection and planting will be found on pages 187 and 188. Have a plenty, but do not crowd them, if intended for ornament.

Bulbs of Gladiolus, Japan, and Jacobean Lilies, Tigridas, and other spring kinds, are to be planted. Tuberoses are so slow, that it is more satisfactory, when practicable, to get bulbs that have been started.

Transplant those things which have been started in hot-beds, when the weather will suit, always previously hardening the plants by free exposure.

Dahlia.—Put the roots in a spent hot-bed or even in a warm exposure, where they can be covered with a mat or board at nights. When the buds start, divide the roots so as to have a bud to each.

Roses will be attacked by insects and will need care. Use whale oil or creosote soap, and frequent hand picking must not be neglected.

Bedding Plants are raised under glass, and if set out too soon, fare badly during cold nights. Most disappointment with these results from putting them out before cold rains and chilly nights are over.

Other Matters appropriate now in many cases we discussed last month, and in the present paper will be found several articles on floriculture.

Green and Hot-Houses.

In bringing out plants, some discrimination must be made between the half hardy and the tender. The plants should be prepared for the change by a low temperature in the house, and abundant ventilation. Those pots not plunged in the borders, should be set on a layer of coal ashes, to prevent the worms from getting into them. Camellias are to be shaded from the hot sun, and all the plants placed where they will not be blown over. Many hard-wooded plants do better if allowed to remain in the house all summer. The glass must be shaded to protect the plants from the burning sun, and the press of out-door work must not allow watering, keeping off insects, etc., to be neglected.

Cuttings.—Most hard-wooded shrubs grow readily from green wood, which should be taken just as it is hardening, but not in too ripe condition.

Cactuses may be planted in the border, or kept upon the veranda; they are very ornamental.

Lantanas.—Those who have conveniences for wintering the plants should train some of these in a tree form. They make most charming ornaments.

Cold Grapery.

If the vines have not yet been put up, it should be done as noted last month. As the growth begins, the temperature may reach 85° during the day. The fruiting shoots should be the strongest and most promising ones. When these are selected, rub off the rest. Preserve the air in a properly moist condition by a free use of the syringe.

A Sample of Hundreds.—The following letter, dated "Haviland Hollow, Dutchess Co., N. Y.," is very similar in character to many hundreds, if not thousands, of letters received at the *Agriculturist* office during the present year, and the same may be said of previous years: "MESSRS. ORANGE JUDD & CO.—I wish to inform you that the 'Premium Watch' came all right. It is, indeed, a beauty. We have now three of your valuable premiums—the cyclopaedia, one dozen table spoons, and the gold watch, which wife pronounces perfect in its kind—and all at a mere trifling cost of time or trouble. I think the three premiums have not taken me from my regular work over a week at most. I guess we will have to get the Steiway or Colibri piano next year.—Yours respectfully, G. HEARN."—There is plenty of time for hundreds of others to secure these fine premiums during the present season. See premium list on following page.

AMERICAN AGRICULTURIST.

ORANGE JUDD & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies; Four to nine copies, \$1.25 each; Ten to nineteen copies, \$1.20 each; Twenty copies and upwards, \$1 each. Papers are addressed to each name.

A Beautiful Book,

Valuable to Everybody;

Sold for only Half a Dollar,

(and sent Post-paid.)

Well Worth a Whole Dollar.

It is also

Presented and sent Post-paid,

For only a few Minutes' Work!

180,000 Readers will Please N. B.

The Offer is to Each one of You!

Our *Agricultural Annual No. 2*, for 1868, and our *Horticultural Annual No. 2*, for 1868, are among the most valuable and beautiful volumes issued in this country during the present year. They are packed full of good information, and each volume contains a large number of beautiful engravings. They are worthy a place in every family, in city, village, and country. They are universally admitted to be the cheapest volumes issued. They are original, the matter and engravings being all prepared exclusively for these volumes by a large number of first class practical writers. As these books are a permanent Annual Institution, and as we have made the volumes for 1868 decidedly superior to those for 1867, (though those were good as a first attempt,) we want everybody to have a copy, for all who get them this year will be sure to want the numbers for 1869 and thereafter. We therefore invite everybody who has not done so already, to send only 50 cents, and secure a post-paid copy of either the *Agricultural Annual No. 2*, or the *Horticultural Annual No. 2*, or send \$1 and get both of these volumes. They are entirely different.

But we will do even better, when desired, viz.: To
 ☞ any person sending during the month of May ☞
 ☞ a subscriber to the *American Agriculturist* for ☞
 ☞ 1868 at the regular price (\$1.50), we will ☞
 ☞ present a copy of either of the above-named ☞
 ☞ Annals that may be desired, and we will ☞
 ☞ send it post-paid to any point in the United ☞
 ☞ States or Territories, (except to those places ☞
 ☞ reached only by the Overland Mail, as that ☞
 ☞ mail will not carry books unless prepaid ☞
 ☞ letter postage.)....A few minutes' work or ☞
 ☞ talking will enable any person to secure a ☞
 ☞ subscriber to the *Agriculturist* (as valuable ☞
 ☞ as we are now making the paper), and ☞
 ☞ then the *Annual* will be obtained free. ☞

N. B.—One Annual is offered for each subscriber sent at \$1.50. The sender can choose any one of the four Annals already issued, viz.: *Agricultural No. 2* for 1868, or *No. 1* for 1867; or *Horticultural No. 2* for 1868, or *No. 1* for 1867. One, two, three, four, or more subscribers will secure an equal number of Annals, of any issue desired....N. B.—These premium Annals are special, and are not included in the general premiums which are separate, but are continued, as noted elsewhere.

MAY, MAY, THOU MAY, HE OR SHE MAY.

We may say there are many good things some persons may do in this month of MAY, but there is one thing that a great many persons MAY do and can do—and easily do it, too. There are over 30,000 Post-Offices in the United States and the Dominion. We have subscribers at most of these offices, but we have sent premiums to only about 5000 of them as yet, though there is hardly a Post-office where there are not persons enough to make up a premium club, and persons, too, who would gladly take the *Agriculturist*, if they only knew its value and cheapness. (The first four numbers of this year, for example, contain 164 large pages, over 140 engravings, and a very large amount of useful, practical reading matter for the Household, the Garden, and the Farm. The next eight numbers will be equally valuable or better, and yet the *Agriculturist* for the whole year is furnished for only \$1.50, or about the cost of the white paper it is printed on). The fact that so large a number of persons have obtained premiums, is one proof that others can do the same thing at other Post-Offices. Indeed, at some larger offices men and women have obtained subscribers enough to get several premiums. Single individuals have this year received from \$500 to \$1500 worth of premiums each. One lady alone has obtained two \$650 Pianos and sold them, besides getting a lot of other premiums. Now there are over

25,000 Post-Offices

still left, at most of which any enterprising person may get one or more valuable premium articles, (see list of them in the next column,) and do it during this month of May. It will be seen by the table, that only 11 or 13 subscribers are required for several of the good articles offered. More than this number have been obtained at a multitude of the smallest post-offices in the sparsely settled regions of the Far West, and in the northern regions of New England, New York, and almost all over British America. Single post-offices in Nova Scotia take from 100 to 200 copies each. Our "Explanation" last month showed how and why we can give these large premiums, and we now renew the invitation to all our readers, to make the effort this month to secure a premium article. Every copy of the paper introduced into a neighborhood will awaken thought and stimulate improvement, guard the people against humbugs, and be useful in many ways. Persons have told us that improvements, set a going by this journal, have resulted in almost doubling the value of real estate—thus adding scores of thousands of dollars to the real wealth of a single locality. It is indeed very natural that this should be the case.

But aside from the good done to others by introducing a journal of this character, the premiums appeal to one's own direct, immediate, personal interest. The premium articles are all very good and valuable, and a few hours of canvassing will secure one of them without cost. Try it with a will and determination to succeed, and in nine cases out of ten you will be successful. Take a copy of the paper, exhibit it among neighbors and friends, in your own neighborhood and elsewhere (for premium clubs need not be at all one post-office), show what the paper is, what it is worth, how cheap it is, and in a brief time the desired number of subscribers can be gathered, and the premium secured. A full description

of the premiums on a separate sheet will be sent free to any one desiring it. Any Specimen numbers, cards and show bills needed, will be supplied free. A multitude of persons have during April completed lists already begun, and have begun and made up new lists. May is just as favorable a season for thousands of others to do the same. TRY IT.

We take so much pains to procure only good articles in all cases, that any one securing anything from our premium list, saves the risk usually run of getting poor or indifferent goods, when buying of unknown or irresponsible parties. Everything we send out as a premium is guaranteed to be the best of its kind and price.

Old and new subscribers count in premium lists. As fast as subscriptions are obtained, send them along, that the subscribers may begin to receive the paper; and when all the names that can be obtained are forwarded, select the premium, and it will be promptly furnished. To save mistakes and keeping accounts, send with each list of names, the exact subscription money.

Remit in Post-Office money orders, drafts or checks on N. Y. City; if these cannot be had, register money letters.

Every name designed for a premium list must be so marked WHEN sent in. (We cannot count others.)

Table of Premiums and Terms, For Volume 27—(1868).

Open to all—No Competition.

No.	Names of Premium Articles.	Price of Premiums.	Number of Subscribers required.
1.	Garden Seeds for a Family (40 kinds) \$5.00	10	37

Every article on our list is the best of its kind, and, in all respects, what is claimed for it. No charge is made for picking or boxing any article in our Premium List. The forty-four Premiums, viz., Nos. 1, 2, 6, and from 36 to 39, and from 50 to 86 inclusive, will each be delivered FREE of all charges,

by mail or express, (at the Post-Office or express office nearest recipient), to any place in the United States or Territories excepting those reached only by the Overland Mail.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance that may be specified.

Nos. 50 to 60—VOLUMES OF THE AMERICAN AGRICULTURIST (Unbound).—These amount to a large and valuable Library on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. We have stereotype plates from the Sixteenth to the Twenty-sixth Volumes complete, from which we print numbers as needed. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid. They are put up in clean numbers, with the Index to each volume.—They are profusely illustrated, the Engravings used in them having alone cost above Twenty Thousand Dollars! Those obtaining premiums for less than eleven volumes, can select any volumes desired, from XVI to XXVI, inclusive. For ordinary use, the sets of numbers unbound will answer quite well.—Many hundreds of these volumes are taken every year as premiums.

In Nos. 61 to 71 we offer the bound volumes also.

Nos. 74 to 85—GOOD LIBRARIES.—In these premiums, we offer a choice of Books for the Farm, Garden, and Household. The person entitled to any one of the premiums, 74 to 85, may select any books desired from the list below, to the amount of the premiums, and the books will be forwarded, paid through to the nearest Post-Office, or Express office, as we may find it most convenient to send them.

No. 86—General Book Premium.—Any one not desiring the specific Book Premiums, 74 to 85, on sending any number of names above 25, may select Books from the list below, to the amount of 10 cents for each subscriber sent at \$1; or to the amount of 30 cents for each name sent at the (too) club price of \$1.30 each; or to the amount of 60 cents for each name at \$1.50. This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through by us.

BOOKS FOR FARMERS AND OTHERS.

(For sale at the office of the <i>Agriculturist</i> , or they will be forwarded by mail, post-paid, on receipt of price.)	
Allen's (H. L.) Rural Architecture	\$1.50
Allen's (H. L.) American Farm Book	1.50
Allen's Diseases of Domestic Animals	.75
Am. Agricultural Annual, 1867 & 1868, each, pt. 2d, 40c.	.75
Am. Horticultural Annual, 1867 & 1868, each, pt. 2d, 40c.	.75
American Bird Fancier	3.00
American Poultry—Applies By Dr. John A. Warder	3.00
American Weeds and Useful Plants	1.00
Architecture, by Cummings & Miller	10.00
Architecture, Modern Am., by Cummings & Miller	10.00

Ward's and Spence on Cattle	1.50
Yonah and Martin on Cattle	1.50
Yonah on the Hog	1.50
Yonah on the Pig	1.00

The Best Machines—Consistent

"Notices."—We were amused the other day by receiving from a Western subscriber two "notices" cut from handbills, but both credited to the *Agriculturist*—one recommending one machine, and the other speaking just as strongly of another, as the best. It happened thus: Some seven or eight years ago we commended a machine as the best we knew of; a year or two later a new machine came out which was decidedly superior, and we then spoke of that as the best. It seems that the recipient of the first "notice" still continues to quote the recommendation, but without giving the date, while the manufacturers of the later machine also quote our opinion of their machine.—We have noticed this same thing in other cases—especially in sewing machines. We cannot follow up all the advertisements and handbills in the land, to keep them straight. Having no pride of opinion (often styled "conservatism,") we are ready to adopt the newest thing, if the best, and to say so. Those who read the *Agriculturist* regularly will find no discrepancy, but rather a steady consistency, and will know our latest experiences and observations. We claim to progress in knowledge, and expect to find improvements, good, new things, coming out every year, and to talk about them.

Saw-dust as Manure.—

The common practice of throwing this article into the streams on which saw-mills and shingle-mills are situated, is reprehensible. It would not pay to spread it upon a muck swamp, but upon any sandy land, or light, gravelly loam, deciduous in vegetable matter, it would prove a good dressing, and in time would show good results. The best use we have ever seen it put to, was bedding for animals in stables. It is an excellent absorbent, and will keep cows clean, even better than straw. It is also a very light, handy article in the barnyard, and more cleanly to handle than muck in common, open, privy vaults. The article is merchantable in cities, and is quite extensively used upon floors in eating saloons, and for other purposes. At country mills, it can generally be had for the carting, as mill owners are glad to be rid of it. It is a good substitute for straw, and this is now worth so much for manufacturing purposes, in many parts of the country, that no thrifty farmer can afford to use it for bedding.

Ice Profitable.—

Some curious figures about ice in N. Y. City are given in another item. We have often spoken in the *Agriculturist* of the utility of ice to farmers, aside from its comfort and convenience. Any one having access to a pond of clean fresh water, in a region cold enough to give 6 inches or more of clear ice, can readily construct a rude receptacle that will retain it during most of the summer, and store a family or dairy supply at a few dollars' expense. The writer has delivered at his residence 30 to 40 lbs. of ice per day from May 1st to Nov. 1st, at a cost of \$3 per month in May, June, September, and October, and \$4 per month during July and August, or \$30 in all. A somewhat careful calculation shows that the saving in less frequent bakings of bread, in milk, potatoes, and other vegetables, which are kept much longer from souring or becoming dry or stale, and especially in meats, which can be provided in large quantities without loss, amounts to much more than the 11 cents a day paid for ice. The better quality of the ice-kept food makes it go further, and saves in butter and other materials. The only drawback is the temptation to drink too much of the nicely cooled water, with meals and at other times, in hot weather. This must necessarily be controlled by the exercise of reason and the will.

Loading Logs without Gins.—

"Saw-log" (not the "Saw-log Man" of fame, we presume,) writes us from Chicago Co., N. Y., how he loads logs in a simpler way than that described by "L." of Iowa, in a previous number. His process is exceedingly simple. Two ropes or chains extend from the sled around, under, and over, the log, and back over the sled, where they are united. Skids are laid, and the team hitched to the ropes or chains. "Saw-log" says: "Then go ahead with your team, and if they won't roll on any log that they can move after it is on the sled they are not like our teams. We use chains the same as we bind with, and when one team is alone, take along an extra chain."

Shall We Raise Corn at the East?

asks "V. D." Mass.—Yes. The average cost of raising it in the Connecticut River valley does not exceed seventy-five cents a bushel, and at present prices there is about that amount of clear profit. The cost of raising can be a good deal diminished by using the horse more in cultivation, by planting in drills, and by applying more manure to the acre. It pays a great deal better to raise eighty bushels of corn to the acre, than it does to get forty. It takes more manure and a little more labor, but it makes the cost of the corn per bushel, a good deal less.

Just try on well-prepared land, drill planting, the stalks to stand one foot apart; the application of three hundred pounds of fish guano per acre to the growing plants at the second cultivation; and cultivate with horse power at least six times. This last is practicable on all smooth lands, and gives big crops at a small cost per bushel.

Use of Plaster in Stables.—"Will it pay to sprinkle plaster in the stables daily? If so—how much?" It pays to apply simple plaster to moist soils; of course it pays better to use the plaster beforehand, to fix ammonia, as it does when used in stables. Enough only is required to dust over the surface, which is moistened daily by the droppings and urine, and to sprinkle along the liquid manure gutters—say half a pint to each stall.

Land Plaster or Gypsum.—"J. H. W." Beaver Dam, Wis., asks: "Will land-plaster lose strength by lying exposed to the weather?"—"It will not lose strength, but will go to waste. Water at ordinary temperatures dissolves it slowly; hence it would be washed away more or less, if left exposed. It requires about 400 pounds of water to dissolve a pound of gypsum. If a heap, which covered ten feet square, were to be exposed to the action of two or three hard rains, during which, say four inches of water should fall, there would be only about five pounds of plaster dissolved and washed away, for four inches of water, covering one hundred square feet, would weigh about 977 pounds.

Co-operative Farming.

—"H. K." Waterbury, Vt., writes: "We have no acquaintance with the working of these enterprises in this country. They have been tried in England, and are said to be successful. We see no reason why the plan would not work just as well upon a farm as in a manufacturing establishment. The capital invested in the land, buildings, tools, stock, etc., must first draw interest. Then the overseeing and labor must be paid. After allowing a small sum for depreciation of buildings and tools, the balance of profit might be divided among the laborers. It would, of course, be better for the workmen to own a part of the capital, but this would not be necessary. This plan would give every man a personal interest in the success of the crops, and make him faithful. It would also prevent strikes, and the jealousy that so often exists between the employer and the laborer. There is a farm of this kind at Halliburton, Peterborough county, Canada West, and a little personal observation of its working would be desirable before starting a new enterprise on the co-operative plan.

Experiment in Pig Feeding.

—"M. Pleasant, Pa., writes to the *American Agriculturist*:" "I took a pig that weighed 12 pounds, put him in a tight pen, and fed him three bushels of corn chop [coarse meal probably.—Ed.] and gave him cold water to drink. After eating the three bushels of corn his weight was 73 pounds, showing a gain of 60 pounds."—"With corn at \$1 a bushel, this is five cents a pound for pork, live weight.

Cows at Calving.

—"1. Do you make it a point to be present when your cows calve, or to have some body present? 2. What harm in having a cow pretty fat when she comes in? 3. My cow is now dry, will calve in three weeks, has one pint of oil-meat a day—shall I feed her more? 4. She is good beef, but not fat—suppose the cow calves in her stall with her head tied—what harm?" 1. It is well to be present yourself or to have some trustworthy person present, but in forty-nine cases out of fifty the cow would do just as well alone. It fact, far more cows are injured by the hasty officiousness of the attendant than by neglect. 2. No harm in having a cow moderately fat when she comes in. It is far better than to have her poor. She will be stronger and healthier, and the calf will be fatter. If she is a good milker, you will get back all the fat in the form of nice, yellow butter. 3. Give her enough to keep her bowels slightly relaxed. Two quarts a day will not hurt her. We have frequently fed four quarts a day. If she is cistive, you may give her linseed tea—two quarts of flaxseed boiled in two pails of water. 4. We frequently have them calve so, but it is better to have them free.

Capons of the Largest Size.

—"Y. Y. C." Carroll Co., Md. We have no doubt that the use of a Grey Dorking cock with either Brahma or Cochins hens would give you the fowls you desire for early Capons of very large size—handsome, compact, and heavy. We would prefer to own Dorkings and Brahmas. The hen imparts size and plumage, the cock color of flesh, aptitude to fatten, and also, in a great measure, style and shape.

Report of the Maine Commission

on Fisheries.—This is a document of 197 pages, showing the present condition of the fisheries in Maine, and what needs to be done to restore fish to the rivers in

their former abundance. There are twenty-seven rivers in the State emptying into tide water, besides smaller streams, in which salmon, shad, alewives, and other valuable fish, were once found in abundance. From many rivers salmon long ago disappeared, and only in the Penobscot, which is least obstructed by dams, are they caught abundantly. In this stream about 12,000 salmon and 2,500,000 shad are caught annually. In the Kennebec, where 300,000 were formerly taken, not more than a hundred are caught in average years. The causes of this diminished yield of fish are mainly the building of dams, cutting off the fish from their breeding grounds, and overfishing. Maine is better supplied with rivers for breeding shad and salmon than any other State, and the restocking of these streams is a matter of the highest importance to her people, and indeed to the whole country, as there is hardly any limit to the consumption of these fish. With suitable legislation for all our rivers, pickled salmon and shad will be as plenty as cod and mackerel.

King Dagobert Fowls.

—A Paris correspondent of The Nation has the credit of putting a curious tale in circulation; it is this:—The Abbé Denis, curate of a church in the Faubourg St. Antoine, Paris, has just erected a church on what is said to be the site of an old chateau of King Dagobert; beneath the ruins was found a hen's nest full of eggs, where no hen for the past 1,300 years could have laid them. They were hatched, and a new breed of fowls is the result. The benevolent Abbé is about to organize a sale of Dagobert eggs for the benefit of the poor of the parish. Our readers need hardly be informed that eggs could never keep so long, even if we admit the story of the mummy wheat. Whether any one among our readers may be found to endorse this "pious fraud" or not, we all must admire the ingenuity of the French in "getting up" marvellous stories and palming them off as facts. This is much like the story of the great horse-donkey-henry of Mons, De Rora, which was so widely believed and so many times proved to be false.

1,260,000,000 Pounds of Ice have

been stored the past winter by only five of the New York City ice companies—nearly two-thirds of it by the old Knickerbocker Company alone. If we allow the odd 200,000,000 lbs. for waste, we still have 1,060 lbs. or half a ton (200 lbs.) each for the city and its suburbs of Brooklyn, Jersey City, etc.—an average of nearly 6 lbs. per day for every man, woman, and child, during the six summer months. The distribution is by no means equal, however, for a large proportion of the poorer classes use no ice directly, except in the drinking shops—though the meat they consume is generally kept on ice, or in ice-cooled rooms or boxes.... It would, at first thought, seem as if so large an amount of ice brought to the city, would in some measure reduce the general summer temperature. How slight the effect may be judged from the fact that all this ice has been gathered from about 400 acres, the area of a moderate-sized city ward, and we know how soon such a field of ice would disappear under a July sun.... If we allow for the amused ice that is exported, and estimate for only half of the amount now in store to be used and paid for, at an average price of 1/2 cent per lb., we shall still have the respectable sum of one and a half million dollars paid this year by New Yorkers to "keep cool."

Olive Culture.

—"G. C. II." writes: "I have read what you say about 'The Olive and its Culture,' and having resided many years in Syria, where the olive grows luxuriantly and lives to a great age, I may be allowed to add my mite to your statement. From all I can learn, the climate of Syria approaches nearer to that of California than to any other part of the United States. The soil in which it flourishes best is a chalky marl, or crumbled strata of limestone. It seems to delight in penetrating its roots into the clefts of the rock and crevices of flinty marl. If the mould is so deep as not to allow its roots to reach the rock beneath, it is said to suffer in consequence, and the berries become small and juicyless. In places where the soil is sandy, a good supply of chalky marl is applied to the trees; no manure is necessary when the tree can have this marl, which seems to be its natural soil. The tree requires but very little labor or care of any kind; it hardly yields a crop of any consequence until it is fifteen years old. It bears an abundant crop generally every other year. In Syria, it does not flourish more than 3,000 feet above the sea, and in the interior not so high. It does not flourish in Egypt, which is warmer than Syria; probably because the soil is not suitable.

A New Disease among Fowls.

—J. W. Stafford, of Cleveland, O., has had two hens that swelled up very large and died. He says: "I opened them and found a large swelling that looked more like sheep's pluck than anything else I can compare it to, but it was harder. It seemed to fill the whole inside." Have any of our readers had experience with anything similar?

Obtaining Credit under False Pretences.—If a man obtains possession of a lot of books from us under a false representation, he will, if convicted, be sent to the State Prison. A scoundrel of this kind, knowing the risk he runs, shows a certain amount of daring, and we have for him something of respect that we have for a highwayman—that small amount which will direct of courage will command. If there can be a difference in thieves, we hold the highwayman who boldly demands "your money or your life" far above the sneak thief, who steals in at the hall door and takes our great coat. On a par with these sneak thieves are those who, by garbling our writings or by putting what we have said in a false light, make us appear to say just the opposite of what we did say. We will give an illustration of meanness, mingled with audacity, which defies common law as well as common decency. The "Independent," a professedly religious newspaper, allowed a vender of quack medicines to advertise his nostrum in a way that no journal should tolerate, unless its readers are of a different class from what we take those of the Independent to be. Nastiness in many of the daily papers does not surprise us; but such stuff in a paper professing to lead people in the right way, induced not only the *Agriculturist*, but the *Christian Intelligencer*, N. Y. Evangelist, and other papers, to speak out, and in no measured words, concerning this outrage upon propriety and decency. In rapping the Independent over the knuckles, we were obliged to allude to the quack medicine. This was "nuts" for the vender of the stuff; his name was not mentioned, and he was only concerned in our notice by inference. As some dogs thank you for any attention, even if it be a kick, this fellow, with a meanness parallel to that of a sneak thief, and an impudence almost equal to that of the highwayman, advertises his nostrum in the daily papers, and there says, "The American Agriculturist! he had better go to evening school and learn how to spell, Orange Judd & Co., proprietors, having seen my advertisement, are fully acquainted with its uses and merits." He quotes other papers also, and adds: "The editorials in the above papers were entirely unelicted by me; in fact I have no personal acquaintance with any of their publishers, and sufferers will do well to call on them before purchasing, in order to obtain further information." As this fellow pretends to refer to us, we say if any one has any nasty disease for which this nasty medicine is advertised, don't follow the pamphlet which is sent about privately and is to be had by addressing this quack medicine vender's New York or Philadelphia shops. Don't buy the medicine, but go to a regular doctor. But if you think the Independent's endorsement, by admitting the advertisement, outweighs our condemnation, and will buy his stuff, take out the exact price and leave your pocket book at home. Our "good name" having been stolen, we really don't know what might happen to your "purse." The fellow is quite right in saying he has "no personal acquaintance with the publishers," and we give him the benefit of the only truth he has stated about us.

Pigeons Destroying Grain.—"H.," of Morristown, N. J., gives us the following figures: Having shot a pair of wild pigeons on a wheat field, after they had had time to pretty well fill themselves, he counted in the crop of the hen 429 grains of wheat; in that of the cock, 361. Afterwards a tame pair were shot under nearly the same circumstances, and 371 grains found in the hen pigeon, and 132 only in the cock.

Mulching Apple Trees.—"G. L.," Warwick, R. I. We have no experience in the matter, but we have no sort of its utility. Pear trees are very much benefited by a mulch during the summer. Capt. G. Pierce, of Abington, Mass., spreads about a ton of salt hay to the acre in his apple orchard, and thinks it pays.

Worms on Trees.—"H. C. T.," Lansingburgh. The English sparrows have cleaned the trees of worms in New York and vicinity, wherever they have been welcomed. They are sheltered in small boxes, are fed on seeds and watered constantly in winter, and in summer take care of themselves. Just how much damage they would do in a garden we cannot say. They would certainly keep the insects in check, and if the birds became too numerous they could readily be disposed of.

Why Use Muck in Barns and Stables?—"O. D. T.," Fairfield. Mainly to prevent the waste of the most valuable parts of the manure. Muck or peat absorbs the ammonia, adds to the bulk and value of stable manure, and for most farmers its cartage pays.

Chimney Tops.—"H. J. S.," Hestonville, Pa., advises to lay the bricks of chimney tops in Roman cement. In order to prevent (measurably) the corrosive action of coal gas and of the weather on the mortar.

Tight Barns.—"R. S.," Walpole, Mass. Modern barns are made tight, and furnished with ventilators at the top. It is of great importance that the ventilation should be regulated, which is quite impossible with wide cracks between the planking. It saves a great deal of fodder to have the temperature kept above freezing point in the stables, and this is quite practicable with tight floors and good ventilation, even in New England, and other places, where the winter is severe.

Salmon Hatching in New Hampshire.—The impregnated eggs in the hatching works at Charlestown, deposited by the fish commissioners, have been successfully hatched. Only one per cent failed. These fish will be artificially brood until the spring of 1869, when they will be ready to go to the sea. It is demonstrated that fish can be raised cheaper than any other animal food, and can be made abundant even in the densely populated districts of Central Europe.

Whitlock's Horticultural Advertiser.—Mr. Whitlock, in connection with his "All Nurseries in One," publishes a journal which is in the main devoted to advertising, but has always much interesting and valuable reading matter. The increase of Mr. W.'s business has made it necessary for him to engage the editorial assistance of Mr. A. S. Fuller. Mr. F. is one of the few "practical men," to use the current phrase, who can write well. He will doubtless give increased value and interest to Mr. Whitlock's useful journal.

A Handy Garden Trellis.—It is often convenient to give tomato vines and other plants a low support, and some neat trellis is required.—"Reader," of Brooklyn, N. Y., sends us a drawing of a neat and easily made trellis, which, though not new to us, may be to some of our readers. He says: "I take a stave of a barrel, and split it into three pieces, sharpen one end of each and drive them into the ground, about a foot deep, in the form of a triangle, just so far apart that when a barrel hoop is put around the tops, the outward strain will hold it in place; then tie on the hoop to the sticks, as shown in the engraving. I use small tarred rope or 'Ratlin' to tie with. These frames are made very easily, and when only a limited number of vines are kept, are very desirable."

Manure Sheds vs. Cellars.—The same correspondent also asks: "Are not manure sheds generally preferable to cellars?" We do not know that they are. It is a question of convenience. No system, either of cellars, sheds, or open ground, is best in all places. And the best rule we can give is to adopt the plan that most economically provides a "tidy barn-yard" and a pure atmosphere. Good taste and good management go together, at least in this case.

Mohr on the Grape Vine.—This little work on the vine has pleased us so much that we feel it a duty to call the attention of grape growers to it, as the most intelligent presentation of the principles of grape culture yet offered. Those who have read the articles in the *Agriculturist* on the vine, in the issues of the present year, will see that we have drawn upon this work for some interesting illustrations. To those who wish a set pattern by which to try to grow their vines, we do not commend this work, but to those who desire to study the habits of growth of the vine, and to know just what they are doing, the book of Dr. Mohr cannot fail to afford instruction. A most useful chapter on the propagation of American varieties is appended by the translator, "Horticulta." A neat illustrated volume, sent by mail for \$1.

Applying Manure to Growing Crops.—"J. Y. A.," Onondaga Co., N. Y. If from any cause broadcast manuring has been neglected, it is frequently desirable to apply manure to growing crops. This should be done before they are half grown. We have often seen concentrated manures upon the grass crop with excellent results. It is easy to double what would be a light crop of hay, by applying Peruvian guano, or the fine ground fish guano, in the month of May. A great change is seen in the color and vigor of the grass, within two or three days after the application, if it is made in rainy weather. Ashes alone, or ashes and plaster, are good top-dressings for potatoes. Any of the concentrated fertilizers, if honestly made, will pay on the corn crop, at the first or second cultivating. All garden crops are benefited by top-dressings, and if these are applied in the form of liquid manure, so much the better.

Manure from Barn Cellars.—"A col.," respondent has seen it stated in an agricultural paper that the manure from a barn cellar "contains an injurious acid that needs to be corrected by frost," and asks the *Agriculturist* if such is the case. We know of no such acid. There are several organic acids formed during the decomposition of straw and manure, but the ammonia formed at the same time from the nitrogenous matter, urea, etc., neutralizes them, in part at least. And they are thus very useful in "fixing" the ammonia. When a great deal of peat is used in the cellar, large quantities of organic acids will be present in the manure, but on soils free from excess of water they will do good rather than harm. In case the manure has been kept so water-soaked that only imperfect fermentation has taken place, the best way, we think, to correct this would be to draw out the manure to the field, where it is to be used, and pile it for a few weeks to ferment, before spreading it on the land. In cold cellars, and where the pigs tread it very firm, it is not improbable that little or no fermentation takes place. But even in such a case, we think no acid would be formed from the manure. There are acids in peat and muck which resist decay, unless acted on by frost, by a ferment like animal manures, or by alkalies, like ammonia, ashes, lime, etc. By piling the manure, however, and turning it over once or twice, or in any way subjecting it to the influence of air as well as water, all difficulty of this kind would be overcome.

Cheap Homesteads in Missouri.—D. S. Donegan, of Licking, Texas Co., Mo., sends an earnest invitation for settlers to come to that county. He says there is plenty of good, improved land to be bought at \$5 to \$10 per acre, with an abundance of cheap timber available, and other conveniences to match. The people are friendly, and glad to see settlers of all political creeds come among them. Churches and school-houses are springing up all over the county, as if by magic, and the whole region is rapidly filling up with a desirable class of residents. We receive many similar letters from different parts of the South, though this one is exceptional, in welcoming persons of all political creeds, as most of the writers stipulate that only "conservative" people, or those who will say nothing on "politics," are invited.

Sundry Humbugs.—In our raids upon Humbugs, we have frequently set forth that all "Lotteries" are considered as humbugs. From time to time we have shown up the plans upon which they are operated; also how in every instance, where we have taken the pains to investigate any particular ones of the hundreds that come to us every month from all parts of the Union, we have found them to be entirely rotten and worthless. The worst are the *Sandy River humbugs*, for they not only rob one of his money, and in numerous cases out of twenty, of his health, but they also poison the soil by evil teachings and false physiology. Their pamphlets and circulars are generally sent to the young and thoughtless of both sexes, and do mischief by working upon their passions by highly wrought pictures and glowing descriptions. We give a list of some humbug concerns without comment: Lotteries—C. A. Taylor & Co., New York; France Smith & Co., Cincinnati; Alex. Pope, Michigan; Murray, Eddy & Co., Cincinnati, Ohio; Perkins, Fisk & Co., Boston; Alonzo B. Cimbh, Chicago, J. C. French & Co., Buffalo, N. Y., "Pictures." A. G. Judd, Springfield, "Bad Money." Geo. Howard & Co., New York City, Curtin, Hall & Co., A. Weaver & Son, Eureka Print Works, cannot be found at numbers given. Broadway Publishing Co., New York, Books; Hill, Porter & Co., New York, Watches; Chas. Elmer, Williamsburg, N. Y.; T. Seymour & Co., Nassau-st., New York; &c., &c., all belong to the same class.—A few days ago we made a journey to Kelley & Co., of Kelley's Weekly, to get our prize, valued at \$125, said to have been drawn for us at their first distribution, March 12th, 1868. Upon enquiring what the prize was, and if it was convertible into money, they stated that they did not know what the article was, but that they would send it to our address in fifteen days, if we would pay them their 5 per cent on the amount, or, if we preferred, we might call on April 16th, and it would then be opened to our inspection, to be taken at the same rate, if we chose. Wonder if it is Sandy River Petroleum Stock—which they have given in other instances! Has anybody received a valuable prize from A. Kelley & Co., either from their "Grand Gift Concert," or "Illustrated Weekly?" Washington Library Co., or Geo. A. Cooke & Co., Bankers, New York. This "grand award of premiums," this "noble and patriotic cause," in the behalf of Soldiers' Orphans, said to be acting under a charter from the State of New Jersey, is a humbug. R. H. Homan & Co., Astoria, N. Y., we have only to notice as vendors of vile Medical Books, and to put our readers on their guard. Hallett, Moore & Co. can't sell us any of their "Unclaimed Prizes" for \$10.00 percentage, or any other price. We have seen enough of the Sandy River Petroleum Stock.

Wonder if they could tell us something about one "Ellas," of Clark, Webster & Co.—Chas. Elmer & Co. is believed to be *alias* J. Birch & Co., of "Gold Cast" Hamburg-Time-Place notoriety, (see July No., 1867). Julia has lost her \$4.00. We visited the Champion Sewing Machine Co., to see one of their \$4.00 machines, but could neither find the man nor see a machine. These people have always "last stepped out" and left everything in the hands of the "clerk" (G!) who, as a general thing, knows nothing.... Bradford, Van Delf & Co., Broad-st., had better make a lottery, and dole with it, as their present scheme is no better.... Beware of all Lotteries under guise of Pawnbroker's Sales, as Perkins, Fisk & Co., Boston.—N. B. There is a large class of swindlers in this city of which we will take for a type W. L. Wheeler & Co., dealers in Watches, Jewelry, etc. They sell tickets through agents; the choice of one from a lot is \$1.00. The holder of this ticket is entitled to a Watch or Set of Jewelry of some kind, by paying on presentation or through the mail the sum of \$10.00, more or less, and cost of packing, &c. The probability is that a person sending the money to them will get something in return, but not what they are led to believe by their advertisements. This jewelry, which they claim to be "good gold and silver," is neither gold or silver, in any proper sense, but the poorest sort of "sham." Their "Gold Duplex Watches" are not gold at all; their "Diamonds" are not diamonds; their solid gold rings are neither solid nor gold. Jewelry may be very well, if one is able and cares to wear it, but the false display made by this showy cheap stuff is in bad taste.... J. B. Peters & Son, 267 Broadway, Watches, &c. The Post-Office Department, believing these people to be acting under an *alias*, have stopped giving up the letters to their address until they appear in person, and give satisfactory evidence to the effect that Peters is the true name. They have to-day, April 11th, "made trucks" and are nowhere to be found by us. Many people have sent letters and money to J. L. Peters, publishers of sheet music, intended for J. B. Peters & Son. These letters have been returned to the postmaster. Persons should avoid this error, for the first are respectable dealers, and the last named are, as Capt. Cuttle would say, "on the contrary quite the reverse."—The N. Y. Tribune publishes such stuff in the way of advertisements that we do not wonder at an occasional moral spasm in its editorial columns. It announces with much self-gratulation that the Gettysburgh Asylum Swindle has closed its office, and refers those who invested their money, and got no returns, to the editors of those papers who have advertised the scheme. If any one is foolish enough to go to any paper for this purpose, we advise him to begin with the Tribune, as that has done quite as much as any other paper to advertise the Gettysburgh Swindle to the public.

Bees in May. By Wm. W. Cary.

Remove drone comb from the brooding chamber as much as possible, and supply its place with worker comb in movable comb hives. By the use of two or three pairs of combs to a frame fastened by strings, or more expeditiously by small india rubber rings, even small pieces of comb may be turned to better use than in the melting pot. All drone comb in good condition may be rendered useful in surplus boxes. Box hives in which bees have died during the winter, if the combs are good, use for your early swarms—a furnished house is better than one with bare walls. Leave nothing undone in the way of preparation for swarming, and keep a good supply of near surplus boxes. Guard all empty surplus combs against the bee moth by occasional fumigation and inspection. Some parts of the country are so little annoyed by this insect that but little caution is necessary, while in others, the utmost vigilance is required.

The Shenandoah Valley.—"E. T. B."

Vt. Probably there is no better location in the country for grain and stock raising. The climate is healthful, the soil good, and a large number of Northern people have gone in there since the war. The time of lowest prices has probably past in that Valley. Congenial society and security, good schools and churches, are worth paying for.

What Agricultural College?—"A. N."

Westchester County. We are not able to advise you as to the best facilities for educating your son as a farmer. You will find a list of these Colleges in the Agricultural Annual for 1868, with some account of their endowments and course of instruction.

Saw-dust and Tan-bark as Fertilizers.—"A Subscriber."

These substances are used as absorbents rather than for their manurial qualities; nevertheless, both contain enough to make them moderately valuable when decayed. Their chief beneficial action on the soil is mechanical—lightening up heavy soils, and giving sandy ones greater ability to withhold drouth.

Excellent and Unpatented Bee-Feeder.

The bee-feeder shown in the accompanying engraving is one long used by Mr. Wm. Cary, and through him by his friends. As things go, one is surprised that it is not patented, superior as it is to the patented ones with which we are familiar. It consists of a wooden box 9x4, 3 inches deep outside, made of half-inch stuff, tacked together and the joints made tight with paint skids, and painted on the joints inside. There are two partitions (a, b), crosswise the box. The sides, one of which is not represented, are higher than these partitions and higher also than the ends, and these are grooved, so that a pane of glass will slide in and form the cover or top. The partition d does not touch the glass, but a space is left large enough for the bees to pass between. The

glass rests upon the partition b, but does not cover the little bulkhead c, into which the syrup is poured, and which is not accessible to the bees. This partition does not go quite to the bottom, so that the syrup flows under it, and into the middle chamber d. The bulkhead e, which like the other is one inch wide, is the venthole into which the bees enter through a hole which may be seen in the cut, but as the partition rests on the bottom, the syrup will not flow through. The central chamber is the feeding room, and it is divided lengthways by strips of stiff, rough veneering, set in saw kerfs, half an inch apart and not going quite to the floor. These prevent bees falling into the fluid and drowning, as they would otherwise do. Mr. Cary says: "The feeder holds about the quantity of syrup or honey which an ordinary stock will take up in one night, which is the safest time to feed. From its construction it will be seen to fill the requirements of a good feeder, as given in the April number. A modification of this feeder, made partly of tin, is preferable, and made by the quantity is not expensive."

Manuring in the Hill.—"A. C. S."

Maine. It is always desirable to give an early start to corn, or other hoed crops. The principal objection to the old practice of dropping a shovelful of yard manure from the cart tail to each hill, is the great expense for labor. Concentrated composts used in small quantities in the hill are quite as effectual in promoting early growth, and require less labor. A good superphosphate, dropped in the hill at the rate of three hundred pounds to the acre, will pay very well. Unleached ashes also are economical, dropped in the hill or at the first hoeing. Pure bone-dust, one to three hundred pounds to the acre, will make a great difference in the yield of corn. Peruvian guano, mixed with six or eight times its bulk of peat or sifted loam, makes an excellent compost for the hill, and there is no objection to its use, but its high price. Fish guano, mixed with half the quantity of peat or earth, will pay abundantly.

Darwin's Great Work.—The Variation of Animals and Plants Under Domestication.

By Charles Darwin. Authorized edition, with a Preface to the American edition by the Author, and one by Professor Asa Gray. The most perfect edition yet published. The American edition of this remarkable work is now ready. An idea of its scope, though an incomplete one, is given on page 177. The first English edition was exhausted in a week, and a new one called for; in the reprint, Mr. Darwin included some additions, and sent us the sheets as soon as they were printed, together with many additions in manuscript. As these reached us just as our edition was in the hands of the binder, we were obliged to place them on pages prefixed to the work. If the American reader will mark in the text where these additions come in, he will have the work revised by the author up to the latest moment, and a more complete copy than even the latest English edition. Mr. Darwin, not knowing that Professor Gray had made a preface to the American edition, sent us one of his own, which puts his estimate of his own work so neatly and modestly that we chose to insert it. The book presents the most remarkable collection of facts concerning our domestic animals and plants yet brought together, and for this alone it is of the highest value. Not the least interesting portion of the work, to the thoughtful reader, are the speculative views of the author. In these the great problems of inheritance, reversion, influence of external conditions of life, development, and the like, are put in a new light

with remarkable clearness and force. The philosophical results derived from the discussion of domestic animals and plants find an application in all animals, including the human species. While the work will be not interesting only, but useful to every one engaged in propagating animals or plants, it commends itself none the less to the intelligent reader, who will find abundant food for thought, and to men of the medical and other learned professions, who cannot fail to be instructed by its contents. In two neat volumes, of over 500 pages each, illustrated. By mail for \$6—less than half the price of the imported work.

Special Humbug Notice.—With all our care, we have been humbugged ourselves. The wolf sometimes gets the sheep's clothing so nicely fitted that it takes some time to discover him. The wolf in this case is S. G. Sheaffer & Co., Hanover, Pa., and the deceptive fleece is the advertisement headed: "A beautiful puzzle picture," which appeared in the February issue of the *Agriculturist*. The facts are these. The advertisement was offered, the picture was sent to us, and regarding it as a harmless way of advertising a photographic establishment, and at the same time affording some amusement, the notice was admitted. We have since found out that this is all an ingenious way of introducing a lottery scheme. We can only make reparation to our readers by denouncing S. G. Sheaffer & Co. as among the meanest sort of humbugs. As they have gained access to our columns by such representations as the regular humbugs are too respectable to try, we will not insult the "regulars" by putting this interloper among them, but give him all the benefit he can derive from a special notice.

When to Cut Grass.—"P. H." Florida, N. Y.—The tendency in the practice of the best farmers is to earlier cutting. If cut when in full bloom, it makes the sweetest and most nutritious hay. It takes longer to cure it, but its higher value pays for the extra labor.

Lime in Stables.—Bad Doctrine.

"Practical Farmer." A good friend of the *Agriculturist*, in a note on Horse Stables, advises the use of slaked lime, to remove the bad odors. He says, about one quart three times per week will be enough for four horses. "It will stop all offensive smell and destroy all noxious gases." His own experience corroborates his views, and he recommends the mingling of lime with the manure.—This is very unsafe advice. Lime in contact with moist animal substances not putrid, forms soapy compounds which do not readily decompose and throw off bad odors—but when decay has set in, as in the manure pile, lime will rapidly liberate ammonia, the most valuable ingredient of the manure, and it will be lost. So, after a while, also, the soapy compounds will be decomposed, and their ammonia escape. Gypsum is far preferable to lime, but not so active. Sun-dried and sifted loam, thoroughly dry, would, we think, be equally efficient with lime, and certainly no more costly.

Useful Household and Farm Articles.

In our premium list we offer many things pleasing and ornamental, and others really almost indispensable, which can easily be obtained by a little effort, and will continually add to the comfort and prosperity of the farmer. A fine modern plow in place of an old-style, cumbersome one is an addition to the farmer's wealth. Frequent use of a barometer would save many dollars in prompting in the getting of the hay before a rain storm. A good mower should be owned by every farmer. It will save his back and his money. Scales should be used in every house and barn. The proverb says, "Deliver all things by measure and weight," and it ought to be heeded. Have Fairbanks' Standard Scales in the kitchen, and prove which grocery man gives weight, and buy of him. Weigh butter and everything sold, and not *trust* that you are cheated. Weigh the chickens, and see which kinds are thriving and profitable. Have a Fairbanks in the barn, and weigh the pigs, and stock, and grain, and hay, and fertilizers, and thus know what is paying, and what is not. A little practice in this line will pay a hundred fold in money and satisfaction. These articles can be had by helping your neighbors by getting them to subscribe for the *Agriculturist*, which you can do.

A Lady's Experience.

With such an extensive correspondence, we are obliged generally to give the substance of a whole letter in a single line. Had we room we should be glad to give the writer's style, but we cannot often indulge in this. A lady, who signs herself "Mouse-Ear," writes from her place on the Hudson so pleasant a letter that we give it entire, as a specimen of the many pleasant things we might print did space allow. She thus speaks of her last year's experience: "It may well be that many of your lady readers could tell more about the past season, than myself—its floral triumphs, its experimental discoveries, its small leafy disappointments here and there. For I am not rich enough to try all the

novelties of the season; nor always supplied with better skill than my own to bestow among the flowers. What they have, of human care, they generally get from me, and if my fingers are held fast with business or sickness, the flowers must wait. I will not say that they are always the gainers by this state of the case, but I am. I do not wish it changed, on the whole. Nobody knows what a garden is worth, who is a mere spectator there. Looking back over the season, I remember first very gratefully, how much kindness I received from different dealers in plants and seeds, and this ought to be a letter of thanks. It is wonderfully pleasant to have the hard lines of business softened down a little, and to have this thought of kindness come in. I cannot return the favor by large orders,—yet as it is all nonsense that desert roses are *wasted*, so it is often true that powerless thanks and secret good wishes do silently sweeten and freshen the air. All through the season a thought of gratitude hovered about my flowers—from the first purple crocus that bloomed in my window, to the last cox-comb that paled before the frost; from the time when hyacinths and tulips stood, 'ready for duty,' beneath the leafy covering of their heads, until even the sturdy chrysanthemums hung their heads in the November wind. Yes, and at the back of the house as well; for I know what turnip tops look like when their comfortable roots are in the ground, and never even imagine that strawberries grow on bushes. So my thanks cover a good deal of ground, reaching even from New York to Indiana. Did not Mr. A. M. Purdy send me a package of Purple Canes, marked 'good count,' which were certainly numbered off by somebody who quite *lost* count before he got through? Did not my half dozen chrysanthemums multiply in the hands of Mr. Peter Henderson, at a rate to bewilder any ordinary propagator of rare plants? As for Mr. Vick, everybody knows that he uses a sort of packing peculiarly his own; consisting of extra papers of seed, and but that you never sent for, and I don't think you could afford to. But what would my tulip bed have been, without the 'Mariage de ma Fille,' and 'Le Roi Peupin'? And how could I have missed the exquisite 'La Perouse,' and 'Tula Flora,' among my hyacinths?—Or the lovely 'Victoria,' and 'Emperor' Astors?—Or the 'Branching German' Stocks—the fairest, I think, I ever saw?—Or, again, that dainty beauty of a chrysanthemum, with blossoms like balls of the lightest snow, come down through the stillest air? I suppose, Mr. Editor, you have no room for ecstasies, and therefore can admit but little feminine writing at a time; but I wish you'd let me say a word now and then about the season past. I'll try to be practical. You see, there are some things which you (being Editor) can hardly find out. For instance—do you know what a queer thing packing is; and what a *different* thing, in different hands? Mr. Vick's bulbs don't stir on their journey (the box is always too full for that). Mr. Henderson's plants each turned out of the pot with ball of earth entire, and, carefully and separately wrapped up, don't seem to know what has happened to them. My strawberries from South Bend came a little weary of their moist bandage, but no more; my cranberries from Plymouth were safe and grand in their gutta percha silk. So far so good, you will say. But then the packer of small orders at one great firm is not a careful man. My young fruit trees had not much but the box around them, and the roses seemed to be laid in on top to pack themselves—and the roses don't like it; while my *Nisette*, Augusta came looking as if it had but just stepped out of the greenhouse of Mr. Bliss, and was all ready for action. The Rochester roses were fresh and charoling as soon as they could get their wits together, I will say that. Do all your readers know the fragrance of the Hybrid Perpetual, 'Sous le Hêtre' Clay,' or the beauty of the perpetual moss, 'Salob,' or Mme. Planter's cloud of whiteness? Pleasure, civility, kindness,—all those I received from dealers, the season past. Now, I want to ask a question. Has the pretty Daphne Cneorum any special idiosyncrasy that one is bound to respect? Two plants of it last year I had in succession, and both died. And plants seldom do that for me. The individuals were good—from Mr. Henderson: the soil, a generally approved sandy loam. [We have grown Daphne Cneorum, one of the most charming of little shrubs, on almost pure sand and in a very heavy soil, but in both cases it was sheltered from the hottest sun, and we think that too warm an exposure must have been the trouble in this case. Try again.]

Tree Boils.—H. Horton, Delaware Co., Iowa, writes: "Would it be well to enclose a farm with one or two rows of trees, forming a belt as a wind-break? Will it in any way affect the crops? Please tell me what you would advise, and what kind of tree, if any, would be best, and how and when planted."—It would be very well to put a belt of trees around the farm. The effect on the crops would be beneficial, except close to the trees. Some land must be given up to them. For simply a wind-break, we should use Norway Spruce and Austrian or White Pine. If fuel is an object, use Maples;

Sugar is best, but the White grows faster. Put the trees in two or three rows, with the trees in one row opposite the spaces in the other. Let them stand about twelve feet apart in the rows, which should be the same distance apart.

Tree Investigators.—Several have sent us circulars setting forth the claims of a "Tree Investigator," and asking our advice about investing. As we do not know the composition of the article, we cannot speak with any certainty in the case. The circular is calculated to throw doubts on the matter, for it claims too much, and we do not wonder that people hesitate. With our present knowledge we advise our readers to let all tree medicines, "investigators," and like, alone, and try for a while the effect of manure, lime, and ashes, keeping off insects, and giving the whole hand up to the trees.

How Far Does it Pay to Haul Stable Manure?—A correspondent in the Country Gentleman takes exception to a remark, made in our February issue, that "four and a half miles is a long way to cart stable manure." We are glad of this, both for the information he gives, and for the opportunity it affords to express more fully our views upon this point. He says of the farmers in the neighborhood of Philadelphia: "They do not think fifteen or eighteen miles too far to haul stable manure, even at this enormous expense (from five to seven dollars a ton); and it is my experience, that the farmers who do it are the men whose farms are the most highly improved; the men who have the most money for improved machinery;—and who are altogether the best of among us." I could mention one of my acquaintances, who last year, of a farm of eighty-five acres, sold \$1500 worth of hay in the Philadelphia market, besides keeping a large stock on the place. If it pays us to send hay and straw fifteen miles to market, it must pay to bring back a load of stable manure for every such load of hay or straw that goes off the farm. A ton of hay or straw sells for \$35 to \$50. A ton of manure brought back on the place costs \$5 to \$7. Who will say that the farmer who makes this exchange is not making money, and enriching his land? We certainly should not say it, for he has either to carry manure as his return load or go home empty. And yet, we think, he might do much better than to carry the stable manure, nine-tenths of which is carbon and water—articles to be had on his farm for the mere labor of handling. According to Dr. Voelcker's analysis, the mixed manures of the yard contain only \$4 worth of ammonia, phosphoric acid, and potash, per ton, and these are the only constituents usually taken into account in estimating the value of a fertilizer. These articles, which do the work of fertilizing, can be had in a much cheaper form, in concentrated fertilizers, and if a man has to cart manure even three or four miles, we claim that it is much more economical to buy and cart them, rather than stable manure, so large a part of which is worthless. In a ton of fine ground fish guano, you have by analysis as much fertilizing matter as there is in fifteen tons of stable manure, and it can be bought in quantity for nearly a third less than the stable manure at \$4 a ton. In a ton of Peruvian guano you have nearly a third more in value. In bone-dust, and in a good superphosphate, you have fertilizers in a concentrated form. If carting stable manure to the farm, as a return load, pays so well, would not carting the same value in one-tenth of the bulk or weight pay a great deal better?

Feeding Corn Meal to Milch Cows.

The types made us say last month, that it would pay to "feed milch cows all the corn meal they would eat." What we wrote was that with butter at 40 cents a pound, it would "pay to feed cows all the corn meal they will eat and convert into butter." It would be a great mistake to give milch cows or fattening beasts all the corn meal they would eat. It would be very likely to kill them.

There is far less need of cautioning most people against feeding too much than feeding too little. There is, however, a disposition on the part of many who feed meal to cows, to give a liberal supply for a short time, and then to stop altogether. The meal disappears rapidly, and they are frightened at the expense. With cows worth \$100 apiece and butter 40 cents a pound, there can be no doubt of the advantage of liberal feeding. But it must be done systematically. There is a very general opinion that corn meal is "too heating," and that it will dry up a milch cow. There can be no doubt that corn *is* heating—that is to say, it contains a large proportion of starch and oil. And this is just what we want for the production of butter. It is possible, however, that when corn meal is fed in large quantity, there may be a deficiency of nitrogenous or cheese-forming material. This is not likely to be the case when the pasture or the hay contains considerable clover. Clover contains much more nitrogenous matter than timothy and other grasses, when

cows are fed on timothy and a liberal allowance of corn meal, there may be an excessive quantity of fat-forming matter in the food. In such a case, pea meal, or oil-cake, or shorts, might be substituted for a part of the corn meal. Give a quart of corn meal and a quart of pea meal or oil-cake a day, or a quart of corn meal and two quarts of shorts. But when the cows have considerable clover there will be no danger in feeding two quarts of corn meal a day all through the summer. It will not dry up the cow, or if it does, such a cow is not worth keeping in the dairy. Better fat her and sell her for beef. We have never yet happened to meet with a cow that can be dried up with two, three, or four quarts of corn meal a day, when fed systematically through the whole year. If we could be sure of getting forty cents a pound for butter it will certainly pay to feed all the corn meal our cows will digest and turn into milk. Commence with a quart a day, and gradually increase it as the milk increases. Let the cows have access to fresh water at all times, and salt them regularly once a week, but not in excessive quantity. Treat them gently, care occasionally, milk regularly, and strip clean. Give good pasture or other succulent food, and if corn meal, with a little pea meal or oil-cake, or shorts, dries up the milk, we should like to know the fact.

Culture of Field Peas.

We have for many years advocated the more extensive cultivation of peas and beans, as a means of enriching the land. They contain twice as much nitrogen as wheat and corn, and consequently make rich manure. A crop of peas of forty bushels per acre contains in seed and straw about 130 pounds of nitrogen, while a crop of wheat of forty bushels per acre, in seed and straw (calculating the straw to weigh as much as the grain, which, we think, is about the average in this climate), contains about 57 pounds of nitrogen. Peas, Beans, and Clover, are all leguminous plants (i. e., belong to the pea family) and all contain a large proportion of nitrogen. When consumed on the farm they afford rich manure. The manure from a bushel of peas is worth as much again as the manure from a bushel of corn.

Where peas can be grown and consumed on the farm, therefore, they are eminently a renovating crop. On the other hand, if sold, they remove more fertilizing elements from the farm than a crop of wheat or barley. Peas do well on sod land, and are generally grown as a crop to precede winter wheat. On an old, tough, timothy sod this is not a good rotation. The peas may do well, but the sod is seldom sufficiently rotted to produce good wheat. On a two or three year old clover sod the practice of sowing peas to be followed by wheat is a good one, provided the land is rich enough, or can be manured for the wheat. If the peas were drilled in rows a foot apart, and we had a good horse hoe, that would hoe ten or twelve rows at once, there can be no doubt that peas might be extensively grown on wheat farms, to great advantage—provided always that they are fed out and not sold. If not sold, it is very important to secure a large growth of vines, so that they may smother the weeds. We have had wheat after a heavy crop of peas, that was as clean as if the land had been well summer-fallowed, and far cleaner than it frequently is after a poor, neglected summer-fallow. But on poor, dirty land, a crop of peas sown rather late in a wet spring, followed in a week or two by such a drought as we had last season, is about the worst preparation for wheat that can be adopted. The fact is, all our renovating crops, such as peas, beans, clover, turnips, and other roots, need clean, rich land, and the best of culture. Occasionally, in a wet season, a large crop is obtained on poor, badly cultivated land, but this is the exception. Generally such treatment results in half a crop of peas and a full crop of weeds—requiring more labor to harvest them and leaving the land foul. It is best to sow peas with a drill, but if this cannot be done, take great pains in plowing the land, and sow the peas on the furrows without previous harrowing. The seed will roll into the hollows between the furrows, and the harrow, passed lengthwise of the furrows, will cover them. Share's harrow, with steel teeth, is a good implement to cover peas. As the object is to get a heavy, smothering crop, it is well to seed thick, say three bushels per acre, or if large peas, three and a half. The small Canada cropper is the kind usually raised in Western New York. Fortunately the pea bug attacks our peas and renders them unsalable. They can only be mixed for the purpose of feeding out on the farm. There is nothing better for hogs, especially in connection with corn. If fed out by the middle of November the bugs do comparatively little damage. Many farmers feed them to pigs, straw and all, without thrashing. This will answer very well while the crop is green, and the pigs will eat nearly all the vines, but when the crop is matured it is a wasteful and slovenly practice. If the peas are properly cured, the straw, especially if a large crop, makes excellent fodder for sheep, and should be carefully saved.

Don't Let Potatoes "Mix in the Hill."

"Do potatoes ever mix in the hill?"—Potatoes are very apt to be mixed in the hill, and it requires constant care not to suffer loss in this way, for mixed potatoes never will bring so high a price in market as they would were the kinds separate. The mixture always takes place either *at or before planting, or after digging.* The question may be discussed till doomsday with some people, and never be decided, for the simple reason that some people are exceedingly careless with their seed potatoes. It is not unusual to see, that the soil and manner of culture, manure, amount of weeds, etc., have a decided effect upon the external appearance of the potatoes. These things affect the tops, the roots, the tubers externally, and their internal character. The color and markings are perhaps least affected; the form is subject to considerable change; the texture of the skin to still more; and it may be and probably is true, that after cultivating a variety for many years under similar circumstances, a decided change of appearance and character may be established. This, however, very rarely occurs, and the possibility of such a thing may be entirely disregarded in planting potatoes, except to throw out any peculiar looking ones which may be noticed when the seed is cut. Different kinds of potatoes may be planted in contiguous rows, as well as otherwise. In fact, this is the best way of comparing the productiveness of different varieties—two rows across the field being planted with each kind, repeating the same kind two or three times, to give all an even chance.

Why Heap up Manure ?

The old-fashioned practice of composting all the contents of the yard, the sties, and the stables, is attended with much labor, and is often imperfectly done, or neglected altogether, from want of conviction of its utility. There are the same materials before and after the heaping, the farmer reasons; why will they not benefit the land as much in the one condition as in the other? The question is fairly put, and demands an answer. There are not necessarily the same materials in a compost heap before and after fermentation. If the contents of a yard were swamp-muck, peat, surface loam, various kinds of straw, sea-weed, kelp, and the manure of horses, sheep, and cattle, and if to these was added fresh sty manure, or night soil, or a few bushels of lime or ashes, the whole mass would be thrown into fermentation, and new chemical combinations would take place, and the new compounds would be more immediately available for plant food. Just how much the mass would be benefited by these new combinations we may not be able to state, but no intelligent farmer has any doubt of the higher value of fermented compost, for ordinary farm purposes. Another great advantage from this work is the increased fitness of the manure. Stable manure is often carried out and spread in great frozen or dried lumps, and in this condition is plowed into the ground. It doubtless benefits the soil in this condition, but the roots of plants are a long time in getting at their food. We think it pays to fork over a manure heap twice, and give it the full benefit of a second fermentation. The hay and straw are all broken down by this process, and all the materials of the mass are thoroughly mixed. Much of the immediate effect of manure depends upon its fitness. The time usually allowed for composting is quite too

short. The greatly increased effect of well-rotted manure has led some to wish for a whole year to complete the process. This is one of the points that we should like to see accurately determined on an experimental farm. The liquefying of all the yard manures is doubtless better than any commination that we can attain by rotting, but the necessary apparatus for doing this, and applying it economically to the fields, requires more capital than most farmers have to invest. Thorough composting is within the means of all, and would always pay.

The Jerusalem Artichoke.

BY JULIUS MEYER, EGG HARBOR CITY, N. J.

Having cultivated the Jerusalem Artichoke (*Tobiananber*, in German), with advantage during a number of years in the cold climate of Northern Pennsylvania, on the top of the Alleghany Mountains, I am enabled to complete the report of your correspondent from Rome, Ga., in the number for March. The Artichokes must be cultivated on a field by themselves, out of the regular rotation of crops, because they are difficult to exterminate; they may remain, however, on the same field any number of years, if they are only manured every second or third year. Although they give a good return on poor soils, they will pay the better the more manure they get; I harvested, upon an average, half the number of bushels more than I did of potatoes on equally manured and cultivated fields. They had the advantage of not being touched by the rot, while at the same time the third part of the potatoes were rotten. The soil was a sandy clay, containing no lime, but considerable iron,—a soil which may be classified as third rate. My method of cultivation was as follows: I plowed the field in the fall, cross-plowed in the spring as soon as the ground would admit, which generally did not occur there before the latter part of April, harrowed, and then with a one-horse plow made furrows 4 inches deep at 3 feet apart. I laid the Artichokes about 20 inches apart in the furrows, and covered them with the plow. I planted once in the fall, but found the soil too much settled in the spring; therefore I prefer planting at the latter time. About a week or a fortnight after planting, (according to the weather), I went over the field with a light harrow, to loosen the soil and kill the young weeds. During the summer I went through with the cultivator three times. In the first week of October the stalks were cut with a sickle and put in shocks; in the third year a cradle may be used to advantage, where they are dense and the stalks not too stout; the leaves turn black while drying. Lacking room in my barn, I left the stalks standing in the field, and hauled them in whenever they were needed for food; if they are put together in large shocks, when dry and topped well, they may be left in the field a long time without spoiling. I fed the stalks without cutting them up, and if not given in too large quantities at once to the cattle, they would not leave a particle of them. Whenever they had the choice they preferred them to corn stalks, although the latter were cut before the frost killed them. The Artichokes may be dug any time during the fall or winter, but as the frost does not spoil them in the ground, I left them always in until spring, because, being fresh and juicy, at that time they are of great value as food for new milch cows, causing them to give a good supply of very rich milk. Horses, old and young cattle, sheep, and swine, all devour them with avidity; horses fed with them need but little

oats. As soon as the ground was sufficiently dry in the spring I commenced plowing them out; they were picked up clean; some time afterwards, before they commenced growing too much, harrowed once or twice and picked up again, and yet there were always enough left in for seed. In the second year the cultivation in rows must generally cease; the dense growth keeps the weeds down pretty well. In the third year and afterwards, they frequently grow so dense that large quantities of feed can be pulled out during the early part of summer. After the third year, when the knolls are plowed out, the soil should be manured heavily; the more frequently this is done afterwards the better; wood ashes have a good effect. I consider the Artichokes as nutritious as the potatoes; they contain but little starch, but in place of that more saccharine matter than even the sugar beet. I like to eat them raw, but do not care for them boiled; tastes differ, however. Let me shortly recapitulate the good qualities of the Artichoke: 1. They grow in all dry soils. 2. All kinds of cattle devour them eagerly. 3. They are not subject to the rot. 4. The frost does not spoil them; therefore they cause no expense, like potatoes and turnips, to keep them during the winter. 5. They need not be planted anew every year and require but little culture after the first year. 6. The stalks are consumed by horses, sheep, and cattle; when dry, they may be used as fuel, particularly for heating baking ovens; when cut up, they give good bedding for swine, as the pith in them will retain a good deal of urine.

I know of no plant raised for the purpose of food for cattle, which gives so much net profit as the Artichoke, and I think every one having cattle to feed ought to have at least one acre planted with them; as soon as I get my new farm here cleared, I shall devote several acres to the cultivation of Artichokes.

The Giraffe—Mending a Broken Jaw.

A delicate surgical operation is always interesting and instructive; but when such an one is performed upon an animal like the Giraffe saved from the burning of Barnum's Museum, an animal whose history and natural history are so interesting, and whose money value to its owners is so great, it is certainly worth while for us to chronicle it particularly. The Giraffe is perhaps more familiarly known as the Camelopard (pronounced improperly camel-leopard). The Latin name is *Camelopardalis Girafa*, the generic name meaning the "spotted camel," as leopard means the "spotted lion." It is a ruminant animal, closely allied to the camel, antelope, and deer. It has cloven hoofs, and peculiar, permanent, bony horns, covered with skin and hair. These animals come from Africa. They are easily and perfectly domesticated, and breed readily in confinement. They have prehensile tongues, with which they can pick fruit, leaves, etc., above their heads. Adult animals stand from 14 to 18 feet high, and eat about as much as a pair of oxen. The beautiful specimen of this wonderful species alluded to has doubtless been seen by great numbers of the readers of the *Agriculturist*, as it has been for five years the property of its present owners; it was valued by them, we understand, at \$20,000, or more. It is a female, and was calved seven years since at the Zoological Gardens in Regents Park, London. She was rescued from the fire with great difficulty, falling upon the steps, and in the fall breaking her under jaw, and being considerably burned before she was gotten away. She has

been under the care of Dr. A. Liautard, of the New York College of Veterinary Surgeons, who gives the following description of her case:

"I found her on the afternoon of the day of the fire, (Tuesday, March 3d), then suffering from a large but superficial burn of the right hip, and also from a fracture of the lower jaw. This fracture, on examination, proved to be transverse through both branches of the lower jaw bone, where they are quite close to each other. The animal was removed to the infirmary of the college on the following Thursday. In the afternoon she laid down; being then secured by means of ropes and hobbles, and covered with a heavy canvas, she was kept down, and with the very kind assistance of Prof. John Gangee, of London, and Prof. A. Large, of Brooklyn, I reduced her fracture in the following manner: Two holes were pierced with a very fine drill, through both sides of the jaw, one in front of

Fig. 1.—HEAD OF GIRAFFE.

the fracture, the other behind, as shown in fig. 2. A broad piece of thick sole leather was prepared, which may be seen in fig. 1, the central part to rest on the jaw, the ends extending upwards on each side, a little behind the corners of the mouth. A silver wire was first introduced through the leather, then passed through the jaw, through the other end of the

Fig. 2.—JAW OF GIRAFFE.

leather, and back again, as shown in fig. 3. The ends were secured by several twists, and the fractured ends of bone brought closely in contact. The narrow space between the two branches of the bone prevented my making two separate sutures, and at the same time favored the operation in opposing lateral displacement. A piece of webbing passed through eyes pierced

Fig. 3.—HORIZONTAL SECTION OF JAW.

in the leather was fastened over the nose, and then round the horns, to prevent the bandage from slipping down, and pads of oakum were put near the skin, where necessary, to pre-

vent chafing. The operation lasted 20 minutes; she stood it quietly, and was afterwards allowed to get up. She has been fed with thick oat-meal gruel and milk, and her general condition has been improving every day. The burn has been treated on general principles, and the chances are that she will soon be able to eat full rations."

This operation, which, up to the time of our going to press, promises to be so successful, might have been equally well performed upon a horse or an ox, and suggests a ready means of bringing the parts of a fractured bone together, applicable under many similar circumstances.

The Corn Crop.

There is not the shadow of a doubt that there will be an immense breadth of corn put in this year in all parts of the United States. The prices which have prevailed, both East and West, would be stimulus enough, were there no other reason, and there are many. Facilities for transportation have increased; the dullness of trade and manufactures has reinforced the ranks of tillers of the soil; labor is less expensive; and every thing tends to induce extensive planting of our great staples. In regard to preparation of the soil, we earnestly advocate thoroughness, and abundant manuring. Who ever saw land too rich for corn, if properly cultivated? The plowing should be deep; the manure incorporated with the soil; and the harrowing and tillage previous to planting, in proportion to the amount of weed seed in the land, or grass and sorrel which repeated harrowings or rakings are required to eradicate. The first of May should see the land plowed, especially if it is given to being weedy, and if the weather is warm and the weeds start, about once a week the harrow should be thoroughly put over it, and across it. The land gains enough to pay for the extra labor, and there may be multitudes of weeds destroyed in the seed-leaf. Tillage by horse-power, before the crop is planted, may be much more thorough than any subsequent working it can have, except careful hand-hoeing. In regard to what kind of corn to plant, we say take the earliest that yields good crops. Select medium-sized ears, well filled out, compact, even-rowed, and close at the butts. As a rule, rather small-stalked kinds are preferable—they may be planted closer, and do not shut out so much sunlight from the soil, and when the proper distance to have the plants or hills apart is known and followed, we think they yield the largest crop. Be sure that the variety will mature early for your latitude—then one fruitful source of disappointment and loss is shunned. As to planting, we say be in no hurry, provided the corn is just coming up by the first of June. Much excellent corn is raised every year which is planted after the first of June. It is far more important to have an early kind, and to have one crop of seedling weeds killed, than to plant before that date. This observation applies with especial force to the country north of the latitude of Washington. The warm weather which reaches us in June above that parallel comes earlier to the Southern States. Whenever it may come, corn waits for it—and we see little vigorous growth of this crop before we have hot summer weather. The rows should be put so far apart that as much as possible of the tillage may be done by horse-power. This is the limit of closeness, and cannot practically be less than three feet, except for dwarf varieties. Plant in *drills*, dropping the kernels so that they will average about two to the running foot.

This will be an allowance of fully one-third for worms, etc., which leaves enough, and ordinarily too much, to stand. It must be thinned out as soon as danger from the cut-worm and grub has passed. Summer cultivation comes in June, and until then we will defer its consideration.

Pure Water for Hens and Chickens.

Pure water is essential to the health of chickens. It should be changed frequently, and no dirt allowed to contaminate their vessel. We have been annoyed not to be able to set a shallow vessel of water close to the coop, so that the old hen can drink and not have it filled with dirt from the floor of the coop, thrown into it by her scratching. This is supposed to contain the eggs of the gap-worms, which are taken into the throats of the chickens with the water, either before or just after hatching. Whether this view is true or not, pure water is scarcely the less a great desideratum, and it has been an

PURE WATER COOP.

important problem how to secure it.* If we are not mistaken, this question has been somewhere proposed to our readers, but the method exhibited in the accompanying engraving has suggested itself to us, and has been carried into effect thus far with so great satisfaction that we describe it to our readers. The water dish is set at the side of the coop, and a hole is cut so that the hen may put her head through conveniently and drink. If she scratches hard enough to throw dirt through the hole, in all probability it will overshoot the water. We may find it necessary after the hen learns where to go to drink, to tack a light curtain of cloth partly over the hole. We think this plan will prove effectively useful in preventing the gapes.

Varieties and Variation.

That animals and plants vary, i. e., the child is not always in all respects like its parent, must be admitted by all. That the peculiarities which mark this variation may be transmitted, and that by breeding from animals possessing desirable peculiarities in the most marked degree, a race may be so well established that it is quite certain to "come true every time" is known to every stock-breeder and every intelligent farmer. How great these variations, what a difference from the wild type of animals and plants our domestic ones present—a difference caused by man's agency in selecting for perpetuation those possessing qualities best suited to his use or his fancy—few are aware. It remained for Mr. Charles Darwin, the distinguished English naturalist, to bring together in his recent work, on

the "Variation of Animals and Plants under Domestication," a host of the most interesting, we might almost say startling, facts bearing on these points. One cannot peruse this book without wonder at the industry that has brought together so much widely scattered material, without being impressed with the wonderful power that man has, often unconsciously, exercised over the brute creation, in modifying not only their habits, but their very structure, and without gratitude to the Creator that He has so formed the creatures over which He has given man dominion, that they should be not only subject to his will in the sense of subordination, but to his will in adapting themselves to his uses. The laws which seem to govern these variations, the effects, good and bad, of crossing and close breeding, inheritance, influence of food, climate, etc.,

and all matters relating to the subject, are discussed with a clearness and thoroughness, that have made the book, to us, not only instructive but fascinating. It is a book to be studied, and thought over, and referred to. We

for man, and reciprocally man has done a great deal for the hog—"A fellow-feeling makes us wondrous kind." Look at the portraits in figure 1. The upper head is that of a Wild Boar—not altogether unlike some tame ones we have

A comparison of these skulls shows how much the domestic races have departed from the wild type, in shape of the bones of the head, length and character of the bill, and the like.

Mr. Darwin has much that is interesting

to say about fowls, the numerous breeds of which he considers to have originated from one wild species. Strange, indeed, that a species should have varied so greatly as to give us the tiny Baniam and the enormous Cochin, the Black Spanish, (fig. 3,) with its immense single comb and white face, and the Hamburg, (fig. 4,) with its flat, curiously pointed, and marked comb!

It is not our purpose to review Mr. Darwin's book, for our limits would not allow of that. We can only say, that no one has discussed the subjects of which he treats with so much ability. He has given us a store of facts, and the explanation of the

wonderful variations in our domestic animals and plants that seem to him indicated by these facts. In the above we have omitted all reference to Mr. Darwin's facts and investigations with respect to plants. Some of these are

Fig. 3.—BLACK SPANISH FOWL.

Fig. 4.—HAMBURG FOWL.

Fig. 1.—HEADS OF WILD BOAR AND YORKSHIRE HOG.

are tempted to give a few of Mr. Darwin's figures, as illustrations of some of the remarkable instances of variation, and in doing so we select those that are within the observation of most of our readers. The hog has done a great deal

seen—while the lower is from a photograph of "Golden Days," of the Yorkshire breed. What a difference in the development of the head—a difference which is equally marked in the legs, and in the whole structure of the animal. When man found it inconvenient to go out and shoot wild pork, he began to grow it in pens. Man had a fondness for ham and good pork, and he bred from animals likely to furnish these, while the pig, not being obliged to seek its own living, had less use for snout and legs. Thus the two, man and pig, unconsciously, it may be, produced the result here shown. We not only get more pork from the carefully bred animals, but the animal gets less head. In the common breeds the head is in length to that of the body, as 1 to 6, while in the highly cultivated races it is as 1 to 9, and even 1 to 11; and so with length of legs, size of hams, character of hair, skin, etc.

Cattle, horses, sheep, dogs, and other quadrupeds are treated in a most interesting way, and many curious points in their history developed. Upon birds, especially upon pigeons, Mr. Darwin is very full. Pigeons are bred so largely for "fancy," vary so widely, and in so few generations, that they afford striking illustrations of the variation produced through the agency of man. The fine group of pigeons we gave last month shows some of the widely differing forms. These are, however, but few among the many breeds known to fanciers, and as unlike as they are, they are all traced back, with considerable certainty, to the wild pigeon of Europe. In a long course of breeding, these varieties have departed widely from the original type, and from one another. Not only do they differ in particulars that are noticeable at sight, but the skeleton is changed in various ways.

Figure 2 shows the skulls of some of the varieties. A is the skull of the Wild Rock Pigeon; B, the Short-faced Tumbler; C, the English Carrier; and D, the Bagsdotten Carrier.

Fig. 2.—SKULLS OF PIGEONS.

from experiments of his own, developing some exceedingly curious facts in fertilization, and attended with results of great interest to the botanist and the general cultivator. Some may not agree with his views, but none can deny the force and fairness with which they are put,

Walks and Talks on the Farm.—No. 53.

Do you recollect a conversation we had about the system adopted by the Herkimer County dairymen, of breeding and feeding cows solely for milk, without any reference to their value for beef when they were no longer profitable for the dairy? I endeavored to show that at the present price of beef it would be better to keep a cow five years and then sell her for beef, and get another and keep her five years and sell her also for beef, than it was to keep one cow ten years until she was "used up" and of little value except for the hide. In the latter case, we figured a total profit of \$210 in the ten years; and in the former case, a profit of \$125 in five years on one cow, and consequently a total profit on the two cows during the ten years of \$250. (See *Agriculturist* for Feb., p. 54.)

A Cortland Co. farmer writes that I have made a mistake—that the profit on the old cow is \$210, and on the young cow \$125, and that consequently the present system of keeping cows until they are used up is more profitable than of turning them off at an earlier age for beef. He overlooks the fact that in the latter case we have two cows instead of one. The profit in the ten years is just double what he supposes. There is no mistake, except that the profit on the young cow is \$130 instead of \$125, and consequently \$260 instead of \$250, a mistake which adds ten dollars to the strength of the argument. I was very careful not to overestimate the profits of the new system. I think it would be easy to show greater advantages than those which we claimed. With beef at famine prices it seems a pity to keep a cow until there is nothing left of her but skin and bones.

The same writer says: "Some other ideas of Walks and Talks in the February No. differ from what I believe dairymen around here hold to, as when he says: 'It takes more food to produce a pound of cheese than a pound of beef.' I cannot say he is mistaken, as I have not tested it." He then asks if the cow that produced 600 lbs. of cheese in a year would produce more than 600 lbs. of beef with the same food. Probably not. But a cow with equally good digestive organs, that is so constituted that all the food shall be changed into beef instead of into cheese, will gain a good deal more than 600 lbs. in live weight.

It is an extraordinary cow that will produce 600 lbs. of cheese in a year. Such a cow must necessarily eat a large amount of food, and of the best quality, and the probabilities are that at the commencement of the season she is in high condition, and as thin as a shadow at the end of it. In other words, although the season may not last over eight months, the food of the whole year is used to produce the 600 lbs. of cheese, and the calf. The flesh and fat she had stored up during the winter would all find their way to the milk-pail before the end of the summer. Mr. Sheldon's Short-horn calf weighed at 6 months old, 652 lbs.; at 9 months old, 928 lbs.; at 12 months, 1,216 lbs., and at 18 months, 1,806 lbs. Of course this is an extraordinary animal—but so is also the cow that will give 600 lbs. of cheese in a year. Both have splendid digestive organs, and both unquestionably had all the food they could digest and convert into beef or cheese. Had this animal been killed at twelve months old, he would have dressed at least 800 lbs. And you must recollect that in the case of the cow the machine for converting the food into cheese is already made—and it required at

least three years feeding to get the machine in running order. But this yearling Short-horn made nearly the whole of his own machine as he went along, and turned off 800 lbs. of beef.

But of course such facts as these prove nothing. They are not comparative. The main reason for supposing that a pound of cheese requires more food for its production than a pound of beef is this. Beef is derived from the blood of the animal, and so is cheese. Their origin is identical, and composition very similar. But there is far less water in cheese than there is in beef.

A first-class American cheese analysed by Dr. Voelcker contained in one hundred parts:

Water.....	27.29
Butter.....	35.41
Casoin.....	23.87
Milk sugar, lactic acid, and extractive matters.....	6.81
Mineral matters, (Ash).....	5.22

Laves & Gilbert give the composition of the carcass of a fat calf, a half fat ox, and of a fat ox:

	Fat calf.	Half fat ox.	Fat ox.
Water.....	62.30	54.10	53.50
Fat.....	16.60	22.60	34.80
Nitrogenous compounds.....	16.60	17.90	13.00
Mineral matter (Ash).....	4.48	5.56	4.55

Look at these figures and tell me which would require the most food to produce it, a hundred pounds of cheese or a hundred pounds of beef? Take the half fat ox, (which is the condition in which most of our cattle are slaughtered), and it will be seen that the beef contains *twice* as much water as the cheese. If there was no water in the cheese, and no water in the beef, the composition per cent would be as follows:

	Cheese.	Beef.
Fat or Butter.....	43½	49
Nitrogenous compounds or Casoin.....	33½	38½
Sugar, lactic acid, &c.....	8½	none.

The beef contains a little more fat than the cheese, and some 3 per cent more nitrogenous matter, but the cheese has 8½ per cent sugar, etc.

Looking at these figures as they stand, one would say that it took about as much food to make a pound of dried beef as a pound of dried cheese. But we do not sell beef and cheese in this chemically dry condition. As ordinarily sold, the cheese contains only about half as much water as the beef. The cow that makes 600 lbs. of cheese in a year has as much fat and nitrogenous matter extracted from her blood as would make about 900 lbs. of beef. And that this is all derived from the food directly or indirectly, no sane man will question. It takes, therefore, more food to produce a pound of cheese than a pound of beef.

The same writer thinks it a mistake to suppose "that enriching the land either by hoeing or manuring, causes it to grow richer grass." He thinks "2 tons of hay from two acres is worth more than 2 tons from one acre." Sometimes it is, and sometimes it is not. It depends on the character of the land and on the nature of the grass. Two tons of timothy from two acres of upland would be worth more than two tons of sedges, weeds, rushes, and coarse grass, from one acre of rich, swampy land. So far he is right. But this does not touch the point. Take a field of good, dry upland. Let half of it be enriched by thorough cultivation and manuring, and the grass on this half will be sweeter and more nutritious than on the other half. Top-dress an acre or two of pasture land with some rich, well-rotted manure. It will bring in finer grasses and thicken the sward, and the cows will very soon tell you which grass they like best. They will not touch the other grass as long as a bite can be obtained on the top-dressed portion.

This man is hard to please. He thinks every-

thing I said in the February No. is "faulty." He cannot see why high farming is any more necessary or profitable on high-priced land than on cheap land. He thinks "good farming pays the best anywhere." But we were not talking about good farming, but high farming. If he had written: "My idea is that high farming pays best anywhere," he would have met the case. And if he had thought a moment, he would have seen that this proposition is not true.

Good farming is sometimes high farming and sometimes not. Plowing under a crop of clover for wheat is frequently good farming, but it is anything but high farming. Summer-fallowing is often the best and cheapest way of cleaning and enriching land, and in such a case is good farming, but it is never high farming. High farming would summer-fallow the land and have a heavy crop growing at the same time. The market gardens around New York afford excellent examples of high farming. Read Henderson's interesting book on "Gardening for Profit," and you will get an idea of how much produce can be raised on an acre of land. They employ a working capital of \$300 an acre; underdrain thoroughly; use from 50 to 100 tons of manure on each acre every year; have two, three, and four crops in succession during the season on the same land; never let a weed show itself; pay from \$100 to \$300 an acre rent and taxes, and make a handsome profit besides. This is high farming.

They have to pay an enormous price for the land, and they *must* farm high, or not farm at all. They could not afford to let their land lie idle a year in order that they might summer-fallow or plow under a crop of clover. Where land is worth only \$50 an acre, we can afford to adopt a slower method of enriching it than when it is worth \$500, or even \$200 per acre.

He quotes my remark: "You can afford to pay more for manure that will double the crops on land worth \$150 per acre, than on land worth only \$50," and asks "Why so? If doubling the crops on good farms is profitable, why not on poor ones equally so?" Why not stick to the proposition? He should say, "If doubling the crops on land worth \$150 an acre, by using 400 lbs. of guano costing \$20, is profitable, why not on a farm worth only \$50 an acre?"

Had he put the question in this form he might have discovered a reason. You can afford to spend more time in order to double the interest on \$150 than to double it on \$50. Mark you, I did not say the Herkimer Co. dairy farms were worth \$150 to \$200 an acre. I only said *if* such was the case it would pay better to adopt high farming than it would on land worth only \$50 per acre. I can afford to spend \$30 an acre in underdraining my farm in Western New York, but it is very questionable whether \$30 an acre can be profitably spent in draining a farm in a section of Iowa, where good, dry land could be bought for \$10 an acre. Where corn is worth \$1.25 a bushel it may pay to expend 25 cents a bushel in grinding and cooking it for the hogs, but where corn is worth only 35 or 40 cents a bushel it would hardly pay to expend 25 cents a bushel for the purpose.

I have just sold 15 tons of straw to the paper men for \$150—they drawing it themselves—and the Deacon says he met Pearl, the butcher, yesterday, who told him that he "was going to get some one to write an article for the papers giving me 'Hail Columbia' for preaching one thing and practising another."

Pity the sorrows of a poor old editor! I do not think it is a good plan, as a general rule, to

sell straw. Better buy oil-cake, and feed stock enough in the winter to consume all the straw, hay, corn stalks, etc., on the farm. This is what I preach, and this is what I practise as far as I can. I have laid out over \$3000 in the purchase of oil-cake, bone-dust, and other manures, during the last four years, and have not sold, to the best of my recollection, a ton of straw, or hay, or corn stalks before. To feed nothing but straw to stock is bad economy, and to rot it down for manure is no better. Straw itself is not worth over \$3 per ton for manure. And as one ton of straw will make in the spring of the year four tons of so-called manure, and as it costs about 50 cents a ton to draw it out and spread it, it only nets you, when fed out alone or rotted down, about \$1 a ton. I had about 30 tons of straw. Fed out alone or rotted down it would make 120 tons of manure. After deducting the expense of filling, hauling, and spreading, it nets me on the land, \$30. Now sell half the straw for \$150 and buy three tons of oil-cake to feed out with the other half, and you would have about seventy tons of manure. The manure from the fifteen tons of straw is worth, say \$15, and from the three tons of oil-cake, \$60, or \$105. It will cost \$35 to draw and spread it, and will thus net on the land \$70. So far as the manure question is concerned, therefore, it is far better to sell half your straw and buy oil-cake with the money than to feed it out alone—and I think it is also far better for the stock. Of course, it would be better for the farm not to sell any of the straw, and to buy six tons of oil-cake to feed out with it, but those of us who are short of capital must be content to bring up our land by slow degrees. Last fall, if I could have met with a nice thrifty lot of grade short-horn steers, coming three years old, and had had the money, there can be little doubt that it would have paid to have given six or seven cents a pound for them, and bought oil-cake to feed them in connection with my coarse fodder and clover hay. They would have brought ten cents a pound this spring. They would have paid handsomely for the oil-cake and hay, and something for the straw, besides furnishing a grand lot of rich manure. But even if I had had the money, the grade short-horns are not to be met with in this section, and so I did the best thing I could. If my oil-cake and clover hay manure does not tell next year on the wheat crop, I will revise my calculations as to its value. In the meantime, I have no sort of doubt that, after deducting the expense of drawing it out, oil-cake and half clover hay and half straw will make manure that is worth at least *six times* as much money as manure made from straw alone.

Geddes and I do not differ as much as you suppose. In fact I do not believe we differ at all. He has for many years been an earnest advocate for growing clover as a renovating crop. He thinks it by far the cheapest manure that can be obtained in this section. I agree with him most fully in all these particulars. He formed his opinion from experience and observation. I derived mine from the Rothamstead experiments. And the more I see of practical farming, the more am I satisfied of their truth. Clover is unquestionably the great renovating crop of American agriculture. A crop of clover equal to two tons of hay, when plowed under will furnish more ammonia to the soil than twenty tons of straw-made manure, drawn out fresh and wet in the spring, or than twelve tons of our ordinary barn-yard manure. No wonder Mr. Geddes and other in-

telligent farmers recommend plowing under clover as manure. I differ from them in no respect except this: that it is not absolutely essential to plow clover under in the green state in order to get its fertilizing effect; but, if made into hay, and this hay is fed to animals, and all the manure carefully saved, and returned to the land, there need be comparatively little loss. The animals will seldom take out more than five per cent of all the nitrogen furnished in the food—and less still of mineral matter. I advocate growing all the clover you possibly can—so does Mr. Geddes. He says, plow it under for manure. So say I—unless you can make more from feeding out the clover hay, than will pay you for waiting a year, and for cutting and curing the clover and drawing back the manure. If you plow it under, you are sure of it. There is no loss. In feeding it out, you may lose more or less from leaching, and injurious fermentation. But, of course, you need not lose anything, except the little that is retained in the flesh, or wool, or milk of the animals. As things are, on many farms (including, it may be, my own) it is perhaps best to plow under the clover for manure at once. As things ought to be, it is a most wasteful practice. If you know how to feed out the hay to advantage, and take pains to save the manure (and to add to its value by feeding oil-cake with it) it is far better to mow your clover, once for hay, and once for seed, than to plow it under. Buy oil-cake with the money got from the seed, and growing clover seed will not injure the land.

Some good wheat growers in this county mow their clover the first year for hay and for seed, and the next year pasture it till the middle of August or the 1st of September, and then plow it up and sow wheat, without any previous cultivation, and little, if any, harrowing. They say they get better Mediterranean wheat in this way than if the land was plowed in June or July, and "summer-fallowed." The straw is stouter and the grain yields better. If your land is clear and in good heart, I do not see why this is not an excellent plan. Wheat requires a firm foothold, and I have often thought that we not infrequently get the surface soil, on light land, too loose and mellow. The time to clean and mellow the land for wheat is when it is in corn, two or three years previous. The Norfolk or Four Course System of Rotation, almost universal on the lighter soils of England is: 1st, Turnips; 2nd, Barley, seeded with clovers; 3rd, clover, hay or pasture; 4th, wheat. The labor is nearly all spent in preparing the land for the turnip crop. It is frequently plowed four times, and cultivated, harrowed and rolled repeatedly. Barley is sown as early as the land can be plowed, and got into good working order. The clovers are sown and harrowed in with a light harrow, and the roller is passed over the field when the barley is an inch or so high. Wheat is sown on the clover sod immediately after it is plowed. When sown broadcast, the land is not even harrowed, but the seed is sown on the furrows as left by the plow.

If our land was rich enough, and we treated corn as a "fallow crop," cultivating it until the soil was as mellow as an ash heap, we might adopt the same system. Sow the corn stubble with barley, and seed down heavily with clover. Pasture it but little, if any, in the fall, after the barley is harvested. Pasture it the next summer with sheep till the 1st of September. Plow and sow wheat at once. Seed down the wheat again with clover. Mow it for hay and feed

the next year. Then manure heavily and plant corn. The success of such a rotation will depend on the thoroughness with which the corn is cultivated. Generally our barley stubbles are overrun with weeds, and for this reason we do not more frequently seed down with barley.

The best thing to do with a seeded down barley stubble infested with weeds, is to run the mowing machine over it, and shave off the stubble, weeds, etc., close to the ground. I adopted this plan last fall on my wheat stubble, on some sandy knolls, that were full of thistles. It has checked them sufficiently to enable the clover to get the start of them this spring, and I think it will smother them out. The mowing machine is not appreciated as a means of destroying weeds as fully as it should be.

Imaginary Diseases, and Grub in the Head.

Could we have a report of all the diseases of which our domestic animals die, made out by their owners, the list would be a very instructive one. A few days since we were soberly assured by a farmer that he had lost two horses from feeding them corn stalks in the winter. We imagine it would be very hard to kill a horse with as many corn stalks as he could eat. Among the "archives" at the *Agriculturist* office we have many sure cures for horn-ail, and we have hardly a doubt but hundreds, if not thousands, of our readers might be induced to testify that their cattle had died of this disease. The temperature of the horns indicates in a measure the health of the animal. If the horns are hot, it is feverish; if cold, there is a lack of circulation—but of all parts of the body they are probably least liable to be affected by disease. We even doubt if they are ever primarily affected. Very much the same is true of sheep dying of grub in the head. There is no doubt about the distress caused by these parasites. The gadfly causes great distress when it deposits its eggs on the nose of the sheep after midsummer. The larva which soon hatches annoys the animal intensely when it ascends the nostril, and in spring the mature larvæ make the poor animals nearly wild and crazy when they leave their homes in the cavities of the head, and descending through the nostrils, come away—to burrow in the earth, and in about two months to reappear as perfect gadflies. A correspondent, using the signature "Hermon," having 15 years' experience, has sent us some sensible notions on this subject, which we give:

"The nearly universal theory of grub-generation is undoubtedly correct. And it is also true that nearly every sheep has grubs in the spring; as may be proved by dissecting the heads of slaughtered sheep. Yet, who ever knew of a flock of sheep being attacked by the disease called grub in the head while they were being fattened for the butcher? Towards spring, when they have lost much flesh, from scanty food or lack of shelter, and sometimes both, the sheep will die. Then the farmer takes his ax, and splits the skull, where, sure enough, he finds the grub. This removes all doubt about the disease, and excuses him from all neglect, for 'the grub is incurable.' Now, if this same man should have sheep killed by dogs, and the heads should be found to contain grubs also, would he say the disease, or the dogs, were at fault? Sheep in reasonable condition in the fall, and kept thriving through the winter, are rarely, if ever, said to die of the grub. The more severely a sheep is afflicted by them, the more liable it is to become even worse the next winter. Hence

the wisdom of the advice of an excellent breeder, not to winter a sheep again, that has once fallen off badly. The appearance of a chronic catarrh is often the result of grubs, producing a constant inflammation of the membrane lining the cavities of the head. If sheep are seen to droop or show other symptoms of failing vigor, they should be put on the 'pension list' at once, and receive, in company with others of their class, the most palatable and nourishing food at command. This treatment, if seasonably attended to, will cure the 'grub,' if the sheep is not one that has become obnoxious to the disease, by former attacks, through which the animals' constitution was weakened by its efforts to expel the enemy. A sheep once on the 'pension list' should never be wintered again."

Home-made Tools.

A farmer ought to be a tolerable mechanic, and make, as well as mend, a great many things. Rainy day work is often advantageously that of the jack-plane and drawing-knife.

Harrows are frequently home-made—and we have seen some very good ones cheaply made and outlasting two or three of those made at the factory. The temptation on the farm is to make tools too heavy. In purchasing, the temptation is to spend little, and so not secure a first-rate article. The harrows made of a natural crotch are rarely seen nowadays, but still in their day were not to be despised. Good crotch-harrows for an "A" harrow are hard to find. Mr. R. T. Smith, of Ulster Co., N. Y., sends us a drawing of a harrow without the cross beam. The construction is obvious from the figure. The bolts are both necessary, not only to prevent the head opening, but to stop any tendency to twist. They are five-eighths iron

Fig. 1.—HARROW WITHOUT THE CROSS BEAM.

bolts with nuts. The shorter and front one passes through the strap-staple, on which is the draft ring. The teeth may be of iron or of wood; if the latter, 1½ inch oak pins are best. Holes should be bored diagonally in the ends of the harrow, to receive the ends of a bent pole reaching conveniently high for the plowman to lift the harrow by without stooping. Harrows are much used nowadays for giving potatoes and corn the first or two hoeings. The cross piece in an "A" harrow is in the way in

Fig. 2.—WHIFFLETREE.

hoeing corn, the front part of the implement running usually high enough to clear the plants. In the one figured this difficulty is obviated. In hoeing corn the front tooth is always removed.

Whiffletrees.—It is usually quite as well to buy whiffletrees as to make them; but very good ones may be very easily made altogether of

wood, except the clevis. The one shown in fig. 2 is of 1½-inch ash, with a ¾-inch hole near each end to take a rope trace. A form more convenient, because adapted either to leather or

Fig. 3.—WHIFFLETREE.

chain traces, is shown in fig. 3, the trace hooks being attached to iron bands. Fig. 4 represents a very strong whiffletree. Eyes in which to fasten trace hooks are made in the ends of an iron rod of suitable length and strength, an eye or loop is made in the centre, and the rod riveted, as shown. The ends of the rod are either bent a little and braced apart by a stout piece of oak wood, being let into grooves in the wood and held by staples, or made with eyes to receive the ends of the wooden brace. In the former case, shown in the cut, the brace should have a bolt through each end, to prevent splitting. In this form lightness is consistent with great

Fig. 4.—WHIFFLETREE.

strength. The size of both iron and brace must be proportioned to the draft likely to be applied.

Facts in Shad Hatching.

The experiment of Seth Green, in hatching shad at Huxley Falls, last season, brought out several very interesting facts in regard to the ova of this fish. First: The eggs need river water to hatch in. He first tried his experiment in a brook, where the water was 13° too cold, and failed. Second: In the river, where the temperature was about 70°, the eggs hatched in 60 hours. Eggs have been hatched in a bottle, in a warmer temperature, in 48 hours. Third: By tilting his boxes, so as to expose only the wire gauze bottom to the current, he hatched almost every egg; only seven failing to hatch in one lot of 10,000. Fourth: With the utmost care, he could hatch on the natural river-bed only two per cent of the eggs—a fact most significant of the enormous loss in the natural method. Fifth: The young fry make directly for the main current of the river. Young trout, much more hardy than shad in after life, skulk under rocks and banks, helpless and almost too weak to move for forty days. Sixth: Young shad are armed with teeth and devour one another, although the adults have smooth jaws. This fact has been relied upon to prove that "sea shad," a fish caught with the hook along the mouths of creeks and coves of L. I. Sound, in the fall, are a distinct variety. They weigh from one to three pounds, and, to the careless observer, look like the river fish. Are they the yearling shad? Who can tell us? The brief period of incubation required for the eggs of this fish would indicate its rapid development and early decay. It is disputed at what age the shad matures its spawn, and returns to the rivers to breed. If the "sea shad," that take the hook, are identical with the river species, they are probably the fish in their second year, about half grown. At two years old, they reach maturity, and begin to breed. With the interest that is awakened by these experiments, it cannot be long before these questions are settled.

These facts, established in the operations of last year, demonstrate the entire success and economy of the efforts made in New England to restock their rivers with fish. Fish of any variety can be artificially bred in any desirable quantity, and turned into the streams where they are to grow. Man has in a measure control of these migratory fish, and with suitable legislation can make their enormous fecundity tributary to his support. The economy of the artificial over the natural method is much greater than we had supposed. It is nearly as fifty to one. Every river can be stocked with fish, at small cost, to the extreme limit of its capacity to nourish them. It will not cost so much to hatch a million of salmon in the upper waters of the Connecticut as it does to raise a single calf upon its banks. The finest varieties of fish ought to be the cheapest food in the market, and cannot fail to be, if all our States will follow the example of the New England States, and encourage artificial breeding.

Thatching with Straw.

Thatch makes a very serviceable and economical roof when well put on. It is highly picturesque, easily repaired, and usually requires no outlay of money, which with many farmers is a great advantage. The mode of making a thatch roof followed in the vicinity of New York is very simple. 1 inch × 1½ inch strips of wood (a, a, a, figs. 1 and 2) are nailed upon the rafters about 12 to 14 inches apart, one strip being at the very end of the rafters at the eaves. Rye straw is ordinarily used, because it is long and stiff. It is sprinkled and turned, to become uniformly moist; long, straight armfuls are selected by handfuls, and the first course is laid, beginning at the eaves. The butts rest upon the lowermost strip, and project over it. A set of light poles (b, b, b, figs. 1 and 2) are provided, one of which is placed upon the course of straw, and when enough has been laid, the pole is bound down to the strip beneath it at short intervals, according to the stiffness of the pole. This binding is usually done with split oak withes about 30 inches long, three-eighths of an inch wide, and a scant eighth of an inch thick, well soaked before using. These withes have one end sharpened, and an assistant passes each one up through the thatch from below; the thatcher turns it, and putting it over the pole,

Fig. 1.—THATCHING.

passes it back again, when it is drawn tight, aided by pressure from above, twisted and one end tucked. The top layers are lapped, and the upper poles exposed to the weather; these should be bound with "galvanized" iron or copper wire. It has been customary of late years to depart from the old-fashioned practice of using oak strips for binding thatch, and to employ tarred rope yarn, which is drawn back and forth through the straw with a wooden needle, but time proves this to be unreliable, as it rots long before the withes do. We are inclined to think that wire

would be far better than either, though a little more expensive. There is a thatch roof on the farm adjoining that of the writer, which has

Fig. 2.—SECTION OF THATCH-ROOF.

been laid more than 20 years, and having had a little patching recently, is good now. The engravings represent the layers of straw very distinct, for the sake of illustrating the manner of putting them on. When finished, the thatch presents nearly an uniform surface, the eaves are clipped evenly, and the whole roof raked down. There is a great necessity for making the thatch of even thickness. The irregularities of one layer are counterbalanced in a measure by those above and below it, but care should be taken to have one about as thick as another; and it is desirable, in order to accomplish this, that the straw should be nearly of an uniform length.

Native Cattle.

We talk about native cattle; if by this we understand mongrels, nondescripts, or mixtures of the run-out blood of various breeds, then the name is misused. We should say "common cattle." If we use the name rightly, it would indicate that climate, feed, and treatment, had influenced the common stock of cattle, so that those of a particular district had become in many points very similar. This is not the case, so far as we know, anywhere in this country, except to a very limited extent, though we almost wonder at it. There was a time, a few years since, when it seemed as if we might expect to see such native breeds developed in various parts of our country; but the general dissemination of the improved British breeds has, we think, broken up any foundations of new breeds which might have been laid. The red cattle of Connecticut now have almost all a dash of North Devon blood, introduced within forty years; but previous to that the cattle having come from the south of England, where the prevalent color of the native breeds is red, and having been bred with some intelligence, had preserved their color and improved in form, so that, though differing essentially from any pure English breed, they yet agreed quite as well among themselves as some recognized breeds.

Throughout the older Northern States cattle have been bred for years for milk and veal more than for beef, and yet our common cows have never been reliable as milkers. It has even become proverbial that a good cow's heifer calves were rarely equal to their dam, although bulls coming of famous milkers were more frequently getters of good milch stock. Famous milkers are always to be found among the so-called "Natives," and if one wished to establish a fine dairy herd, his best plan has been, and still is, to select through the country these deep milkers wherever he can find them—and yet the maintenance of the herd from males of his own breeding has been always attended with disappointment, and its deterioration in good points.

The same result has been obtained in regard to breeding for beef, for it was not until the introduction of the improved British breeds, Devons, Short-horns, and Herefords, that uniform excellence of quality, rapid growth, and economy of feeding, could be predicated with anything like the certainty with which we now raise grade cattle for beef, notwithstanding the immediate progeny of certain animals occasionally resembled their sires or dams in early maturity, easy fattening, and excellence of the beef.

We present these facts in order to enforce the important fact that *no breeder can expect to improve his stock except by breeding exclusively from thorough-bred or full-blood males*. This is a broad, general principle, and equally applicable to all *polygonum* animals, that is, those which do not *pair*, from horses to barn-yard fowls.

A Summer Fowl-House and Yard.

A very large number of those who might be enthusiastic poultry keepers are deterred from keeping fowls, because the narrow accommodations in which fowls do very well in winter are too small for them in summer, and they cannot be allowed free range, or they would damage their owner's and the neighbors' gardens. To meet the wants of such, as well as of those fanciers who wish to keep several breeds separate, Mr. J. H. Mabbett, of Jersey City, has devised the following neat plan, which we think combines taste, cheapness, and efficiency. He writes: "I would suggest to those who may adopt the plan, that they buy young fowls of some of the many good breeds, and feed them well, giving them all the refuse pieces of bread, pastry, meat, etc., of the table, which will be eagerly eaten, and materially reduce the amount

manner: There are eight 2×3-inch rafters, 7 or 8 feet long, "tied" by cross strips connecting those opposite, the strips being nailed to the rafters above the middle. The roof extends four feet from the peak on all sides. The eight posts for the house are nailed to the rafters so that the eaves will extend a few inches beyond the sides, which may be of three-quarter inch pine boards, one of the sides being a door. The floor is an open work of laths, and is two or three feet above the ground. An alighting shelf runs around the whole house, and nest boxes are set inside, accessible by sliding doors from without, for removing the eggs. The ends of the rafters are connected by 2×3-inch plate pieces, nailed to the rafters and to the eight posts. These posts may be about 6 feet high, and are nailed upon sills, all of the same sized stuff. This external frame is covered or filled in with a lattice-work or plain slat-work of common building laths, substantially in the manner shown in the engraving. This whole structure, if made of the largest size contemplated, would be entirely portable, and might by slipping a couple of scantlings under the sills be pushed about upon rollers almost anywhere, upon nearly level ground, and so be shifted every few days to where the grass is fresh. A ventilator is provided in the top of the house, and a step ladder, if necessary, for the fowls to ascend two or three feet to the alighting shelf.

Clover West of the Mississippi.

Grass and grain grow so freely at the West that until recently the farmers have paid little attention to crops that would improve the soil, to rotation, or to other means of increasing its productiveness, using little draining, little manuring, and very little clover. The following letter from J. L. Erwin, of Callaway Co., Mo., will be read with interest, as it evinces progress in the right direction, and indicates profitable fields of labor for industrious men:

"Doubtless many of your readers, like myself, own small farms and would like to make them as valuable as they can. Nearly, if not all the model farms we read of are so large, and the capital necessary to run them successfully so great, that we despair of ever being able to make ours models. There is very little systematic farming done here—no rotation of crops, and but little clover grown. I came to this State in April 1866, brought with me a bushel and a half of the common Red

SUMMER FOWL-HOUSE AND YARD.

of grain required to keep them. If six or eight good hens are selected and well cared for, they will supply an ordinary family with all the eggs required for the season, and in the fall when they stop laying, will be in fine condition for the table." The plan presented contemplates the suspension of a small octagonal house, about four or five feet in diameter, in the following

clover seed, and about half a bushel of what we have always called the 'Large Red' or 'English' clover seed. We sowed one bushel of the former and three gallons of the latter, each with an equal quantity of Timothy seed, on oats, immediately after sowing. It all came up well, but in July and August the Timothy and a great deal of the common clover perished with

the drouth, and was not worth mowing last harvest. The large kind was injured somewhat also, but we cut four acres of it for seed last fall, and had sixteen bushels of good seed, worth \$10 per bushel. It stands the dry season apparently much better than the common clover. Clover and Timothy do better here, if the ground is thoroughly rolled immediately after sowing. Our subsoil is a stiff clay, holding water like a jug. I have been studying Draining for Profit, and am satisfied it would greatly benefit my farm to have it well drained, but the cost of tile is so great I cannot now make the trial. I do not know of a single tile factory west of the Mississippi. Limestone is plentiful; wood is worth \$2.50 to \$4 per cord delivered; coal is worth \$3 to \$4 per ton, yet lime is worth 35 cents per bushel at the kiln. Here is a good chance for a few lime burners. Many of our farmers would use it could they get it at a reasonable rate."

Cabbages as a Field Crop.

Farmers who keep cows for milk, and have tried cabbages, are pleased with the results. They furnish at a small cost a very large amount of fodder, at a time when the pastures fail. They are highly relished by cows, secure a large flow of milk, and if fed but once a day, immediately after the morning milking, they impart no unpleasant taste to the milk. Either old ground or a fresh sod may be taken, and it should be manured very liberally. We have succeeded well by planting cabbages as a succession crop between rows of early potatoes, setting the plants the last of June or first of July, and digging the potatoes from the 4th to the 20th of the latter month. In this case, superphosphate of lime, bone-dust, or some concentrated fertilizer should be applied as soon as the plants are fairly established. If no other crop is attempted, plow with a double Michigan plow, and manure thoroughly early in the season. Keep the weeds down with the harrow until June, and at any time, from June 1st to July 15th, set out the plants, three feet apart, and two feet in the row. Six or seven thousand plants can be raised to the acre. The transplanting and cultivating can all be done by boys, costing not more than one-half as much as the labor of men. If the cultivator be started soon enough after the transplanting, the hoe need not be used at all. A good deal depends upon getting the right varieties of cabbage and seed of the best quality. The Bergen Drumhead, Premium Flat Dutch, and Stone Mason are among the best varieties for field crops. Sow the seeds in well-worked, rich seed-beds three or four weeks before the plants are wanted.

Root Crops for Feeding.

We believe there is a steady increase in the cultivation of turnips, parsnips, beets, and carrots, for feeding cattle. Intelligent men who have tried the experiment fairly are not content to go back again to feeding with hay and grain exclusively. There is a great craving among cattle for something succulent and juicy in the winter, that is best met by these roots. The animals thrive better, and other food goes further, for this change in the diet. We have no doubt that the cultivation of roots as field crops would extend much more rapidly if farmers knew how easily they could be raised. With suitable implements nearly all the cultivation can

be done by horse power. The only occasion for the hand hoe is in the first weeding and in thinning out the plants to make a good stand. Old ground is better than a fresh-turned sod, as the soil needs to be finely pulverized. We have always had the best results from deep plowing and subsoiling. Fine compost or concentrated fertilizers should be used, one half plowed in and the other half sown broadcast and harrowed in. It is a help to soak beet, carrot, and parsnip seed for a day or two before sowing. Then mix them with superphosphate of lime, and sow with a drill. The young plants make their appearance before the weeds, and the rows are so strongly marked that they can be hoed out with very little labor. The cultivator should be started between the rows as soon as the plants are visible. Very much labor is saved, and larger crops are realized by timely and frequent cultivation. Stir the ground between the rows every ten days until the plants get possession. Parsnips should be put in early in the spring. Carrots sown June 8th make a good crop in the latitude of New York, and Rutabagas and White French turnips may be delayed until July 1st. It is easy to raise from 600 to 1000 bushels of roots to the acre at an expense of not more than 15 cents a bushel. Try an acre of roots.

Truss Beams over Wide Barn Floors.

In the February number, p. 52, we exhibited a plan for a truss beam for securing a wide barn floor. Mr. Wm. Ashley, of Bloomfield, N. J., sends us drawings of trussed beams stiffened by iron rods in a way to give them great strength. His directions are: "Take two sticks of timber of the length you want; on one of them nail

Fig. 1.—TRUSS BEAM, 20 FEET LONG.

strips three inches wide, and of the thickness of the rod to be used, as shown in fig. 1, and cut places in the strips for the rod to lie in. Get a rod of iron of suitable length and size, as explained below, and have a thread and nut on

Fig. 2.—TRUSS BEAM, 20 FEET LONG, IN SECTION.

each end; put it between the timbers, and bolt them together as shown in fig. 2, the bolts passing through the strips. Then cut off the corners of the timbers at right angles to the rod, and put on strong iron plates with holes in their

Fig. 3.—TRUSS BEAM, 30 FEET LONG.

centers for the rod to pass through. Take a piece of iron of the same size as the rod and as long as the thickness of the entire beam; place it under the center between the rod and the timbers, and screw up the nuts on the ends. Thus we have a perfect truss beam, which no

Fig. 4.—TRUSS BEAM, 40 FEET LONG.

ordinary weight will break, with all clear room above and below. Trussed beams over 20 feet long should have two bearings for the rod. The following dimensions may be stated. For a 14-foot span, use 1½-inch plank, 8 inches wide, with ¾-inch iron rod. For a 20-foot span, use 1½-inch plank, 10 inches wide, with ¾-inch iron rod, shown in figs. 1 and 2. For a 30-foot span, use 3-inch plank, 10 inches wide, with ¾-inch

iron rod, shown in fig. 3. For a 40-foot span, use 3-inch plank, 13 inches wide, with 1-inch iron rod, shown in fig. 4. The bolts which the rods draw over must be of equal thickness to the rods.

Field Beans.

There is said to be more nourishment in beans for the money usually paid for them, than in any other article in the market. For the laboring man they are always wholesome and palatable, good green and dry, good in soups and succotash, and indispensable baked in every Yankee family. The crop is popular in all parts of the country, but holds a secondary place, and, like buckwheat, is put off upon poor, neglected land, where no other crop will pay. We think it deserves good land and better treatment. There are three varieties of the field beans grown for our northern markets—Pea bean, Blue Pod, and White Marrow. The Blue Pod is also called Medium, from its size, and is the common "white bean" of New England and New York. The Pea bean is about half the size of the common white, and does not sell so well. The Marrow is about twice the size, is of much better quality, and sells higher. It requires the same treatment, and should always be planted, if the seed can be had. In a very wet season, or on very rich soil, the vine is more inclined to run, and the crop is not quite so sure. The White Kidney is a much better bean than the Marrow, and though commonly raised in the garden, is well adapted to field culture. It will not bear neglect so well, but with good treatment we have no doubt it would yield more bountifully, and pay better. It requires a little longer season, and is a good bearer. The

bean is long and about twice the size of the Marrow, and always sells higher. The soil best

adapted to the bean is a good sandy or gravelly loam, in good heart. The application of fermenting manures is objectionable, as it makes the plant run too much to vines. For this reason it is better to plant beans upon old ground, well manured the previous year, than upon fresh sod. They follow corn or root crops very well. The old

mode of cultivation in New England used to be as a "stolen crop," between corn, planted at the second hoeing, or about the last half of June. The corn was planted in rows both ways, and at the second hoeing, the beans were

planted in rows, one way, a hill of beans to each hill of corn. The beans were hoed with the corn at the

third and last hoeing, and the cost of cultivation was very small. This practice also had the advantage of convenient drying, as the beans were pulled soon after the stalks were cut in September, and placed in bunches upon the hills of corn to cure. Of course the beans

were much shaded, the yield was small, and they made the corn crop smaller

that it would otherwise have been. A better practice is to give the beans a field by themselves, and let them have the full benefit of the soil and sunlight. After plowing as early in the season as the ground will allow, harrow thoroughly, every two weeks, to destroy weeds, until the first of June, when the seed may be put in. The crop will mature if planted any time before the first of July. We prefer planting in

drills two feet apart. Much labor will be saved by having a machine that makes a furrow, plants, and covers, at one operation. If they are planted in drills, the hills of the smaller varieties may be put eighteen inches apart in the rows, and the larger kinds, two feet apart. In smooth ground, all the cultivation may be done by horse power, and this should be attended to as often as once in ten days, until the pods are well grown, when the cultivation may cease. When the plants turn yellow, and before the pods open, pull the vines and put them between stakes to dry. Two stakes driven into the ground about six or eight inches apart will answer a good purpose. The excellence of the crop depends a good deal upon the perfectness of this curing process. If left upon the ground, they often mould, and become spotted. They should be left in the field until they will shell easily. They are then removed to the barn floor in a cloudy or damp day, to prevent shelling, and thrashed out, when it is convenient. Some thrash them in the field, but the barn floor is cleaner, and always gives shelter in case of rain. If thoroughly dry, the beans after winnowing may be put immediately into barrels or bins.

Renovating Old Meadows.

John Kelsey, of Yardleyville, Pa., who has an original and good way of doing many things, reports to the *Agriculturist* his method of renewing old mowing lots without plowing. "If the surface of the meadow is sufficiently smooth, that is, needing no moving of the surface, the most effectual way is to harrow it until the sod is entirely loose, using a Kelsey harrow (that is, one with a pole or shafts). This should be done immediately after mowing, as the hot sun will then kill all the grass roots. Let it be harrowed about once every ten days until about the 25th of August, then spread on 50 bushels of lime to the acre, and harrow it well. Sow the timothy seed about 4 quarts per acre, about the first of September, roll it down, and put up the bars or shut the gate, and if you do not get a crop of grass the following harvest then set me down for a humbug. Perhaps some may say that 'the grass roots will clog up to the harrow;' if so, rake them into windrows and set fire to them, and then scatter the ashes over the lawn. I dressed up an old meadow of ten acres in Bucks Co., Pa., and succeeded in raising 25 large two-horse loads of clean timothy hay the first crop, where in former years only two loads of trash had been raised, and that by a man whom tradition says was 'the best farmer in Bucks County.'"

Packing and Keeping Eggs.

In the months when eggs are abundant it is often desirable to pack away fresh eggs for use in a time of scarcity; and in the spring and early summer, when eggs are to be kept for hatching or packed for transportation for the same purpose, it is peculiarly important that they be well packed. To this end some knowledge of the structure of the egg is useful. Within the shell we find first two distinct lining membranes, which are separated at the large end by a small cell, or bubble of air. This is an arrangement whereby the egg is always full; for though the fluids of the egg contain water, and this evaporates through the shell, the air bubble enlarges just in proportion, and so there is never a cavity within the inner membrane. The white of the egg lies in contact with this lining tissue.

It is not simply the thick, glary substance which it appears at first sight, but it exists in spherical layers of different densities, and separated by exceedingly delicate tissues. This may be seen when an egg is broken and the white turned off, and when after long boiling the white is divided or broken so as to show the layers. Enclosed in the white, or albumen, is the yolk, which consists of albumen mingled intimately with oil, and this is in concentric layers. Upon one side of the yolk are two heavy whitish masses, which consist also of semi-membranous albumen, called chalazae, and opposite to them is the minute germ which is the center of vitality. The chalazae, being heavy, keep the germ always uppermost, and in position to receive most directly the warmth from the body of the hen. The yolk is the food provided for the chicken for a few days after it is hatched, the white being the material out of which the body of the chicken is formed. The white will dry away on exposure of the egg to the air, and no decay will take place if the air contain but little moisture, that is, if the drying be rapid enough. We have had eggs, which, after having been kept in a very dry place a few weeks, had apparently lost nearly half their weight, yet were not "stale," and transmitted the light of a lamp with almost the ruddy glow of fresh eggs. If, however, the air is moist and warm, the egg soon begins to decay. When eggs are kept for hatching, the loss of water, except to a very limited extent, would probably be fatal to the germ; hence they should be put in a cool place, and covered. It is well, also, to change the position of each egg occasionally. For transportation it is well to pack them points down, in bran, in a paper box, and to pack this in a wooden box surrounded on all sides with hay. The danger of jars rupturing the delicate membranes is thus greatly diminished. One may easily prevent an egg from hatching, by holding it in the hand and striking the fist smartly upon the knee. When eggs are to be kept for eating, if smeared completely with tallow, the air will be shut out, and they will keep a long time. A coating of resin dissolved in alcohol would be equally effective, and beeswax and sweet oil are used by the French for the same purpose. Hard-boiled eggs, say boiled twenty minutes, will keep good for months, and may be used for salads. Packed in jars filled with lime-water, eggs will remain sweet a long time, and several correspondents unite in advocating the use of salt with lime. Two ladies recommend the following: "One pint of salt, one pint of slaked lime, to one pint of water." The eggs are placed in the vessel containing this and kept covered with the water. The vessel should also be kept closely covered. "Mrs. M. J. B.," says she found them good at the end of a year. There are several patent processes for preserving eggs, the proprietors of which have sent us circulars with certificates of their practicability attached. As we know nothing of any of these processes beyond what is claimed by the patentees, we are not yet in a position to advise our readers to invest in these patents.

One More Acre of Potatoes.

Last year the crop was short in all parts of the country; in the West from excessive drought, and in the East from excessive rains. Potatoes have not been so high in twenty years, and the great prices have increased the expenses of living, among the laboring classes, for everybody feels that he cannot get along without this vege-

table in his family. Five dollars a barrel and upward has been the price, for a good article, in the New York market for the last four months, and they have been retailing at the grocers for sixty cents a peck. Farmers, who had potatoes to sell, have been in luck the past winter. This crop, at fifty cents a bushel, pays better than almost any farm crop. With very careless culture it is not difficult to get a hundred bushels to the acre, and with good cultivation twice that amount is often realized. If it be said, that the crop has extra risks, we admit it; but a man can afford to run some risk for the chances of the extra profit. But the risk is very much diminished by avoiding the causes that predispose the crop to rot. The new seedlings, as the Goodrich, Harrison, Cuzco and Sebec, with fair treatment, have very little rot. Abandon the old varieties, and plant these exclusively. Fresh fermenting manures induce rot. Therefore plant on sod, or on land well manured last year, and manure in the hill with plaster, or with ashes. Avoid heavy wet land and plant on light sandy or gravelly loams, or on land well underdrained. Plant in drills, thirty inches apart, and one foot apart in the drill, and do all the cultivation possible with horse power. Let us have, this year, potatoes enough for all.

The Willows and their Uses.

The most common use of the Osier Willow, (*Salix viminalis*) is the making of baskets. Though we have every facility, in soil and climate, for growing it in the greatest abundance, it is still imported in considerable quantities, both in the rough and in the manufactured state. Some progress has been made in this country in its cultivation, and machines have been invented for peeling the bark, which was a laborious process as done by hand, and was a serious obstacle to the cultivation of basket willow here, where labor is so high. But this plant and other varieties near akin are used for other purposes, and their cultivation ought to be greatly extended. In the making of rough fences, every farmer has occasion to use withes, and several common varieties of the willow would be found more supple and quite as durable as the birches, oaks, and hickories, commonly used. One of the best varieties for this purpose is the Variegated Willow (*Salix decipiens*). The Goat Willow (*S. caprea*) also makes good, stout withes. In the nursery, flower garden, and propagating grounds, also, the willows are very handy for a variety of purposes. They make good stakes for all the smaller plants and vines, that need tying up; they make trellis rods, also, of an extemporaneous character, and furnish the withes for fastenings. For tying the arms of vines or espalier trees, the Yellow Willow (*S. vitellina*) furnishes very neat little twigs. They are more convenient than strings, and may be always at hand. In the vineyard, the willows make the cheapest stakes for the earlier stages of the growth of the vine. A few square rods of ground cannot be put to a better use than growing willows for these purposes. There is scarcely any land that will not raise willows, but to raise the best rods for the basket-maker, as well as for other purposes requiring long and straight shoots, a fertile soil is required. One that is well drained and rich without being wet is better than a constantly moist soil. Of course, we now speak of where their culture is to be made an object of profit; where the Willow is to be planted only as a thing handy to have for withes,

(COPYRIGHT SECURED.)
 "THE LAST SHOT."—FROM A PICTURE BY R. ANSDALL.—Drawn and Engraved for the American Agriculturist.

etc., the plants may be put in any convenient place, such as the bank of a brook or other unavailable land, and be left without other care than to cut them over, every year or two, or when the shoots get too large to be useful. This however, can hardly be called culture. In cultivation the land is well mellowed and the rows laid out at a convenient distance for working, for to get good rods there must be good culture. In England, where the work is done with a hoe, the rows are eighteen inches apart, but with us, where horse cultivation is almost universal, thirty inches would be better. The Willow grows perhaps more easily than any other plant from cuttings, and only the greatest neglect can cause a failure. Cuttings are made of last year's growth, a foot long, using only the strong wood and discarding the weak tips which would make weak plants. The cuttings are dibbled in at a foot apart in the rows, leaving a third of their length above ground; the soil is pressed firmly against the cutting with the foot, and the work of planting is done. The crop should be cultivated with as much care as one of corn, and there should be no cutting made the first year after planting. The second autumn the shoots are cut down to within a few buds of the base, and the third autumn should give a full crop.

"The Last Shot."

Our pacific pages are seldom startled by such a scene of blood and carnage as the one here presented, and we introduce it here not to draw any lesson of a practical character, but as a reminder of the hardships and dangers of frontier life—and the perils of the trappers among our northern and western wilds. The engraving is from a painting by an English artist, R. Ansdall, and represents the wolf of Europe—which, however, is so similar to our own that naturalists have until recently, generally regarded them as identical. Their habits are the same, they being the most treacherous, cowardly, sneaking thieves imaginable. The presence of wolves in frontier regions is seldom dangerous to the inhabitants, except to young children, and even these are rarely attacked if calves, sheep, or pigs are to be found. When emboldened by numbers, or pressed by hunger, and attacking in packs, they are formidable foes. Following the trains of travelers or hunting parties to feed upon the refuse of the camp, they often attack isolated animals, as disabled horses, or cattle, or even the solitary traveler. Scenes like the above occur only in the depths of the forest, or on the unfrequented

trails among the mountains. The dropping of a blanket saddle cloth, or something they will eat, occasionally shooting one of the pack, and similar expedients, are resorted to to direct their attention from pursuit, and a lasso trailed upon the ground is one of the best means of frightening them away. These attacks are directed against man only when the animals are driven by hunger to absolute desperation, but are then made with astonishing perseverance and the most savage ferocity. The bite of the wolf is a quick succession of gnashes, so that when once they pull an animal down, or have a fair chance at one, they soon disable him. We believe nothing of flesh and blood can withstand these bites—for when wolves are really hungry they will make short work of even dry rawhide ropes, and leathern wagon traces. The pack of wolves runs down the traveler's horse, and then frightened and exhausted he falls an easy prey, unless his rider makes a good fight. In the above picture the artist's grouping is effective, his management of light and shade is excellent, and the whole scene spirited, as if it were the portrayal of one in which the artist had been at sometime an actor. It will soon give place to a scene of "still life," if the "last shot" is as effective as the others.

A GROUP OF BELL-FLOWERS.—Drawn and Engraved for the American Agriculturist.

The Bell-flowers—Campanulas.

Among the herbaceous perennials the Bell-flowers are high in our esteem. They are hardy, easily propagated, and remain long in bloom; they give us considerable variety in habit of plant and form of flower, and every shade of blue, besides white, and other varieties. They are all beautiful, from the tiny native Harebell, to the Pyramidal Bell-flower, which grows to the height of four or five feet. Almost every one knows the old Canterbury Bells, (*Campanula medium*), a biennial formerly seen in our gardens more frequently than at present. This is the best known, and has the true bell-shaped flower which suggested the generic name—Campanula. Our artists have enlarged and reproduced from small sketches by Riocreux, the great French draughtsman of flowers, excellent representations of some of the less-known species. The one on the extreme left is the Large Bell-flower, *Campanula grandiflora*. It is so unlike other Bell-flowers that some botanists have separated it from them, and it has been called *Platycodon* and *Wahlenbergia*. The large, shallow flowers are borne on stems one foot or more high, and in the bud present a curious balloon shape. The color varies from the deepest blue to white. It not rarely happens, as in other species, that a second corolla appears within the other, making the flowers semi-double.

The next and smallest of the four is one of

our prime favorites—the Carpathian Bell-flower, (*C. Carpathica*). It is delicate in habit, and a profuse bloomer, beginning to produce its small flowers in June and keeping it up until stopped by hard frosts. Next this is the Bouquet Bell-flower (*C. glomerata*), so called from the manner in which it bears its flowers in clusters; it grows about two feet high, is rather stiff in its habit, but very ornamental in the grounds.

On the extreme right is the Tall Bell-flower, (*C. grandis*), a noble plant growing three feet high, and covered with large, bell-shaped flowers of a clear blue color. This is perhaps less common in gardens than either of the others.

The Peach-leaved Bell-flower (*C. persicifolia*) is not figured; it is, however, one of the most beautiful in a beautiful genus. Very many more might be mentioned, but we only wished to call attention to Bell-flowers in general, and refer to the seed catalogues for the list of all that may be cultivated. The perennial ones are easily multiplied by root-division in fall or spring, and they may be raised from seed by those who will wait a year for their bloom. In every garden of any extent it is well to have seed-beds especially for perennial plants, where the young seedlings can be grown in rows like cabbage or lettuce plants, when they will have care, and yet not interfere with the general effect of the garden. Thinning, weeding, watering, and covering in winter, can be better done when the plants are in such beds than when scattered about borders.

Currants and Their Enemies.

For some years we have endeavored to make the currant more popular, as we consider it a most healthful as well as easily raised fruit. That there are obstacles to its culture we are aware, and so there are to that of all fruits, and whoever is not willing to take proper care of his currants does not deserve to have them.

The most common insects injurious to the currant are the Borer and the Currant-worm. Both the American and the European Currant Borer trouble our plants, the one the larva of a beetle, and the other that of a moth, but as they are practically the same in their habits and effects, it is not necessary to speak of them separately. The larva lives upon the pith of the currant stem, and the insects come out from the dead stalks in their perfect state late in May or early in June. They lay their eggs upon the new shoots, and the young brood, when hatched, penetrate the stem and carry on their work of destruction. Where the bush is kept properly pruned no very extensive damage usually results from the Borers, as the infested limbs are discovered and removed at pruning; these should be burned, for if thrown upon the brush-heap the perfect insects will make their way out and provide for a continuance of the trouble.

The Currant-worm, which is the larva of an insect somewhat resembling the common fly, is the most destructive enemy of the currant.

The worms or slugs are small, keep upon the under side of the leaf, and the bush is often stripped of foliage before their presence is suspected. The worms, when they attain their growth, enter the ground, undergo their changes, and the flies appear to lay eggs for a new crop.

Powdered White Hellebore dusted over the bushes destroys the worms at once. A light dusting from a dredging-box is all that is needed.

A correspondent in the Country Gentleman suggests covering the ground around the bushes with coal ashes to the depth of five or six inches. The idea is that the coal ashes present a barrier to the exit of the fly from the ground in the spring. Concerning this, "Walks and Talks" writes: "Try the coal ashes, but at the same time watch the bushes, and as soon as you see the little, beadlike eggs on the under side of the lower leaves, crush them with the thumb and finger. The flies come out of the ground and deposit their eggs on the first leaves they come to. On neglected bushes there are generally a dozen or more suckers round the bush. The eggs will be found on these. Cut them all off, except one or two which may be needed to form new wood. In this way you will destroy hundreds of worms and benefit the bushes at the same time. Remove all the useless wood from the bush, and place it in the sun or burn it. You will have more and much finer fruit. This work should be done early in the spring."

The correspondent who complains that his fruit prematurely ripens and is worthless, will, if he carefully examines the berries, probably find within each a minute maggot. The only remedy we can suggest is to gather and destroy all such fruit before the insects have time to mature and prepare for a brood the next year.

Farm and Family Gardens.

The Native American race is one of meat-eaters, and our carnivorous propensities are quickly adopted by citizens whom we adopt. There is no reason why they should accept our vices with their naturalization, and there is every reason why we should engraft their virtues upon the Native American stock. Germans, French, Italians, and Swedes, are all famous for having good vegetable gardens. The majority of our best gardeners are English and Scotch, and sons of Erin set up for gardeners even before they have had time to shuffle off their Old Country brogans. If the good-wife knows how to use vegetables, she will accomplish a great saving of meats, both fresh and salt, and the meals will be much better relished, and more healthful. If she does not know, there is the more necessity for providing an abundance of all sorts of delicious vegetables to put her up to doing her part well. At all events, then, plant a garden—give it the best manure, well rotted, and plenty of it. Put it on three inches thick, and spade, fork, or plow it in. It will not make a big hole in the manure pile unless one sets out to raise vegetables enough for all the neighborhood, which might pay very well. It is not too late to begin gardening early in May, though April is the proper time to lay out, manure, and plow, to say the least. Those who begin now may with a very little more labor and the use of liquid manure have their tables supplied quite as early as many whose gardens were planted a month earlier. Carry good farm practice into the garden, and use good garden practice upon the farm. As a rule, short rows are a nuisance. A twelve or sixteen-foot board is frequently used in sowing the seed, and its length may sometimes determine the width of the beds

and length of the rows. The use of the board is twofold—as a guide to the rake stale in marking the drill in which the seed is to be sown, and as a walk while sowing and covering by hand. Of course, it is not used when a seed-drill is employed. The secret of good gardening is thorough tillage combined with clean culture and high manuring. This cannot be if the soil is wet, and it can hardly be the first year, if the soil is a very stiff clay, first brought under culture, but almost any other ground may sustain a fine garden if labor and manure be ungrudgingly applied at first. The amount of labor is really no tax, if the garden only gets the odd minutes which might otherwise be lost. The women of the family, from the wife to Bridget or Dinah, will rejoice in an occasional opportunity to gather up their dainty and do a little weeding. Bridget and Katharina will probably show unusual aptness at hoeing cabbages, cauliflowers, and Kale. Only take a little pride in starting the garden well, and the result will be favorable; for the excellence of its products, as soon as lettuce, early beets, green peas, and little sweet carrots, make their appearance on the table, will supply a motive to diligent continuance in well-doing. TheHints about Work in the Garden, on the third or fourth page of every number of the *Agriculturist*, are fresh every month, and constitute a safe guide for either the novice or the experienced gardener.

The Grape Vine—How it Grows and What to Do with it.—4th Article.

Though the proper season for pruning is past, we talk about the operation, as we wish to have this series of articles connected, and they will be useful for reference in autumn. If we have seemed to dwell too much upon a few elementary facts it is because of their importance. It has been attempted to explain clearly the parts of the vine, and to insist upon the point that all the fruit is borne by the green shoot that starts from the bud in the spring. If we leave upon a vine a dozen buds, we may have as many shoots, and if we cut all away but one bud, but one shoot will grow. No plant is more plastic, so to speak, than the vine, and the various ways in which it is trained are almost bewildering in their number. Yet, while it yields itself so readily to our will, there is nothing more obstinate and perplexing than an old and neglected vine. Whatever is to be done with the vine, it must be taken in hand when young, and have constant care, and an annual pruning. Last month we showed how to establish the vine by cutting it back each year, and growing a single shoot until a strong and vigorous one should be obtained. This might be continued indefinitely, but would give us very little fruit. The vine being well rooted and in vigorous growth, our object is to extend it, and the obvious way to do this is to allow more than one bud to grow. Let us take the simplest case for the next step, and suppose that this spring two buds have grown and formed two shoots. Next autumn the appearance of the vine will be that shown in figure 8—two canes, each like the single one grown the year before, and each, like that, furnished with buds. If it were desirable, the vine might be kept to two canes. To do this, the upper cane would, at pruning time, be cut entirely away, and the other cut back to two buds, which the next year would produce two more canes, and so on. To extend the vine a little more we cut each of the canes of fig. 8 back to two buds each. If neither of these four buds meet with

any accident during its summer's growth, the autumn appearance of the vine will be that shown in figure 9. The vine may be kept in this condition from year to year, and it is a very good system of pruning to follow where space is limited; it is often adopted for specimen vines where it is desirable to show a large number of varieties near one another, or for testing

Fig. 8.

Fig. 9.

new sorts. To keep the vine in this shape, the pruning is very simple; the upper two canes—the two that start the highest up on the stem—are cut away entirely, and the other two are cut back to two buds. The vine when pruned will appear as shown in figure 10, with four buds ready to furnish the four shoots for the next year. In practice it is customary to leave one more bud than is needed, and cut the canes to three buds. This is done for fear the upper bud may be winter-killed, as sometimes happens.

The superfluous third bud is removed in spring when all danger is over. A moment's thought will show how easy it is to extend the vine with four canes into one of eight. Instead of cutting away two of the four canes, as just described for the vine of figure 9, we cut all four back to two buds each. One who has read or seen something of vines will ask, "But where are your canes for wood and canes for fruit?" That belongs to another "system," and we have not reached that yet; we prefer to follow out the present one, and then take up another. It is to be understood that in the manner of treating vines as here described, the shoots will all produce laterals, and these must be pinched in the

Fig. 10.

manner shown last month. Shoots will, perhaps, start from the stem, for the vine produces adventitious buds, as they are called, i. e., buds out of the regular place. Shoots from these are sometimes useful to take the place of the regular ones that have been injured; but if all has gone well, these shoots are useless, and are to be rubbed off whenever they appear.

Ripe Grapes for Wine Making.

EXPERIMENTS AT KELLEY'S ISLAND.

On the grape islands of Lake Erie, the absence of autumn frosts allows the grapes to be left on the vines without injury until the latter part of November, and it has been a question of some interest among grape growers and wine makers, how much, if anything, is gained in the value of Catawba grapes for wine making, by allowing them to remain on the vines from two to four weeks later than the best time for picking the fruits for market—for it is found that Catawbas, like others, are of better quality and more sprightly in flavor, before "dead ripe."

To decide this question, the Kelley's Island Wine Company have made a series of careful experiments the past two years, the results of which are very interesting and conclusive. They are stated by Mr. Geo. C. Huntington, in an essay on the climatology of the region, read before the Lake Shore Grape Growers' Association, at its annual meeting in Cleveland, Ohio, a few weeks ago, which, in substance, is as follows:

On the 23d of Oct., 1866, the Company commenced buying grapes, and continued to buy daily until the 13th of Nov. The aggregate amount taken in was 103 tons, comprising 235 different lots, each one of which was sampled by pressing the juice from a part of the lot, and testing the gravity of the must by Oescule's scale. The result showed a gradual gain in the weight of the must, until the close of the season. The time covered by this experiment, however, was short—the vintage commencing later and closing earlier than usual—so that the results obtained were not as marked as in ordinary seasons covering double the length of time.

The past season, (1867,) the experiments were renewed under better circumstances, the vintage commencing on the 15th Oct., and continuing until the 29th Nov.—just six weeks; during which time the Company bought 350 tons of grapes, comprising 691 different lots, every one of which was sampled and tested separately in the same manner as in the preceding year, with the following results by the must scale: Average of the whole 691 lots.....83.25 deg. Average of 103 lots from 15th October to 19th of Nov., entire receipts of 1st five days.....80.06 deg. Or 3.29 degrees below the average of the whole. Average of 81 lots taken after Nov. 15.....83.13 deg. or 4.78 deg. above the average of the whole; thus showing an improvement in the quality of the must, of 8.07 deg., as compared with that pressed before the 20th of October—or a fraction over 10 per cent. To compensate for the loss in gross weight, which must occur from leaving the grapes so long on the vines, the price paid by the company was graduated according to the gravity of the must—those picked after the 20th of October bringing an average of ten per cent more than those gathered previously: which was considered as more than equivalent to the loss in weight. M. B. B.

TARRAGON.—This, the *Estragon* of the French, belongs to the same genus as the Wormwood, its botanical name is *Artemisia Dracunculus*.

It is a perennial herbaceous plant, and having a more slender growth than Wormwood, and bright green leaves, the resemblance to it is not very manifest until it comes into flower. The foliage is very aromatic with a peculiar fragrance when bruised, somewhat like Anise. It is used as a seasoning, it being highly esteemed by many in salads and in pickles. The tender shoots and leaves are used in the green state, and it is put into the vinegar to make Tarragon Vinegar. The plant is hardy and will grow in almost any soil. The seeds are very scarce, but we presume plants may be had from the nurseries. It grows readily from divisions of the root.

Treatment of Crotched Trees.

Young trees are sometimes so badly grown that a fork or crotch is formed, and they are, when old and laden with fruit, in danger of being injured by splitting. Last year we gave a method of treating such trees, which was to cut off one branch and straighten up the other. This of course could only be applied to very young trees. Mr. W. H. Barnes, of Iroquois Co., Ill., writes us, that he has come into the possession of an orchard, in which the trees forked very low, and that all danger from splitting had been obviated by the twisting together of opposite branches—of course when quite young—as shown in the engraving. We give this, not as a practice to be generally commended, but as an expedient that may be adopted with a badly trained tree that has become too large to be brought into proper shape. The same end may be obtained, as our correspondent suggests, by inarching branches to act as stays. It is a very easy matter, and altogether best, to properly train the young tree from the start with a well balanced head without a crotch, which is both unsightly and dangerous.

About Annuals.

Among those engaged in gardening, some consider annuals as a nuisance, while others would not willingly do without them. The number of "novelties" that appear every year with highly colored descriptions have so disappointed the purchasers that we do not wonder that they are tired of annuals. Yet with all this there is each year one or two added to the list of those that retain a hold on popular favor. Our advice to the novice, and those of limited means, always has been to let those better able try the "novelties" and stick to the old friends that have proved their worth. To the real lover of plants, there is a charm about planting the seeds, watching the first appearance of the plant, and caring for its future progress, that make annuals very attractive. In sowing annuals, do not sow too early nor too deeply. Wait until the ground is dry and warm,

and then sow thinly and cover lightly. The seeds of most are very small, and the young plant cannot force its way through a long distance of heavy earth. We have on several occasions given lists of those annuals we consider most desirable; at the present time we will mention a few, suited to certain purposes.

Certain kinds appear well only as specimen plants, grown singly, with ample room to develop, while others are most useful when planted in masses. For beds in lawns, where the plants are grown closely, nothing gives a finer show than Drummond's Pinks, which we now have in a great variety of shades. Then, what is gayer than a mass of Portulacas? And if one likes yellow, *Tugetes signata purpurea* is as beautiful as a yellow flower can be. This is good in the mass, or fine as single specimens; the yellow of the flowers is so modified by the great abundance of finely cut foliage, that the effect is not glaring. One of the best of late introductions is the Double Zinnia, which may be used with good effect in masses or as single plants. The *Nemophilas* are all beautiful, and look fine in a bed, but the trouble with them is, they do not last long. The Dwarf *Convolvulus* is a favorite with us; the blue is superb, and it is a great bloomer. This list of plants for masses might be much extended, but we wish room to enumerate the principal fragrant annuals. Among those prized for their fragrance, none is more valued than the homely *Mignonette*. There should always be a plenty of this, and of Sweet Peas and Candytuft; with these three and a little green, a pleasing bouquet can be made at any time. Sweet Alyssum, *Erysimum*, and all the Stocks, are fragrant, as are some of the Pinks. For ornamental foliage, we have among annuals, *Perilla*, *Cannas*, *Amarantus tricolor* and sanguineus, and the really elegant *Ricinus*, or Castor-Oil plant. The common kind is very showy, but some of the newer varieties, as the *R. sanguineus* are, when well grown, splendid.

What Evergreens Shall We Plant?

To the novice there is nothing more fascinating than a catalogue. Whether he is to plant fruit or ornamental trees, he looks the list over and over, and is not so much in doubt as to what to take as to what he shall leave out. He usually orders a lot of unsuitable stuff; of course a majority of the trees fail, and he at once sets the nurseryman down as a humbug. If all the beautiful evergreens were suited to all soils and climates we could make a list of most charming trees, but knowing the uncertainty that attends the most beautiful of this family, we are obliged to leave out the "novelties" altogether in making a selection for the general public, and fall back upon the old and well-proven sorts. Mr. Hoopes, in his recently published Book of Evergreens, gives the following good advice to novices, who had better leave *Cryptomerias*, *Cunninghamias*, *Deodar Cedars*, and such rare and tender plants, to those of more experience:

"To this class of planters we say, your first duty is to select such reliable kinds as the Norway Spruce, Hemlock Spruce, American Arbor Vitæ, Austrian Pine, White Pine, Scotch Pine, etc., adding, as inclination tends, a few other really hardy and desirable well-known species."

His list contains all that we should advise those inexperienced in tree planting to try, except the Red Cedar, for the West. Far inland this tree grows with a luxuriance and grace that is a wonder to those who are familiar with the slow growing and rather formal tree of the East.

Weeding and Thinning.

An excess of seed—at least of all the smaller kinds—is usually planted. Aside from the difficulty of sowing just the quantity needed to furnish the required plants, there are good reasons for the practice. With plants that are feeble at their first start, like carrots, a quantity of seed is needed to break through the weight of soil and insure a fair stand. When the plants are fairly up, then comes thinning, or, as the English call it, singling. How much soil each particular plant requires we do not know with precision, but doubtless most of our roots are allowed to stand too thick. The larger the leaves of the plant the farther apart the roots should be. Onions, with slender leaves, may be crowded, while beets do better grown far apart. It must be recollected that the development of the root depends entirely upon the amount of healthy, active leaf surface. But our intention was to impress the importance of attending to this matter of weeding and thinning early. Whatever tool or machine may be found useful for cleaning between the rows, there is a certain amount of work that must be done in the row itself. For this no machine has yet superseded the hand. The work must be done as soon as the plants have made a few "rough leaves," i. e., those beyond the seed leaves. There have been weeding hooks and weeding chairs, and other contrivances to facilitate the operation, but the best way is to go down on the knees astride the row, and work with both hands, thinning, and removing every weed, no matter how small. The operation of hand weeding may be facilitated by the proper use of the hoe; in working between the rows, the plants in the rows, weeds and all, are cut out at intervals, so as to leave little clumps or hills at proper distances. The amount of hand weeding is thus reduced, as the work is confined to these little hills. Do it early, for weeds grow as fast as the crops, and in a cold rain seem to grow much faster and get ahead of the crops and choke them. As soon as the plants are large enough to handle, go at them; delays are dangerous. Onions and carrots especially, need the earliest attention.

A CURIOUS HERACEOUS PLANT—TRICYRTIS.—Last summer Mr. Eugene A. Bauman, the well-known Landscape Gardener and Florist of Rahway, N. J., sent us a specimen of a plant under the name of *Tricyrtis pilosa*; we had seen the same thing in Mr. Peter Henderson's collection, called *T. grandiflora*. It was such a weird, peculiar looking flower that we had the engraving made which is here presented. The plant grows some two feet high, with hairy, light-green, strongly ribbed leaves, from the axils of which appear these singular looking flowers, which are white, copiously spotted with purple. While we cannot commend the plant as "beautiful" in the popular

sense, yet it is striking and curious in its appearance, and deserves a place in a collection of rare herbaceous plants. The genus *Tricyrtis* is a small one, and from Japan and Nepal. Botanically it would be placed in one section of the Lily Family, near our native *Uvularia*.

TRICYRTIS PILOSA.

A Variety of the Sweet Gum Tree.

The Liquidambar, Bilsted, or Sweet Gum, (*Liquidambar styraciflua*), is one of the finest among our native deciduous trees, and we have often called attention to its merits as a valuable

A VARIETY OF THE SWEET GUM TREE.

but much neglected tree for ornamental purposes. Last autumn we saw in the grounds of Mr. Joseph Longworth, near Cincinnati, a variety of this tree, of a very marked character. The specimen was, we believe, found growing wild by Mr. L., who introduced it to his grounds,

where it is in company with a remarkably fine collection of trees. The leaves in this specimen, instead of being of the five-pointed star shape, proper to the species, have only three prominent points, with one or two smaller ones, and are of the shape given in the engraving. The leaf-stalks, or petioles, are very long and slender, which gives to the foliage a peculiarly graceful and airy appearance. We could not learn whether the tree had yet borne fruit, but it would be very interesting to ascertain if this peculiarity will perpetuate itself, or the seedlings return to the original form. We hope that Mr. Longworth will see that so remarkable a variety as this is propagated and distributed, and would suggest *Longworthii* as a suitable name for it.

How to Transplant Evergreens.

All things considered, May is the best month for transplanting the majority of evergreens. While we have seen a screen of Norway Spruces successfully set in August, it was under such favorable circumstances as are not likely to occur to many, and we should not, from this one instance, advise summer planting. Just when the buds are swelling is the time when the tree seems most readily to recover from the shock of transplanting. Evergreens, as a general thing, do not seem to have the recuperative power of deciduous trees; they do not go into so complete a rest, and do not apparently awake with such renewed vigor. A well drained, not over rich soil suits the majority of these trees the best; let the soil be light, and use no manure. If the spot is very poor, make an excavation and get some good pasture soil to supply the place of that removed. The nurseryman must do his part of the work well, or no care on the part of the planter will save the trees. The roots must be kept from drying, either by a proper supply of damp moss, a puddling of clay, or both. Some of the dealers in young trees are

very successful in pucking, by making the roots into a ball with clay; this is, of course, to be soaked off before the trees are planted. Do not insist on large trees, especially if they are to come from a considerable distance. In planting, spread the roots well, and carefully cover with fresh soil. Do not plant too deeply, but allow for the settling of the newly moved earth, so that the tree shall stand no lower than it did in the nursery. Large stones over the roots are better than stakes, but stake if need be. During the summer do not let the weeds grow around the tree nor allow the grass to encroach upon it; keep a clear, open, well-cultivated space all around the tree. Much disappointment often results from buying native evergreen trees. These, especially Arbor Vites, sometimes succeed as well as nursery trees, but with Hemlocks and the more delicate ones, it is different. These should be put on trial one year, planting in a naturally or artificially shaded place.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Moths, Moths, Moths.

"How shall I preserve my furs?" "How shall I keep my woollens?" "What must I do with our nice stuffed sleigh back?" is the sum and substance of a considerable pile of letters from good housekeepers, who are anticipating trouble from that little household pest, the moth. Much of the trouble with moths arises from not knowing their ways, and the best thing we can do is to show up the enemy. In these pleasant spring days a little insect will often be seen flitting about the room, an innocent looking thing, of an unobtrusive drab color, which, if it attracts our attention at all, does so only pleasantly, as it seems full of new life, and in-

done. Where moths are once in a fabric, an exposure to a heat of 150° will destroy them. We once had some valuable traveling blankets that became infested; these we placed in a tight box and sprinkled freely with benzine, which did for the moths. Woolen sleigh coverings should be brushed over with a solution of corrosive sublimate, so weak that when it dries it will not leave a white stain upon the cloth.

The Big Pickerel and How it was Cooked.

The facts stated in the February *Agriculturist* in connection with the pictures of the pickerel, induced the friendly editor of the Jamestown (N. Y.) Journal to send us some statements in regard to the great size of the pickerel caught in Chautauqua Lake, and to verify them by a magnificent sample of the fish themselves. The fish sent exceeded the maximum length mentioned, being a

little less than three and one half feet. Its head measured 10 inches, its girth was 27 inches, and its weight 16 pounds. Mr. Bishop writes: "I might have sent one a quarter larger, but feared the flesh would not be so good. I saw one the other day that measured four feet, two inches, and weighed 33½ lbs. Two have been brought in that weighed 40 lbs. each, and measured 4 feet and 5 or 6 inches. Our Chautauqua Lake is fed by cold springs entirely, and the fish are much firmer and purer in taste than those taken in the streams around here. We stuff and bake large ones like Thanksgiving turkeys at our house. Small ones are nice fricasseed in cream, if you have cream."

The fish came in excellent condition, and was certainly the finest and largest we ever saw. It was weighed, measured, and divided. The head and shoulders were baked as follows: Cleaned, wiped out and off, sprinkled well inside with thyme, salt, and pepper, (not stuffed), spread out a little, and pressed flat, in a bake pan, the sides being tucked under; the whole was then completely covered with very thin slices of the best salt pork; a little water was put in the pan, which was placed in the stove oven. At the end of an hour and a half, it having been well basted, perhaps once in ten minutes, with the water in the pan, which was occasionally replenished with a very little more water at a time, the fish was ready for the table—brown and crispy on the surface, flakey and white within; solid and firm, yet tender and delicate as fresh fallen snow—but smoking hot. It was garnished with slices of lemon, and should have had a few parsley leaves, but the season has been unpropitious and our fine parsley is no longer thriving. The gravy, which was poured over it and surrounded it in the dish, was thymely and rich. The Fluke potatoes, simply boiled in their jackets, were the only accompaniment, and all sufficient. The roast joint which followed was neglected,—we were more than satisfied,—not too full for utterance, for the praises of the pickerel were the satisfactory theme of conversation then, and of agreeable memories now. And the Chautauqua pickerel were "marked up" far above common ones, and close along side of our very best table fish.—Other portions of the "big fish" were taken home by other editors, broiled and fried, etc., and a "good report" came back from each—with thanks to friends C. E. Bishop and Prof. Love for the superb present. We should all enjoy "casting a line" in Chautauqua Lake. The theory that fish furnish good brain nourishment, may account for the excellent quality of the Journal.

Keeping a Boarding House.

We have all laughed at the story of a man in New York who got rich and lived in an elegant house on Fifth avenue. An old friend from the country went to see him, and was shown over the house when several colored servants were eating their dinner. Being asked on his return how their old acquaintance was getting along, and what he was doing, he replied: "He seems to be doing well. He is keeping a negro boarding house." Are there not farmers who keep a boarding house? Ask the women. It is almost impossible to get girls in the country, and many well-to-do farmers who would gladly see their wives and daughters engaged occasionally at something other than cooking, are at a loss how to accomplish it. We can tell them. Do not board any men in the house. Put up houses for all the regular men you want, and make arrangements with them to board an extra man occasionally, as you may need him. There is no trouble about this, and it is a good deal cheaper than boarding men in the house. But in hiring the extra hands do not agree to board them in the other houses. Let them make their own bargains. Say, "I will give you \$30 a month, but I cannot board you. You can get board, however, with such or such a man." The object of this is to cut off all complaints in regard to the board. Pay good wages and try to make all the men, and especially their wives, comfortable, and you will have no trouble.

The money invested in a comfortable tenant house will pay a higher rate of interest than U. S. stocks. We know a man who pays a dollar a week for a house that did not cost \$300, and besides this agrees to work for the owner whenever he wants him. Such a system, however, is not a good one. You do not want rented houses for the farm. The cow, the pig and the chickens often cause trouble. Get good, married men, and furnish them a home, but not too many perquisites. Pay them good wages and make it an object to stay with you.

Home-made Photograph Frames.

"Adelaide," of Erie County, N. Y., sends us a very pretty frame, enclosing a Photograph, which is made by winding colored thread upon a piece of very thick pasteboard in the manner shown in the engraving. The star is 8 inches across from point to point. Rich brown thread, or other colors, the coarser the better, is selected, and ten rows of threads wound around two notches opposite to

Fig. 1.—THREAD PHOTOGRAPH FRAME.

each other, say from 1 to 4; then ten threads from 2 to 5; then ten from 3 to 6; and so on round and round until the whole pasteboard is covered. A pin thrust into each outer point, holds the threads from slipping off, and they are held securely in the inner angles by sewing a few times through the board, with a needle. The whole is simple, easily made, costs but a trifle for the thread, and is quite pretty. The open space in the center is an octagon just large enough for an ordinary photograph or carte de visite. They may be smaller. Frederick D. Parker, of Birmingham, Ohio, sends

A & B, LARVA IN AND OUT OF CASE, ENLARGED. C, PERFECT MOTH, NAT. SIZE.

dent only on its own pleasure. To use a vulgarism, "that's what's the matter;" this little miller or moth is great in its possibilities of future troubles. He, or she, (for the inexperienced eye cannot tell the difference,) should be killed at sight. Its first appearance should be taken as a warning of danger. The moths that trouble furs, woolen clothing, carpets, stuffed sleigh backs and furniture, may practically be considered as the same thing, for though the entomologist may find differences in them, their ways are alike. These winged moths deposit eggs on or in the furs or fabrics. These eggs hatch in about fifteen days, and the wool or fur serves the resulting worm, not only for food, but for clothing, for the grub makes itself a case out of the small fragments, and thus conceals itself while it works. It often happens that the presence of moths is not suspected until the mischief is done. After the grubs have made their growth, enlarging their cases to suit their needs, they go into the dormant state, and in spring appear as the modest winged insects to which we have referred. An engraving from a recent French work on the Metamorphoses of Insects, by Blanchard, gives the different stages of their existence. With moths, as with many other domestic troubles, prevention is the best "remedy." Camphor wood and cedar trunks are good, as the mother insect does not like their odor, and will not enter them. Cedar shavings, tobacco stems, camphor, pepper, and other aromatics, have the reputation of being preservatives, but there is nothing better than paste. See that the furs or woollens are well beaten, and put them away in a box or chest that has every crack closed by a strip of stiff paper well pasted on. Furs put up in perfectly tight paper bags, and pasted securely, will be preserved from the attacks of moths, but the paper must be without holes, and the pasting must be honestly

us a pretty frame constructed wholly of wheat or rye straw, cut and joined in the manner shown in fig. 2. The straws should of course be large and firm. They are easily shaped with a sharp knife, and then fastened with glue, or strong gum arabic, or other adhesive material. By applying black or other color to portions of the straw a very neat variegated frame is produced. The one sent to us is 6 inches high, and 4 inches wide, on the outside, but they may be of smaller size if desired.

Fig. 2. STRAW FRAME.

Household Talks.

BY AUNT HATTIE.

This morning was so bright and pleasant that I set Mary to clean the windows—and she has been at it all day, except for an hour at noon, when she prepared a simple dinner, and then cleared away again. Nothing adds so much to the cheerful and healthful aspect of a house as clear, bright window panes. We have had so much cold and freezing weather this winter that it has been impossible to keep them looking as nicely as we could wish. My neighbor, Mrs. B., says that she cannot understand how it is that we manage to find girls that are willing to do extra work, as she calls it. The trouble with her is this: when she finds that her house or windows need cleaning, she asks the girl in a half-frightened, hesitating tone, if she feels like doing it, and wishes she would clean this window or that for they are very dirty. Of course Bridget thinks that as the mistress appears to care so little about it, it is quite unnecessary for her to take much pains, and consequently the work is but half done, if done at all. Now, when I have made up my mind that certain work needs to be done, I accept the first convenient and pleasant day, and say to the girl in a firm, decided, but agreeable tone of voice, "Mary, I wish you to clean such and such a room to-day, or such and such windows; I want them thoroughly washed with clean, warm water and soap. I hope you will be very particular with the corners of the sashes, &c." I then provide for her use some good cleaning and drying cloths from a bag kept for this purpose. While the work is going forward, I occasionally inspect it, making such suggestions as may be necessary, thus teaching the girl something, and at the same time showing her that I take particular interest in the work itself. I have taken down the parlor lace curtains, intending to wash them and do them up again. I always attend to this matter myself, as they are quite handsome and I do not like to risk having them torn. The judgment of help is not to be relied on in such things, and the meshes of the lace may be easily torn through a little hard rubbing or too careless wringing. We have always been in the habit of soaking the curtains for two or three days previous to washing—changing the water (which should be warm) every day. It is astonishing how much of the dirt and yellow will be removed in this way, making it almost unnecessary to rub them much at the final washing. After coming from the boiling and bluing, they will be beautifully clean and white. I find a wringer indispensable for curtains, as it preserves the lace from breaking, and makes the starching process so much easier, and smoother in result. Many persons who have lace curtains for the first time are quite at a loss as to the proper way of getting them up when they become dirty, and many are the ludicrous attempts to iron them in the same way we iron those made of muslin. Of course the lace stretches entirely out of shape, and the work is abandoned in disgust. The proper way to finish them after starching is this: Prepare a large spare room by removing all the furniture, and sweeping and dusting the carpet very carefully. Spread the curtains one by one smoothly and evenly over the floor, and when all are done, lock the door and let them remain for a

day or two, or until dry. They will then be ready to hang again in the parlors. Some persons pin them to the carpet, but I prefer to merely spread them. If there is danger of the floor or carpet soiling them, clean sheets may be laid down first, but I have never myself found this precaution necessary. Edward and I took dinner with Mrs. S., yesterday. She is considered one of the best housekeepers in the town. Her house is delightful, and everything is kept scrupulously neat and clean, but I was much astonished at the singular manner in which the roast chickens were brought to the table. They actually stood on all fours. You laugh and say a chicken has but two legs, but these hapless creatures were allowed to use their wings for forelegs, and actually rested themselves in this fashion. The necks, instead of being neatly pushed under the skin and tied, were allowed to protrude frightfully. Their appearance was ludicrous in the extreme. Of course it was necessary to turn them on their backs before the carver could cut them up. I have seldom found a new girl competent to dress poultry or game properly for the table, but after showing her once or twice she is able to do so under my superintendence. I say under my superintendence, because I make it a point to see all the poultry prepared before my own eyes. There are so many little details of cleanliness to be observed that I prefer to do so, that we may eat with a better relish. The gizzard, heart, and liver, of a chicken intended to be roasted, should be removed carefully, cleaned, and set aside until the fowl has been singed and washed. With a sharp knife make a small incision in the flesh of each wing. Place the gizzard in one and the liver and heart in the other, bring them forward to the side of the breast, and pass the extremity of the wing backward in such a way as to turn the wing. Place one hand firmly on the breast, and with the other push the legs upwards towards the breast and under the wings, secure all together with skewers and a little string, sew up the lower incision, also the skin around the neck.—Turkeys may be thus dressed, omitting the gizzard and liver, which would be too tough roasted and should be reserved to make gravy.

Larger Yards About the House.

The housekeeper's department honestly extends a little outside of the house, where she plies her industries. This is conceded in many parts of the country, and she reigns quite as vigorously in the kitchen garden, the flower border, and the front yard, as in the kitchen and parlor. Every shrub and vine about the house she has planted, and every available spot between the front door and the gate bears the mark of her taste. Alas, that where land is so cheap, and flowers and ornamental shrubs so plenty, there should so often be no room to plant them! The great majority of farm-houses, even in the older parts of the country, stand directly upon the highway, and there is no protection for anything that might be planted. In many cases the yard allowed is not half the size of the house, even where it would not encroach upon the street. The first step toward improvement about these desolate homes is a larger space inclosed for ornamental purposes. The lord of the mansion often cares nothing about it, but the wife and mother does, and for the sake of her rising family she ought to have it. She is fairly entitled to a cheerful outlook from her window, a spot sacred to grass and flowers, where pigs and poultry do not intrude. The inclosure need not be expensive. Any thing that will turn cattle and allow the prospect of protection to the trees and shrubs that may be planted will do to begin with. Much display in fencing is not in keeping with the usual surroundings of a farm-house. We want to see trees, shrubs, and vines, much more than in the town. Once secure the place for planting and the planting will be likely to follow. We hope to see a general movement on the part of our housekeepers this spring for the enlargement of the yards about their houses, for the reason that if they do not move in it, it is not likely to be done—at least not very thoroughly.

How to Put Out Clothes on Fire.

When clothes take fire from the upsetting of a lamp, or other accident, severe burns are made, or life is lost, for want of proper action. The first impulse of the burning person is to cry out in the fright, and to run to the open door, which only fans the flame; and the bystander generally tries to put out the flame with his bare hands. A little presence of mind will save great injury and suffering in such cases. If the blaze is but just started, it may be subdued by falling instantly upon the floor and thrusting the burning part of the dress under the person. One standing by at such a time should seize a woolen blanket, shawl or cloak, or any woolen fabric at hand, and spreading it out higher than the head, run boldly to the unfortunate person, throw his arms about the neck and envelop him or her in its folds as tightly as possible. This instantly smothers the fire and saves the face. Throw the person upon the floor immediately, and the moment of greatest danger has past.

If the burn is severe, a physician should be called at once, but in the mean time something may be done to relieve the pain. One of the most soothing applications is a liniment made of one part of raw linseed oil and two of lime-water, applied on cotton. In the absence of these materials cover the parts freely with flour and put over a coating of cotton to exclude the air. Putting the burned portion in cold water affords a momentary relief, but interferes with the future recovery from the injury.

Dressing for Salads.

Most people relish a nice salad at this season of the year, and it would be still more prized if the needed dressing were at hand. The essential ingredients are: good cider vinegar, pure mustard, fresh eggs, and sweet oil made of olives—not of lard. Begin with a teaspoonful of dry mustard in a soup plate; add nearly an equal quantity of salt, a little vinegar, and beat to a paste; then add the yolk of a fresh egg, and after thoroughly rubbing and mingling all with a silver fork or spoon, add about half a tablespoonful of sweet oil, and stir until it is smooth. It will probably then have a shining, greasy look; add a few drops of vinegar, and it will, when stirred, at once thicken up, and lose the greasy look entirely. When all is smooth and uniform, add more oil, and again, a very little vinegar, if necessary, to produce the same effect. Our rule is to add as much oil as we can cause to be entirely taken up, and to stop before either the addition of more oil or vinegar will cease to thicken. The dressing should be smooth as whipped cream, and this, indeed, thoroughly beaten up with the white of the egg or eggs, is an addition to the dressing which increases its delicacy and deliciousness. In a good salad dressing the oil loses its oiliness, but pervades the whole with its flavor, and while the sharpness of the mustard, salt, and vinegar, entirely disappear, each ingredient adds a peculiar piquancy to the agreeable compound, which by contrast only heightens the crispy freshness of the lettuce, and brings out its flavor. The egg may be omitted, and you will still have a nice dressing, if the oil is good. Lettuce, water cress, endive, and celery, make fine salads. Dandelion, sorrel, and some other plants, are occasionally used. Salads are very appetizing, and may well have a place every day upon the table. Sweet dressings and cooked salads are not to our taste; many, however, like them.

Recipe for Salad Dressing by Mrs. A. M. Herr.—After every possible precaution has been taken by careful picking and thorough washing, to have the leaves free from sand or soot, I prepare a dressing by adding to a pint of water and vinegar, a tablespoonful of sour cream, a tablespoonful of sugar, a pinch of salt, and a well beaten egg. Then when this mixture is boiling, I pour it over the lettuce leaves, they having been well drained, and cover in a close fitting tureen, for two or three minutes. If the lettuce is not very tender the dressing may be poured off, and again boiled and applied. This quantity is for six persons.

BOYS & GIRLS' COLUMNS.

The Restless Blue-bottle Fly!

Whiz! Buzz! Buzz! A great blue-bottle fly came dashing into the open window, and blundering about the room where little Frank was sitting and pouting because he did not know what to do with himself. One would think he could have found play enough with all the toys scattered around him, or pleasure enough in the bright picture books that lay on the table, or work enough with his little axe, hoe, and wheelbarrow, which stood under the window outside, near the garden, to have covered his face with smiles and filled his heart and his eyes with sunshine. But there he was with a cloudy frown on his face, and a rainstorm of tears threatening to gather in his eyes, when the big blue-bottle made him forget himself by its loud hum and its queer freaks. Away it darted, and banged its head against the window pane—its brains would have been dashed out, if it had any; it circled round and round the room, then went flumming into every corner, as though hunting for something it could not find; next it came pounce upon Frank's nose, making him start and strike at it, but it was already away and beating its wings violently to brush off a cobweb in which it had entangled itself; luckily it was an old net, which the spider who made it had left, or that would have been the end of poor blue-bottle. "What an uneasy fly you are," said Frank, "why can't you be quiet? Wasn't there enough to look at out doors, that you must come poking in here? Now you have done it, you silly thing!"

he continued, as the fly after breaking loose from the cobweb, and buzzing about a little, darted straight into a cup of dissolved gum with which Frank had been mending his kite. It struggled to the edge, with its wings fastened down, its body besmeared, and in altogether a pitiable plight. Frank watched it a few minutes, and then threw it out of the window, to help itself as best it might. Then his uneasy feelings came on again. "What shall I do?" murmured he. "I wish I had a willow whistle, like Ed. Jones's." There was a nice ivory whistle in his pocket, which his cousin had given him a few days before, but that was not a willow whistle. After thinking a few minutes he slowly sauntered out of the house and through the garden. He had a plan in his head now. There was a swamp not far from the house, where willows grew. He had been forbidden to go there, for the mud was deep, and the bogs gave a very insecure footing; but no harm would come of it, he thought; he would take care of himself, he said. He passed safely from one bog to another, cut a nice, smooth, willow stick, and returned nearly to the firm ground without accident, but at the last jump his foot slipped, and down he went floundering in the mud. Fortunately he was able to crawl out, but he was a sorry figure to look at; his nice clothes were plastered with filth, his face smeared, and his hair matted together. He had a good washing and was put to bed by his mother on his return home, and there he was obliged to lie the remainder of the long day, thinking over what had happened. Singularly enough a blue-bottle fly, perhaps his old acquaintance, came buzzing into the room to sympathize with him, and perhaps this helped to cure him of restlessness, for he seemed to be almost entirely contented with the abundance of good things around him for a long time afterward.

Tommy's Troubles.

WRITTEN FOR THE AGRICULTURIST BY SARAH E. DONMALL.

With a scowl upon his face, and tears in his eyes, Tommy sat in a chair, creaking to and fro in a very violent manner. The old chair creaked and creaked, and seemed to have half a mind to throw him backward.

Just then Aunt Lottie came into the room, and with much surprise asked him what was the matter. "Oh!" said Tommy with a groan, "I have so much trouble!" "Trouble!" repeated Aunt Lottie, "what in the world should trouble you?" "Well," said Tommy, "in the first place, I have lost my knife, and that troubles me. And my old Seabright hen that is setting, keeps jumping on and off her nest, and I don't believe she will hatch a chicken. Now, I think these are troubles enough for any body." And the old chair creaked, and creaked again, while the tears ran down Tommy's cheeks faster than ever.

"Let me tell you how to get rid of these troubles," Aunt Lottie gently replied. "In the first place, the loss of your knife can be replaced, although it may take all your money to buy another; yet this will teach you to be more careful in future, and also to remember, that many of our troubles come upon us through our own carelessness. Now, suppose, by some accident one of your eyes had been put out, or you had lost both legs, like the poor soldier we saw in the hospital; then you would be obliged to sit in a chair, week after week, and no amount of money could replace them." "Oh dear!" exclaimed Tommy, "I would rather lose my knife than my legs any day." "But how are you going to get over the trouble about the old hen?" asked Tommy. "Oh very

easily," replied Aunt Lottie. "You are not certain the hen will leave her nest; perhaps she will mend her ways in future and stay at home, and then you will have had all this worry for nothing; and if she should not hatch a chicken, you cannot help it. She may set again in a few weeks, behave like a good, sensible mother, and hatch as many chickens as you desire. So never be discouraged; but always try to believe that whatever happens is for the best. If we could really make ourselves believe this, we should never be very unhappy about anything."

"Ah!" exclaimed Tommy, "you can never persuade me that it will be for the best, if my old Seabright leaves her eggs." "Perhaps I cannot," replied Aunt Lottie, "yet it may be for the best, in spite of your unbelief. I remember once reading of a lady who had a necklace stolen from her, and it was the means of not only making her very happy, but many others also; and if you would like to hear it I will tell you the story."

"In an eastern country there lived a king, whose name was Ismail Saminee. He, with his army, had laid siege to and taken the city of Hierat. Ismail had promised the inhabitants that he would not destroy the city or take their money from them, as he was a pious, just man, and would not do anything to oppress them. His soldiers, being in great need of money, clamorously demanded that he should levy a tax on the city, but Ismail refused, and lest he should be tempted to violate his word, ordered his army to march away, and encamp a long distance from Hierat. One day a vulture, hovering over the tents, espied a ruby necklace, that belonged to one of Ismail's ladies. Mistaking the redness of the stones for meat, he made a swoop at it, and carried it off. The flight of the vulture was watched, and he was seen to deposit it in a dry well, and with this being searched, the jewel was recovered, together with several boxes containing great treasures, that had been hidden there by a robber."

"With this money Ismail satisfied his soldiers, who no doubt had thought themselves very ill used, just as you feel in not having your own way; and the lady must have felt quite as sorry to see the vulture carry off her necklace as you did to lose your knife. But you see it all happened for the best, as it was the means of more than supplying all the wants of Ismail's army, and the lady gaining more jewels than she supposed she had lost."

"Well!" said Tommy, rubbing his eyes, "I think I feel better, Aunt Lottie, and when I have any more troubles, will try to remember what you have told me; and the scowl disappeared from his features, and the old chair was not heard to creak any more for a long time."

The Chin Fever.

This affection is usually prevalent among boys from fifteen to eighteen years old. You don't know what the chin fever is, perhaps. The first symptoms are a frequent inclination to pass the hand over the chin, sometimes over the upper lip. The sufferer has an expression as though impatiently expecting something, which delayed in coming. He will frequently gaze carefully into the looking glass, as though it were the mirror of fortune. As the trouble increases the afflicted boy may be seen stealing away to some retired place and striving to get a little ease by applying strong compresses to his face; so anxious is he sometimes to get rid of his trouble that he has been seen to threaten to cut his throat with his father's razor. As usual, the quack medicine dealers take advantage of persons in such trouble, and advertise compounds warranted to cure the worst cases in from three to six weeks; but their applications only aggravate the symptoms, and cause more frequent turnings to the glass and more violent manipulation of the face. It is a relief to know that this trouble is not fatal, and disappears gradually as the beard grows, though we have known cases where some of the symptoms, especially passing the hand affectionately over the face, have remained through life. The best treatment for the patient, perhaps, is to let him alone, as advice in such cases usually aggravates the complaint. If any, however, should really wish to know what to do with the beard when it first appears, we answer, let it alone until it becomes unsightly, then trim it. Too early and frequent shaving will make it troublesome in after years; if not abused by continuous cutting it will be more likely to remain soft and silky.

Potatoes a Great Luxury.

Our friend, Mr. B. K. Bliss, the well-known seedman, relates the following: Last fall a gentleman of Springfield, evidently a man of good taste, described to Mr. Bliss some potatoes he had raised, greatly praised their excellent qualities, and told Mr. B. that he ought to try and procure a quantity to sell for seed, promising to send him some to test. Nothing more was said on the subject, however, until this spring, when the gentleman informed Mr. B. that the potatoes were so very fine, his family had used them all through the winter, and he regretted not being able to furnish any, as he had intended. Shortly after this the gentleman received a note from the man

who had at first let him have the seed for his fine potatoes, saying he had better keep all he had on hand of that kind, as they were the celebrated Early Rose variety, which Mr. Bliss, the seedman, was then selling at one dollar per pound. The gentleman, who had not before known the name of his favorite potato, felt that he had been rather extravagant in indulging in so costly a luxury; however, he made the best of it, and enjoyed the practical joke which had been perpetrated at his own expense.

Answers to Problems and Puzzles.

The following is the answer to the puzzle in the April number, page 149: Truth, honesty, and industry, go hand in hand with peace and prosperity.... The following have sent correct answers to some of the puzzles published in previous numbers: L. M. Wright, John King, Theodore Ascherfeld, F. W. Klesge, J. M. Rodkey, A. Landon Root, George M. Dell, Edward B. Crafts, Willie Cundell, F. C. Marion, John Ed. John Austin, F. B. Dawson, Henry E. Nelson, Mary C. Woodward, J. H. Brush, W. J. Bowman, Chas. B. Kellogg, J. F. Tillinghast, J. D. Odell, Carrie E. Seiford, Wm. A. Smith, Wm. K. Amndt, A. J. Tucker, A. J. Underhill, Walter Helms, Lizzie Surface, Willie W. Rapert, Mrs. C. P. Norton, Jennie Flora White, C. V. Brulley, F. W. Griswold, L. E. Irwin, Alfred Woolley, Sarah Morley, Mollie J. Doggell, A. N. Daniels, Frances H. Englebert, S. Jennie Fahn, "Hooster" Wilson, K. Hasbrouck, Oscar W. Baker, Mina M. Walker, Willie McMoran, George F. Benson, E. J. Bushnell, James Rose, J. Van Winkle, W. P. Gale, K. A. Greason, Chas. Hasbrouck, Wm. Brockway, Mary Wilkinson, David McNeil, Alice Clemans, Effie Belle Ladlow, Daniel W. Letzler, C. G. Holloway, Addie and Frank Ferris, Geo. B. Stoum, Wm. R. Potter, Wm. E. Davis, Cornelia E. Harvill, Ebenzer J. Bridge, B. O. Whittemore, Charles Weber, Lorrin Morrison, Bridgewater, Wm. Reynolds, H. Sichelmay, Sanford Horton, Hattie E. Hawley, Horace Cook, J. E. Wittmore, J. H. J. A GREAT NOISE IN THE BARN. — Drawn and Engraved for the American Agriculturist.

What this cat has to complain of, we do not know. It will be pleasant for our young friends to discuss the matter in the home circle. Perhaps rats are scarce in the barn where this singular meeting is held, and the chief of the family is advising some of the younger ones to emigrate. Perhaps he has found some good text in the *Agriculturist*, and is ex-pounding upon it. More likely he is a restless, hungry wanderer, who wants to stir up contention among the sleek, well-fed community, that he may profit by their quarrels; two of his audience are already snarling over their supper. If this be the case, he was probably brought up by some low politician, and learned from him one of the common tricks of the trade. We cannot tell from his looks whether he is a Republican, a Democratic, or a Woman's Rights cat. We leave our readers to make their own guesses on these and all other points, and thus have their own fun over the picture.

Only a Little Sunbeam.

A beam from the setting sun darted swiftly through the air, glanced through the window pane, and made a golden spot upon the carpet where a child was sitting. The little one had been peevish and fretful, and his mother was weary with trying to soothe him. But as he saw the bright sunbeam and strove to grasp it with tiny fingers, he looked up with a smile, as though the light had entered his own heart and shone forth from his face. In an instant the mother's heart responded with gladness, and, pressing the babe to her breast, she covered it with kisses. Just then the father looked in. All day he had been harassed by business cares; many things had gone wrong, debtors had disappointed him, some of his workmen had been unfaithful, and a gloomy frown rested upon his brow. But the light of the sunbeam which had cheered

the mother, now chased the clouds from his sad face, and a happily spent evening followed by refreshing sleep gave him new vigor and a kinder heart for his work on the following day. The poor newsboy to whom he gave an extra price for his morning paper felt some of the warmth which the sunbeam had imparted; an unfortunate debtor wondered at the change which a single night had made, when his account was so arranged that it should not crush him; and the clerks declared it a pleasure to work when their employer was so cheerful. So the little sunbeam was not lost, although it shone but for a moment.

Poor Taste.

"What's the price of butter?"—We overheard this inquiry a few days ago at one of our city markets, and turned to look at the speaker. She was expensively dressed, and took no pains to conceal half a dozen showy and probably expensive rings upon her fingers. The dealer of course showed her a good article, at sixty cents per pound. "Got any cheaper?" asked the woman. (A lady would have said "Have you," instead of *got*.) Samples were shown at fifty-five cents, then at forty-five, and finally the lowest priced article at forty cents. It was very *powerful* butter—a soif of it left an unpleasant memory for a week—but it suited the customer, and she purchased several pounds—perhaps to feed the sufferers at a cheap boarding-house, perhaps for the servants in her kitchen. We couldn't help thinking of those rings and that better.

A few days ago, the agent of an accident insurance company entered a smoking-car on a Western railroad-train, and approaching an exceedingly gruff old man, asked him if he did not want to "take out a policy." He was told to get out with his policy, and passed on.

After riding about half an hour, an accident occurred to the train, and the smoking-car ran over the sleepers, causing much consternation among the passengers. The old man jumped up, and, seizing a hook at the side of the car to steady himself, called out, "Where is that insurance-man?" The question caused a roar of laughter among the passengers, who for the time forgot the danger,

What it Cost.

A gentleman in business in this city has for years made a practice, which is common with many, of inviting his customers and friends out to "take a drink" or a cigar. A friend endeavored to convince him that he was spending too much in this way, aside from other and stronger objections to the practice. The gentleman insisted that the cost was a mere trifle, but to make sure of it he adopted the following plan: Each time he spent any thing for this purpose, he deposited an equal amount in a box in his safe, keeping no account of it. At the end of three months he counted this deposit, and found there, to his astonishment, over *three hundred dollars*. The friend who related the incident to us said he had just left the surprised man, who was still looking at the pile of bills and thinking deeply. Perhaps he was reckoning the amount of comfort and pleasure the sum would have brought to the home circle, if properly used, or how it would have helped in taking up some note when he was "short." Probably he has received some new ideas which will do him much good, and not injure his customers.

Wear your learning, like your watch, in a private pocket, and don't pull it out to show that you have one; but if you are asked what o'clock it is, be ready to tell it.

PAISIAN HONORS.—We submit the following to our readers. Comment is unnecessary: "At the Paris Universal Exposition, Messrs. WHEELER & WILSON, 625 Broadway, received the **Gold Medal**, and the **only one**, awarded for the most perfect Sewing-Machine and Button-hole Machine exhibited.

J. C. DERBY, New York,
U. S. General Agent for the Exposition,"
HENRY F. Q. D'ALIGNY,
Member of International Jury and Reporter of same."

THE BEST INVESTMENT

a Farmer can make is to subscribe for
THE NEW YORK TRIBUNE.

It pays larger and more certain
DIVIDENDS
than any

RAILROAD STOCK,
BANK STOCK,
CANAL STOCK,
BRIDGE STOCK,
OR TURNPIKE
OR MILL SHARES.

Each number will tell him not only how to make money,
but how to keep it and use it to his greatest advantage, so
as to provide

HIS OWN COMFORT,
HIS FAMILY'S COMFORT,
HIS NEIGHBORS' COMFORT,
and insure the
WELFARE OF HIS LIVE STOCK,
the Preservation of Manures and Tools, and the general
prosperity of
HIS FARM AND HOUSEHOLD.

TERMS OF THE TRIBUNE.

DAILY TRIBUNE, Mail Subscribers, \$10 per annum.
SEMI-WEEKLY TRIBUNE, Mail Subscribers, \$4 per annum.
Five copies or over, \$3 each; 10 copies, \$45.

WEEKLY TRIBUNE, Mail Subscribers, \$2 per annum.
5 copies, \$9; 11 copies, \$13; 21 copies, 10 copies, \$24;
\$24; 31 copies, 10 copies, \$32; 51 copies,
to one address, \$30; 51 copies, to names of subscribers, \$35.

ADVERTISING RATES.
DAILY TRIBUNE, 25c, 30c, 40c, 60c, and \$1 per line.
SEMI-WEEKLY TRIBUNE, 25 and 50 cents per line.
WEEKLY TRIBUNE, \$1.50 and \$2 per line.

According to position in the paper.
Terms, cash in advance.

Address, THE TRIBUNE, New York.

HERALD OF HEALTH.—Don't fail
to get this Magazine for 1868. See full programme in
March No. of the Agriculturist. Remember that we give to
each subscriber who sends 25 cents extra a beautiful Steel
engraving of Lincoln at Home, 1824 inches, or one of Gen.
Grant, same size, both beautiful ornaments. Also, a Wheeler
& Wilson Sewing Machine worth \$35, for 50 subscribers and
\$60, \$3.00 a year; 25 cents a month. ALDER, WOOD &
CO., 15 Light-st., New York.

PATENT OFFICES.

Inventors who wish to take out Letters Patent are advised
to counsel with MUNN & CO., Editors of the *Scientific Ameri-*
can, who have prosecuted claims before the Patent Office
for over Twenty years. Their American and European
Patent Agency is the most extensive in the world. Charges
less than any other reliable agency. A Pamphlet containing
full directions to inventors is sent gratis.
A handsome Bound Volume, containing 150 Mechanical
engravings, and the United States Census by Counties,
with Hints and Receipts for Mechanics, mailed on receipt of
25 cents. Address:
MUNN & CO., 37 Park Row, New York.

"FIGHTING AGAINST WEAR,"
and for
"THE GOOD, THE TRUE and the BEAUTIFUL."
THE
Little Corporal
Is acknowledged by Press and People almost universally
to be THE BEST PAPER for Boys and
Girls ever published in this country.
It is edited by ALFRED L. SEWELL, and
EMILY HUNTER MILLER.
Volumes begin July or January. Back No. supplied.
Terms, one Dollar a year; Sample copy ten cents.
GREAT INDUCEMENTS are offered to those
who wish to subscribe.
Address, ALFRED L. SEWELL, Publisher,
CHICAGO, ILL.

"A GOOD THING."—HOW TO GET IT?—
"Would you know what you can do best? What
calling or pursuit to follow in life? And how to make the
most of yourself? Read the **PHRENOLOGICAL JOURNAL**. It
has a very large circulation, is now in the 4th vol.; and only
\$3 a year. The Journal and Agriculturist, \$3.50. Address
S. R. WELLS, or ORANGE JUDD & CO., New York.

A NEW CLASS IN PRACTICAL PHRENOLOGY
is forming. For Circular with full particulars address,

WANTED IN BUYING.

WANTED IN SELLING.

Shaler's Family Scales

Are adapted to meet a great want in everyday life. They are
especially designed for the use of families in towns or farmers
in the country, and are equally well adapted for all ordinary
purposes of weighing. THE SHALER FAMILY SCALES
ARE INDISPENSABLE TO THE HOUSEWIFE. They are
used without weights; the pounds and ounces of any sub-
stance placed in the pan are instantly and accurately indicat-
ed upon the dial, as plainly as the hours and minutes are
shown upon the face of a clock. Upward of two years' con-
stant use has proved their entire ACCURACY and DUR-
ABILITY. Three sizes are now offered as follows:

To weigh 50 lb. to 12 lb. price.....\$3.50
To weigh 5 lb. to 25 lb. price.....4.50
To weigh 1 lb. to 60 lb. price.....6.50

Thorough Canvasers were sent in every town and county in
the United States and Canada, to whom exclusive right of
territory will be given. Liberal discounts made. Nothing
so well adapted to the purpose has ever before been offered,
and they meet with ready sale. Agents are making from \$10
to \$30 per day. Samples sent on receipt of price. Orders
from foreign countries solicited.

Manufactured by J. W. NASH & CO., 18 Howard-st., New-
Haven, Conn., from which place all goods are shipped.
Address ALVAH BUSHNELL, General Agent,
No. 32 Cortlandt-st., New York.

THE UNIVERSAL CLOTHES WRINGER

IMPROVED WITH

Rowell's Patent Double Gear,

and the New Clean Extension. The only Wringer having
the latest **STOP**, without which Groceries by out of
gear, and are of no use when most needed in wringing large
articles.

Canvasers and the trade West supplied from our Depots
in Chicago and St. Louis.

Large discounts to the trade everywhere. The celebrated
Dory Washing Machine sold also.

R. C. BROWNING, General Agent,
Wringers of all kinds repaired. 32 Cortlandt-st., New York.

COLGATE & CO'S AROMATIC VEGETABLE SOAP,

Is particularly adapted to the delicate Skin
of Females and Infants.
Sold by all Dealers in Perfumery and Toilet
Articles.

American Waltham Watches.

THE BEST! THE CHEAPEST!

Recommended by Railroad Conductors, Engineers, and
Expressmen, as superior to all others for steadiness, strength,
accuracy, and durability.

Unscrupulous Dealers occasionally sell a worthless Swiss
imitation. To avoid imposition, buyers should always de-
mand a certificate of genuineness.

For sale by all respectable dealers.

Ask for a Waltham Watch, and take no other.

IT IS THE BEST. IT IS THE CHEAPEST.

C. O. D.

AMERICAN (WALTHAM) WATCHES.

Now universally acknowledged the **Best and Cheapest**
Watch in the WORLD.

I will send to any address by Express a genuine WAL-
THAM WATCH, Chronometer Balance, Extra Jeweled, and
in fine Silver Case, for \$2.25, to be paid on delivery, accom-
panied with certificate of American Watch Company, guar-
anteeing it to be in all respects as represented. The buyer
to have privilege of examination in the possession of Ex-
press Company. The purchaser is reminded that the price
named is only a small advance from that asked for the bogus
watch of unknown make, of no real value and dear at any
price, and manufactured only for the purposes of fraud and
deception, necessarily sold under fictitious names, and in
such manner that the real swindler's name continues wholly
unknown, and consequently redress becomes impossible.

Name and address must be distinctly written. Buyer to
pay Express charge. Address

EUGENE BADGELEY, No. 137 Fulton-st., New York

PRICES REDUCED For Woodruff's Improved Portable BAROMETERS.

\$10, \$15, \$18, \$25.

NEW METHOD OF
WASHING CLOTHES
WITHOUT LABOR.—The Automatic
Clothes Washer and Boiler. Rev.
M. W. STAYLES, Inventor and
Patentee. This boiler is self-act-
ing, and dispenses with labor and
the wear of clothes. The hot water
and steam by the action of heat,
are poured upon and forced
through the clothes, for the removal of
300 gallons in 20 minutes, cleansing them perfectly without
rubbing. It has been thoroughly tested and pronounced un-
der a clothes washer as a clothes washer.

No. 5, medium size, will fit any Stove or Range. Price \$10.
Good canvasers and Agents wanted for every town in
Eastern and Middle States. Liberal opening for enter-
prising men. On receipt of price sample boilers sent to any
address. Send stamp for Circular.

AUTOMATIC CLOTHES WASHER & BOILER CO.
P. O. Box 658, General Agency, No. 19 Cortlandt-st., N. Y.
State and County Rights for Sale.

To Dealers and Large Planters.

Encouraged by the greatly increased demand for our
Vines and Plants, we are growing an immense stock of
the best quality for Fall Sales, which we will furnish on
most favorable terms. Our manner of growing stock en-
ables us to meet the requirements of dealers in the early fall.
Parties interested would do well to correspond with us at
once. Our stock includes **Grape Vines, Strawberry,
Raspberry, and Blackberry Plants; Gooseberry
and Currant Bushes** of every desirable variety.

J. K. NIX,
Box 155, Pittsburgh, Pa.

ONE OUNCE OF GOLD.

Will be given for every ounce of adulteration found in
"B. T. BARNETT'S LION COFFEE." This Coffee is roasted,
ground, and sealed hermetically under letters patent from
the United States Government. All the "Arson" is
saved, and the Coffee presents a rich, glossy appearance.
Every family should use it, as it is fitter to twenty per cent
stronger than other pure "Coffee." For sale everywhere.
If your grocer does not keep this Coffee, and will not get it
for you, send your orders direct to the agent.

B. T. BARNETT,
Nos. 64, 65, 66, 67, 68, 69, 70, 71, 72 and 73 Washington-street,
New York.

Waterman's Patent Cast Iron Roll Pans

For baking *French Rolls, Gems, Pop Overs, Corn Bread,*
etc. The best article in the market. See editorial notice page 25
in Jan. No. of Agriculturist. Manufactured and for sale by the
owners of said patent, **RICHES & ELWIN MANUFACTURING CO.**
New Britain, Conn., and at their warehouses in New York,
Philadelphia, Boston, Baltimore, and San Francisco.

Inquire for Waterman's Patent Bake Pans. Recipes fur-
nished with the pans.

Dealers please send for Illustrated Circulars.

SECRET SAFES,

Secure against Fire and Thieves, for the safe keeping of val-
uable papers, jewels, etc. Unprotected women, feeble men,
families living in lonely places, and all others, should secure
their valuables in these Safes. Send for circular. Agents
wanted.

For sale by
SECRET SAFE COMPANY, No. 25 Broadway,
Opposite City Hall, New York.

GOLD MEDAL
1867.

**CROSS OF THE
LEGION OF HONOR**
1867.

GOLD MEDAL
1867.

Walter A. Wood's "Prize" Mowers and Reapers ARE TAKING THE LEAD.

Triumphant at the Paris Universal Exposition, 1867. Two Grand Gold Medals and the Decoration of the "Cross of the Legion of Honor" conferred by His Majesty, Emperor Napoleon, upon the inventor, WALTER A. WOOD.
First Prize—GOLD MEDAL—at Great National Field Trial held at Auburn, N. Y., in 1865.
First Prize at Grand State Trial held at Rochester, Minn., August 20th, 21st, 22d, 23d, 1867.
Together with over 150 first prizes in other contests.

Over 90,000 manufactured are now in use in Europe and America. The demand in 1867 greater than the supply. Increasing demand with increased facilities for manufacturing for the coming season, 1868.

WOOD'S "PRIZE" MOWER, retaining all its popular advantages, is improved by valuable additions.
WOOD'S SELF-RAKING REAPER, easily managed, of light draft, is the "Victor of Every Contest," and forms, with the new Mowing Attachment, the most perfect combined machine in use.

WOOD'S HAND-RAKING REAPER, readily changed from Reaper to Mower, and vice versa, recommends itself.

HAINES' ILLINOIS HARVESTER, especially adapted for the West, is made of good materials, and gives satisfaction.

Manufactured by the **WALTER A. WOOD MOWING AND REAPING MACHINE CO.,**
Hoosick Falls, N. Y.

SEND FOR NEW DESCRIPTIVE CIRCULAR FOR 1868.

CLIPPER MOWER & REAPER.

This CELEBRATED and UNRIVALLED machine is manufactured by **The Clipper Mower & Reaper Company**, at their works at YONKERS, N. Y., where they have unsurpassed facilities for the business. The Machine needs no consummation. Farmers throughout all sections of the country who have used it, are ready and willing to testify to its great superiority for all work, combining, as it does, more points of excellence than any machine yet made.

Its principal characteristics are:—SIMPLICITY OF CONSTRUCTION, DURABILITY, EASE OF DRAFT, PORTABILITY AND COMPLETENESS OF FINISH IN ALL ITS PARTS.

These Machines are of Four Sizes, to meet the wants of any farmer, as follows:

No. 1. One-Horse machine (21 in. wheel, 3 1/2 feet swath).
This Machine took the First Premium & Gold Medal, at the Great Trial at Auburn, N. Y., July 1864, and is the only practical One-Horse Machine in Market.

No. 2. Two-Horse (medium) 29 in. wheel, 4 feet swath.
No. 3. (Heavy) 32 in. wheel, 4 1/2 feet swath.
No. 4. (Heavy) 36 in. wheel, 5 1/2 and 6 feet swath.

Made also as a Combined Mower and Reaper.
Address: **THE CLIPPER MOWER & REAPER CO.,**
Nos. 12 & 14 Cliff St., New York City.

The American Hay Tedder.

THE BEST and only perfect machine ever invented for turning or tedding Hay.

Hay cut, cured, and stored in the Hay in One Day!!
THE QUALITY OF THE HAY CROP VERY MUCH INCREASED.

Very Great Ease of Draft.
It is very LIGHT, and so SIMPLE and DURABLE that it CANNOT GET OUT OF REPAIR.

BURT'S SELF-ADJUSTING HORSE HAY RAKE,

MORE SIMPLE, MORE DURABLE, and EASIER OF OPERATION than any other HORSE RAKE in the Market.

MADE ONLY BY **AMES PLOW COMPANY,**

Quincy Hall, Boston, Mass., and 53 Beekman St., New York.

Send for Illustrated Circular.

THE EUREKA MOWER.

THE GREAT DIRECT DRAFT MACHINE.
IT HAS LESS DRAFT. IT MOWS FASTER.

DOES NEATER AND BETTER WORK.
Is handled easier, and is in every way superior to side draft machines. Manufactured by WILBELL, TEVENS & CO.,
Send for Illustrated Circular. Poughkeepsie, N. Y.

WARNER'S SULKY REVOLVING RAKE was illustrated in the Report of the Commissioner of Agriculture as "the best according to my idea of Horse-Rakes," and "superior to any other in use." Send for Descriptive Circular.

WILBELL, DAY & CO., Mansfield, Ohio,
Manufacturers of Cook's Evaporator and Victor Case Mill, and standard Agricultural Machinery.

New York State Agricultural Works.

Established 1830.

Manufacturers of Wheeler's Patent Railway Horse Powers and Threshers and Cleaners, Lever Powers of the most approved kinds. Clover Hullers, Feed Cutters, Wood Sawing Machines, Shingle and Hoisting Machines, Horse Pitch-forks. The Atlantic Cotton Gin and Condenser, (saw made without filing), etc., etc. Also dealers in the most approved Agricultural Implements. Our machines cannot be excelled if enabled by any in the market, and we guarantee them in all respects.

Address: **WHEELER, MELICK & CO., Albany, N. Y.**

PLANT SORGHUM.

Youngman's Patent Sorghum Evaporator and Refiner removes all of the disagreeable Sorghum Flavor.

IT IS THE ONLY PERFECT EVAPORATOR.

The proprietors of the above Evaporator call the attention of the public to the superior merits of this invention. They claim that it is the best machine for making sorghum syrup and sugar, maple sugar, beet sugar, and other similar products.

It has the following Excellencies, viz.:

Excellencies.—1. It is the cheapest Evaporator ever made, requiring no arch, brick work, or other expenses after it leaves the manufacturer's hand. Any person who can afford to buy a lumber wagon, can buy one of these Evaporators.

2. It will make better evaporating, and with less fuel, in a day, than any other Evaporator, with the same capacity of pan.

3. It will make better syrup from sorghum cane juice than any other Evaporator invented, removing, as it does, all of the well-known disagreeable sorghum flavor.

4. It is remarkably easy to manage, as by a well-regulated system of clamping the heat can be gradually and so reliably given under the pans, instantly. One man can work the Evaporator with ease.

5. It is portable and may be lifted into a wagon by two or three men, with little difficulty, and being so can be transported from farm to farm, or from field to field, with the greatest facility.

The foregoing are points of excellence which sorghum growers will appreciate, and in support of them we append the following high testimony.

Testimony.—"The great objection to the use of sorghum syrup has heretofore been its characteristic unpleasant flavor. But this flavor seemed to be entirely removed by your process, and the syrup assimilated in taste to the best sugar-house syrup."—*Letter from Hon. George Newton, Commissioner of Agriculture, dated May 3d, 1867.*

Youngman's Evaporator now stands without a successful rival. It has been approved by the most reliable authorities, and seems to be almost a national blessing. From the finishing pan the syrup flows in a continuous stream, perfectly purified and refined from all miscellaneous gummy, and objectionable substances, and equal to the best refined sugar. It is then the best possible stage for the granulation, being entirely freed from glucose. This Evaporator is very light and portable, as it can be easily lifted into a lumber wagon and conveyed from place to place. The capacity of the machine is from eight to ten gallons per hour, and the consumption of wood is no more than an old-fashioned box stove. *See Report of the United States Farm Implements in the Agricultural Report of the Patent Office for the year 1865.*

From the last pan, called 'the flusher,' the liquid comes out a most delicious syrup, pure as red-rose honey, and as free from the disagreeable vegetable taste as maple syrup. This machine has every excellent characteristic to recommend it. Every part is most efficient, and one man can make one barrel of syrup in one day with a small quantity of fuel. It is compact, will last almost a lifetime with proper care, and can be employed for making maple sugar, or maple syrup, or beet sugar, quite as satisfactorily as it can be used when making sorghum syrup. *See Agricultural Editor New York Times, Weekly Edition, Feb. 19, 1867.*

"The Committee appointed by the Farmers' Club to examine Youngman's Evaporator desire to report that they went to Baltimore and there surveyed and experimented with the above-named Evaporator; and it affords them satisfaction to report to the American Institute, that the operation of this new Evaporator exceeded their highest expectations."

"The Committee were also well pleased with its portability."

"The small quantity of fuel required to make fifty gallons of syrup is also an economical item."

"The great simplicity and durability of every part of this device constitute another point of pre-eminent importance in the estimation of the Committee."

See Report of the Committee of Farmers' Club of American Institute to meeting of Club at New York, October 1867.

"I planted about three-fourths of an acre of cane, which was manufactured by Youngman's Evaporator. The cane was only of medium quality. The product was 185 gallons of syrup; two loads of fodder, equal to the best timothy hay; and a full two-horse load of seed, which for cattle feed is the best quality. The quality of the best cane is equal to the best syrup of commerce. While the inferior is equal to the best making molasses."—*Rev. Joseph Stevens, Jersey Shore, Pa.*

Success.—Although Youngman's Evaporator has succeeded, it has already taken the first premium at six State Expositions and has taken the first premium over every other Evaporator wherever exhibited.

Premiums.—During the year 1868, the proprietors of the Evaporator procured, by inducing a wide-spread trial of its merits, will present to every purchaser the following three articles as a premium, viz.: A beautiful Silver-Plated Case-Basket, Silver-Plated Butter Cup, and Silver-Plated Butter-Dish. All of these articles are substantially made and of elegant design. They will be sent with the Evaporator secure and packed for shipment, and upon receipt of the price of the Evaporator. Where Evaporators are sent, price to be paid on delivery. These premiums will be sent as soon as the order is received, and informed that the Evaporators have been paid for.

Price.—The price of the Evaporator complete is \$200. It will be sent to any address on receipt of the order, draft on New York City to the order of the General Agents, or on Baltimore, Md., to the order of the manufacturers, is the best method of payment. Machines will also be sent to any address, price to be collected on delivery, on receipt of satisfactory assurances by the undersigned of the responsibility of the parties ordering.

Full and explicit directions sent with each Evaporator. *Syrup made on this Evaporator is worth from 10 to 15 cents to fifty cents per gallon more than that made on any other.*

For further information of Evaporators, address **JOHN D. & CO.,**

DARWIN'S NEW WORK.

THE VARIATION OF ANIMALS AND PLANTS

UNDER DOMESTICATION.

BY

CHARLES DARWIN, M.A., F.R.S., &c.

WITH A PREFACE

TO THE

AMERICAN EDITION

BY THE AUTHOR,

AND ALSO ONE BY

PROFESSOR ASA GRAY.

IN TWO VOLUMES.

This work treats of the variations in our domestic animals and cultivated plants, discussing the circumstances that influence these variations, inheritance of peculiarities, results of in-and-in breeding, crossing, etc.

It is one of the most remarkable books of the present day, presenting an array of facts that show the most extraordinary amount of observation and research. All the domestic animals, from horses and cattle to canary-birds and honey-bees, are discussed, as well as our household culinary and other plants, making it a work of the greatest interest.

Its importance to agriculturists, breeders, scientific men, and the general reader, will be seen by its scope as indicated in the following partial enumeration of its contents: PIGS, CATTLE, SHEEP, GOATS; DOGS AND CATS, HORSES AND ASSES; DOMESTIC RABBITS; DOMESTIC PIGEONS; FOWLS, DUCKS, GESE, PEACOCK, TURKEY, GUINEA FOWL, CANARY-BIRD, GOLD-FISH; HIVE-BEES; SILK-MOTHS. CULTIVATED PLANTS; CEREAL AND CULINARY PLANTS; FRUITS, ORNAMENTAL TREES, FLOWERS, BUD VARIATION. INHERITANCE, REVERSION OR ATAVISM, CROSSING. ON THE GOOD EFFECTS OF CROSSING, AND ON THE EVIL EFFECTS OF CLOSE INTERBREEDING. SELECTION. CAUSES OF VARIABILITY, LAWS OF VARIATION, ETC., ETC.

Published in two Volumes of nearly
1100 pages.

FINELY ILLUSTRATED.

SENT POST-PAID.....PRICE \$6.00.

NEW AND BEAUTIFUL WORK.

THE BOOK OF EVERGREENS.

BY

JOSIAH HOOPES, WESTCHESTER, PA.

Including Propagation, Cultivation,
Description of Varieties and their
Adaptability to Different Situations.

This is a long needed work, as in the present state of our knowledge upon the cone-bearing plants, or Conifere, of the botanist, is posted up. Mr. Hoopes is one of those persons rarely met with—a practical cultivator, and a man of science at the same time. While his work gives us all the Conifere arranged in the classification of the botanist, it at the same time treats of the experience, not only of the author, but of American cultivators generally, with this large and important family of plants.

Evergreens play so interesting a part, not only in ornamental planting, but in what may be termed economical planting, (i. e. hedges, screens, wind-breaks, etc.), that we are sure a work which treats of their propagation and culture, describes in both popular and scientific language the many species, and what is of not the least importance, gives a list of the tender and unreliable ones, will be warmly welcomed by every lover of these beautiful trees.

Mr. Hoopes brings to his work a perfect enthusiasm for his subject, and is as free to condemn a plant as if he were not a nurseryman. All the latest novelties from Japan, the North-west, etc., are noticed, and their success or failure, both in this country and in England, is recorded.

The work is abundantly illustrated with most carefully executed engravings, for the greater part from living specimens.

We must commend the conscientious care the author has shown in striving to arrive at the proper names; and doubtless much of confusion that at present exists in respect to names among both dealers and growers, will be corrected now that they have a standard work to refer to.

Not the least interesting portion of the book is an account of the principal collections of evergreens in the country.

The work is now ready. 435 pp., 12mo, on fine paper.
SENT POST-PAID, PRICE \$3.00.

ORANGE JUDD & CO.,
245 Broadway, New York City.

A NEW BOOK. THE GRAPE VINE.

By FREDERICK MOHR,
DOCTOR OF PHILOSOPHY AND MEDICINE.

Translated from the German, and accompanied with
Hints on the Propagation and General Treat-
ment of American Varieties.

By HORTICOLA.

This work is mainly devoted to the most elementary matters. It explains the structure and mode of growth of the vine so clearly that no intelligent person who reads it need be in doubt what to do with his vines. It has been well translated, and a chapter on the propagation of American varieties has been substituted for the original one on multiplying the European grape. As anatomy is the foundation of surgery, so is a knowledge of the structure of the vine to the vine dresser. In both cases it is as important to know when and where to cut, and how.

CONTENTS.

Development and Structure of the Grape Vine.
The Node; The Branch; Reasons for Pruning; Pruning.
Training on Trellises; Treatment in Summer; Plantations.
Vines Trained along the Garden Walk.
Trellises on Walls; Tree Trellises.
Vines Trained to Trellises; Bruner's Method.
Time Required for Covering a Trellis.
Maturing the Vine; Age of Vineyard.
The Rising Sap in the Vine; The Grape Disease.
Treatment of Vines Injured by Frost.
Implements; Proper Time to Perform Work on the Vine.
Constituents of the Vine and their Distribution.
Propagation of the Vine: By Layers; By Cuttings; By Grafting; By Inarching; By Seeds.
Hybridization.

American Varieties—General Management; Planting; Pruning; Pinching; Covering in Fall.

SENT POST-PAID. PRICE, \$1.00.

ORANGE JUDD & Co.,

A NEW WORK.¹ SMALL FRUIT CULTURIST.

By ANDREW S. FULLER,

PRACTICAL HORTICULTURIST, RIDGEWOOD, BROOKLYN CO., N. Y.

A new work, and the only one devoted to Small Fruits. Special treatises of this kind have the advantage that the author can more thoroughly discuss his subject, and go into greater detail, than in a work embracing both large and small fruits. The work covers the whole ground of Propagation, Culture, Varieties, Packing for Market, etc.

CONTENTS: INTRODUCTION.—I. RASPBERRY.—II. STRAWBERRY.—III. RASPBERRY.—IV. BLACKBERRY.—V. DWARF CHERRY.—VI. CURRANT.—VII. GOOSEBERRY.—VIII. CORNELIAN CHERRY.—IX. CRANBERRY.—X. HUCKLEBERRY.—XI. SHEPHERDIA.—XII. PREPARATION FOR GATHERING FRUIT.

We predict that this work will bring Mr. Fuller many enemies, as he has given his opinion about varieties without reserve. On the other hand it will the more strongly endear him to all true lovers of horticulture, as these wish to have the merits of fruit given without reference to the persons who introduce them.

While very full on all the small fruits, the Currants and Raspberries have been more carefully elaborated than ever before, and in this important part of his book, the author has had the invaluable counsel of Charles Downing. The chapter on gathering and packing fruit is a valuable one, and in it are figured all the baskets and boxes now in common use. The book is very finely and thoroughly illustrated, and makes an admirable companion to his Grape Culturist.

DRAINING FOR PROFIT

AND

DRAINING FOR HEALTH.

By GEO. E. WARING, Jr.,

ENGINEER OF THE DRAINAGE OF CENTRAL PARK, NEW YORK.

Illustrated.

TABLE OF CONTENTS:

LAND TO BE DRAINED AND THE

REASONS WHY.—Indications of the need of draining.—Sources of water.—Objections to too much water.—Wet sub-soil.

HOW DRAINS ACT AND HOW

THEY AFFECT THE SOIL.—Characteristics of well laid tile drain.—Surface-water and rain water beneficial, springs and soakage water injurious.—Cracking of stiff clays.—Evaporation and filtration.—Rain fall.—Evaporation.—Temperature.—Drought.—Porosity or mellowness.—Chemical action in the soil.

HOW TO GO TO WORK TO LAY

OUT A SYSTEM OF DRAINS.—Amateur draining.—Maps.—Levelling Instruments.—Outlets and location of drains.—Main drains.—Spring water.—Fall.—Ties.—Depth and distance apart.—Direction of laterals.—Collars.—Discharge of water from drains.

HOW TO MAKE THE DRAINS.—

Tools.—Marking the lines.—Water courses.—Outlet.—Silt Basins.—Opening the ditches.—Grading.—Tie laying.—Connections.—Covering the tile and filling in.—Collecting the water of springs.—Amending the map.

HOW TO TAKE CARE OF DRAINS

AND DRAINED LAND.—Removing obstructions.—Mistake of substituting large tiles for small ones which have become obstructed.—Heavy lands should not be trampled while wet.

WHAT DRAINING COSTS.

Drainage, expensive work.—Their permanence and lasting effects.—Cheapness versus economy.—Details of cost.—(1. Engineering and Superintendence.—2. Digging the ditches.—3. Grading the bottoms.—4. Tile and tie laying.—5. Covering and filling.—6. Outlets and Silt Basins.)

WILL IT PAY?

Increased crops required to pay cost of draining.—(Corn, Wheat, Rye, Oats, Potatoes, Barley, Hay, Cotton, Tobacco).—Instances of profit.—Benefit of draining in facilitating farm work.

HOW TO MAKE DRAINING TILES.

Materials.—Preparation of earths.—Moulding tile machines.—Drying and rolling.—Burning.—Kilns.—General arrangement of a tiler.

THE RECLAIMING OF SALT

MAISHES.—Extent of marshes on the Atlantic Coast.—The English Fens.—Harlem Lake.—The exclusion of sea water.—Removal of the causes of inundation from the upland.—Removal of rain fall and water of filtration.—Embankments.—Musk rats.—Rivers and Creeks.—Outlet of drainage.

MALARIAL DISEASES.

Fever and Ague.—Neuralgia.—Viciety of New York.—Dr. Bartlett on Periodical Fever.—Dr. Metcalf's Report to U. S. Sanitary Commission.—La Roche on the effects of Malarial Fever.—Dr. Salisbury on the "Cause of Malarial Fevers."—English experience.—Reports to the British Parliament.—Causes of Malaria removed by draining.

HOUSE AND TOWN DRAINAGE.

Sewerage.—The use of pipes.—The new outlet sewers in London.—The use of steam pumps to secure outlets.—Utilization of sewage matters in agriculture.—Effects of imperfect house drainage on health.—Typhoid fever.—The Westminster fever in London.—Epidemic at the Applewood Young Ladies Institute in Pittsfield, Mass.—Lambeth Square, London.—Back drainage.—Water supply.—General Board of Health, (England).

SENT POST-PAID.

PRICE, \$1.50.

Just Published**A NEW WORK ON APPLES.****AMERICAN POMOLOGY.****APPLES.**

By DOCT. JOHN A. WARDER,

PRESIDENT OHIO POMOLOGICAL SOCIETY; VICE-PRESIDENT
AMERICAN POMOLOGICAL SOCIETY, ETC.**293 Illustrations.**

To pomologists a work by Dr. Warder will need no commendation. Though a citizen of Ohio, he is so sure to be at any pomological gathering, be it East or West, that the whole country claims him, and if any one has a right to entitle his work *American Pomology* it is certainly Dr. Warder. The present is the first instalment of a work intended to cover the whole ground. In it the author has attempted the difficult task of bringing apples into something like order.

This volume has about 750 pages, the first 375 of which are devoted to the discussion of the general subjects of propagation, nursery culture, selection and planting, cultivation of orchards, care of fruit, insects, and the like; the remainder is occupied with descriptions of apples. With the richness of material at hand, the trouble was to decide what to leave out. It will be found that while the old and standard varieties are not neglected, the new and promising sorts, especially those of the South and West, have prominence. A list of selections for different localities by eminent orchardists is a valuable portion of the volume, while the Analytical Index or *Catalogue Raisonné*, as the French would say, is the most extended American fruit list ever published, and gives evidence of a fearful amount of labor.

This differs from any fruit book heretofore published in this country, in its complete classification of apples. The author gives the principal European systems and modestly puts forth his own to be tested by practice. He divides apples into four classes, according to their forms. Each of these classes is sub-divided by other obvious characters, and it would seem that any apple described in the book might be easily identified. We trust that this will prove a great help to the pomologist.

Fruit-growers will welcome this book as a valuable and long-wished for addition to pomological literature, and it will be found equally useful to the novice and the experienced orchardist. The work has 293 illustrations, is printed on good paper and well bound.

SENT POST-PAID, PRICE \$3.00.

ORANGE JUDD & CO.,
245 Broadway and 41 Park Row, N. Y.**A NEW WORK.
GARDENING FOR PROFIT,**

IN THE MARKET AND FAMILY GARDEN.

BY PETER HENDERSON.

Illustrated.

This is the first work on Market Gardening ever published in this country. Its author is well known as a market gardener of eighteen years' successful experience. In this work he has recorded this experience, and given without reservation the methods necessary to the profitable culture of the commercial or

MARKET GARDEN.

It is a work for which there has long been a demand, and one which will commend itself, not only to those who grow vegetables for sale, but to the cultivator of the

FAMILY GARDEN

To whom it presents methods quite different from the old ones generally practiced. It is an

ORIGINAL AND PURELY AMERICAN

work, and not made up, as books on gardening too often are, by quotations from foreign authors.

Everything is made perfectly plain, and the subject treated in all its details, from the selection of the soil to preparing the products for market. Frames, Hot-beds, and Forcing Houses, the management of which is usually so troublesome to the novice, are fully described, and the conditions of success and causes of failure clearly stated.

The success of the market gardeners near New York City is proverbial, and this is the only work that sets forth the means by which this success has been attained. Valuable hints are given to those who would raise Vegetables at the South for northern markets.

The following synopsis of its contents will show the scope of the work:

Men Fitted for the Business of Gardening.
The Amount of Capital Required and Working Force per Acre.
Profits of Market Gardening.
Location, Situation, and Laying Out.
Soils, Drainage, and Preparation.
Manures. Implements.
Uses and Management of Cold Frames.
Formation and Management of Hot-beds
Forcing Pits or Green-houses.
Seeds and Seed Raising.
How, When, and Where to Sow Seeds.
Transplanting. Insects.
Packing of Vegetables for Shipping.
Preservation of Vegetables in Winter.
Vegetables, their Varieties and Cultivation.

INTRODUCTORY.—BOTANICAL CHARACTER OF THE Vine, Propagation by Seed,—4 Illustrations.

GROWING FROM SEED.—GATHER WHEN FULLY RIPE.

PROPAGATION BY SINGLE BUDS.—MODE OF OPERATION, Planting in Beds, Single Buds in Open Air, Starters in Hot Beds, Form of Single Bud Cutting—5 Illustrations.

CUTTINGS OF UNKIPED WOOD.—THOUSANDS OF VINES are Annually Produced from Green Cuttings—4 Illustrations.

PROPAGATING HOUSE.—PERFECTION SHOULD BE our Aim, Span Roofed Propagating House, Lean-to Propagating House, Single Rooted House, Flues—3 Ill.

CUTTINGS IN OPEN AIR.—TIME TO MAKE CUTTINGS, Selection of Cuttings, Form of Cuttings, Mallet Cuttings.

LAYERING THE VINE.—THIS IS ONE OF THE MOST Certain and Convenient Methods in Use—1 Illustration.

GRAFTING THE GRAPE.—THIS IS AN OLD BUT VERY Uncertain Mode of Propagating the Grape, but Can be Used Successfully—4 Illustrations.

HYBRIDIZING AND CROSSING.—THESE ARE OPERATIONS that Should Demand the Attention of Every One Who Undertakes to Produce New Varieties, Mode of Operation—3 Illustrations.

TRANSPLANTING.—VINES WILL OFTEN REQUIRE ONE Season of Nursery Culture before being Planted in the Vineyard, Heeling-in—3 Illustrations.

SOIL AND SITUATION.—MUCH DEPENDS UPON THEM, Preparing the Soil, Manures and their Operations.

STEM APPENDAGES.—SPINES, HAIRS, LATERALS, Forms of Leaves, Tendrils, Buds—7 Illustrations.

PLANTING THE VINE.—A GREAT DIVERSITY OF Opinion, My Own Rule, Root Pruning, How to Plant.

GRAPE TRELLISES.—2 Illustrations.

TIME TO PRUNE VINES.—PRUNING AND TRAINING, Opposite Arms, Oblique Arms, A Plan for Poor Soils.

GARDEN CULTURE.—POSITION OF BORDER, TRAINING the Vines, Four Tiers of Arms, Double Stem, Trellise in Gardens, Training to Stakes, Girdling the Vine, Removing the Leaves—9 Illustrations.

GATHERING THE FRUIT.—PRESERVING THE FRUIT, Wine Making, Pruning Shears—1 Illustration.

INSECTS.—ROSE CHAFER, GRAPE VINE FLEA BEETLE, Spotted Pelidnota, Tree Beetle, Caterpillars, Yellow Bear, Hog Caterpillar, Grape Vine Sphinx, Blue Caterpillar, Frocks Americana, Leaf Rollers, Thrips, Aphids, Red Spider, Vine Scale, Diseases, Mildew, Sun Scald—13 Illus.

DESCRIPTION OF (nearly Seventy) VARIETIES.

REVIEW OF VARIOUS SYSTEMS OF PRUNING AND Training, Reversing the Arms, Single Arm System, Bow System, Long Rod Spur System, Upright Cane, Thumery System.—Index.

SENT POST-PAID, PRICE \$1.50.

COTTON CULTURE.

BY JOSEPH B. LYMAN.

WITH AN ADDITIONAL CHAPTER ON

COTTON SEED AND ITS USES.

BY J. R. SYPPER.

CONTENTS.

PART I.

THE COTTON FARM.—ITS STOCK, IMPLEMENTS, AND LABORERS.

PREPARATION OF SOIL AND PLANTING.

HOW THE CROP IS TO BE CULTIVATED.

COTTON PICKING.

GINNING, BALING, AND MARKETING.

THE COTTON PLANTER'S CALENDAR.

PART II.

QUALITY, EXTENT, AND CHARACTER OF COTTON LANDS OF NORTH AMERICA.

ENEMIES AND DISEASES OF COTTON.

IMPROVED AND SCIENTIFIC CULTURE.

VARIOUS KINDS OF COTTON CULTIVATED IN THE UNITED STATES.

HOW TO REALIZE THE MOST FROM A CROP; THE UNION OF THE GROWING OF COTTON WITH ITS MANUFACTURE INTO YARNS AND FABRICS.

VALUE OF COTTON AS A PLANT, AND THE USES TO WHICH IT MAY BE APPLIED.

THE PAST AND THE FUTURE OF COTTON; ITS HISTORY AND STATISTICS.

PRACTICAL SUGGESTIONS TO VARIOUS CLASSES OF PERSONS WHO PROPOSE TO ENGAGE IN COTTON GROWING.

COTTON SEED OIL. COTTON SEED CAKE.

SENT POST-PAID.

PRICE \$1.50.

ORANGE JUDD & CO.,
245 Broadway, New York.THE AMERICAN
HORTICULTURAL ANNUAL

For 1868.

A YEAR-BOOK

FOR EVERY HOME.

The second number of this serial is now ready. It will contain a popular record of horticultural progress during the past year, and contains valuable articles from

EMINENT HORTICULTURISTS.

Among those who contributed to its pages are

HON. MARSHALL P. WILDER,

PETER HENDERSON,

THOMAS MEEHAN,

JOSIAH HOOPES,

WM. S. CARPENTER,

GEORGE W. CAMPBELL,

DOCTOR VAN KEUREN,

DOCTOR JOHN A. WARDER,

S. B. PARSONS,

JAS. J. H. GREGORY,

GEORGE SUCH,

ANDREW S. FULLER,

JOHN SAUL,

JAMES VICK, and

other well known pomological and floricultural writers.

The engravings, which have been prepared expressly for the work, are numerous, and make it the

MOST BEAUTIFULLY ILLUSTRATED

work of its kind ever published in this or any other country. It contains Tables, Lists of Nurserymen, Seedsmen, and Florists, and other useful matters of reference. Sent post-paid. Price, fancy paper covers, 50 cts.; cloth, 75 cts.

ORANGE JUDD & CO.,
245 Broadway, New York.

COPELAND'S COUNTRY LIFE.

A COMPENDIUM OF
AGRICULTURAL & HORTICULTURAL
Practical Knowledge.

By ROBERT MORRIS COPELAND.

It contains 936 large Octavo Pages and 350 Engravings, and embraces Descriptions, Hints, Suggestions and Details of great value to those interested in Country Life. The following are some of the matters of which it treats:

**DRAINING.
CATTLE.
SHEEP.
SHRUBS.
FRUITS.
FLOWERS.
VEGETABLES.
HOT-HOUSE PLANTS.
GRAPE CULTURE.
ORNAMENTAL TREES.**

The **Kitchen Garden** receives particular attention. In short, as its name indicates, the book treats of almost every subject that needs consideration by those living in the country, or having anything to do with the cultivation of the soil.

SENT POST-PAID. - - - PRICE, \$5.00.

ORANGE JUDD & CO.,
245 Broadway, New-York.THE AMERICAN
AGRICULTURAL ANNUAL

For 1868.

A YEAR-BOOK

WANTED BY EVERYBODY.

This volume is now ready, and contains much of interest to every agriculturist. Besides the general record of agricultural progress, it will contain a valuable article on

Factory Dairy Practice,

By GARDNER B. WEEKS, Esq., Secretary of the American Dairymen's Association, in which he discusses the reasons for the best practice and the most approved apparatus, buildings, etc., fully illustrated, and is equally interesting to the practical dairyman and to the novice,

Sewers and Earth Closets

In their relations to Agriculture, by COL. GEO. E. WABING.

Winter Wheat,

Describing, with engravings, new and valuable varieties, by JOSEPH HARRIS and JOHN JOHNSTON;—one upon

Scythes and Cradles,

By JOHN W. DOUGLAS, (fully illustrated;) also articles on **Horse Breaking** and on **Biting Colts**, by SAM'L F. HEADLY, Esq., (illustrated;) on **Recent Progress in Agricultural Science**, by Prof. S. W. JOHNSON; on Commercial Fertilizers, Veterinary Medicine and Jurisprudence, Progress of Invention Affecting Agriculture. Valuable Tables for Farmers and others, etc.

It is intended that the work shall be practical, excellent in the beauty of its illustrations, and in its adaptation to the wants of American Farmers, superior to anything of the kind heretofore published.

In its general features it will be like the Agricultural Annual for 1867, containing an Almanac and Calendar, and there will be added a list of dealers in Agricultural Implements, Seeds, etc. Sent post-paid. Price, fancy paper covers, 50 cts.; cloth, 75 cts.

ORANGE JUDD & CO.,
245 Broadway, New York.

HINTS TO HORSEKEEPERS.

By THE LATE HENRY WILLIAM HERBERT.

(FRANK FORESTER.)

BEAUTIFULLY ILLUSTRATED.

CONTENTS.

**How to Breed a Horse.
Ponies—Different Breeds.
How to Breed Mules.
How to Buy a Horse.
How to Feed a Horse.
How to Groom a Horse.
How to Break a Horse.
How to Physic a Horse.
How to Shoe a Horse.
How to Ride a Horse, etc.**

SENT POST-PAID. - - - PRICE, \$1.75.

ORANGE JUDD & CO.,

(Advertisements on this page, \$2.50 per Agate Line of Space.)

ESTABLISHED 1861.

THE GREAT AMERICAN TEA COMPANY

HAVE RECEIVED TWO FULL CARGOES OF THE FINEST NEW CROP TEAS.

22,000 HALF CHESTS by ship *Golden State*.
12,000 HALF CHESTS by ship *George Shattou*.

In addition to these large cargoes of Black and Japan Teas, the Company are constantly receiving large invoices of the finest quality of Green Teas from the Moyne district of China, which are unrivaled for fineness and delicacy of flavor.

To give our readers an idea of the profits which have been made in the Tea trade, we will start with the American houses, leaving out of the account entirely the profits of the Chinese factors.

1st. The American house in China or Japan makes large profits on their sales or shipments—and some of the richest retired merchants in the country have made their immense fortunes through their houses in China.

2d. The Banker makes large profits upon the foreign exchange used in the purchase of Teas.

3d. The Importer makes a profit of 50 to 50 per cent. in many cases.

4th. On its arrival here it is sold by the cargo, and the Purchaser sells it to the Speculator in invoices of 1000 to 2000 packages, at an average profit of about 10 per cent.

5th. The Speculator sells it to the Wholesale Tea Dealer in lots at a profit of 10 to 15 per cent.

6th. The Wholesale Tea Dealer sells it to the Wholesale Grocer in lots to suit his trade, at a profit of about 10 per cent.

7th. The Wholesale Grocer sells it to the Retail Dealer at a profit of 15 to 25 per cent.

8th. The Retailer sells it to the Consumer for ALL THE PROFIT HE CAN GET.

When you have added to these eight profits as many brokerages, cartages, storages, cooperages and wastes, and add the original cost of the Tea, it will be perceived what the consumer has to pay. And now we propose to show why we can sell so very much lower than other dealers.

We propose to do away with all these various profits and brokerages, cartages, storages, cooperages and wastes, with the exception of a small commission paid for purchasing to our correspondents in China and Japan, one cartage, and a small profit to ourselves—which, on our large sales, will amply pay us.

By our system of supplying Clubs throughout the country, consumers in all parts of the United States can receive their Teas at the same price (with the small additional expense of transportation), as though they bought them at our warehouses in this city.

For manner of getting up Clubs, see former advertisement in this paper.

Parties sending Club or other orders for less than thirty dollars had better send Post-office Drafts or money with their orders, to save the expense of collections by express; but larger orders we will forward by express, to collect on delivery.

Hereafter we will send a complimentary package to the party getting up the Club. Our profits are small, but we will be as liberal as we can afford. We send no complimentary package for Clubs less than \$3.

Parties getting their Teas of us may confidently rely upon getting them pure and fresh, as they come direct from the Custom House stores to our Warehouses.

We warrant all the goods we sell to give entire satisfaction. If they are not satisfactory, they can be returned at our expense within 30 days, and have the money refunded.

The Company have selected the following kinds from their stock, which they recommend to meet the wants of clubs. They are sold at cargo prices, the same as the Company sell them in New York, as the list of prices will show.

PRICE LIST OF TEAS:

OOLONG (Black), 70c., 80c., 90c., best \$1 75.
MIXED (Green and Black), 7c., 80c., 90c., best \$1 per lb.
ENGLISH BREAKFAST (Black), 80c., 90c., \$1, \$1.10, best \$1.20 per pound.

IMPERIAL (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.
YOUNG HYSON (Green), 80c., 90c., \$1, \$1.10, best \$1.25 per pound.

UNCOLORED JAPAN, 90c., \$1, \$1.10, best \$1.25 per pound.
GUNPOWDER (Green), \$1.25, best \$1.50 per pound.

Consumers can save from 50c. to \$1 per pound by purchasing their Teas of this Company.

COFFEES ROASTED AND GROUND DAILY.

GROUND COFFEE, 20c., 25c., 30c., 35c., best 40c. per pound.
Hotels, Saloons, boarding-house keepers, and Families who use large quantities of Coffee, can economize in that article by using our FRENCH BREAKFAST AND DINNERS COFFEE, which we sell at the low price of 30c. per pound, and warrant to give perfect satisfaction.

ROASTED (Unground) 30c., 35c., best 40c. per lb.
GREEN (Unroasted) 25c., 30c., 35c., best 35c. per lb.

N. B.—All villages and towns where a large number reside, by Clubbing together, can reduce the cost of their Teas and Coffees about one-third (beside the Express charges), by sending directly to "The Great American Tea Company."

BEWARE of all concerns that advertise themselves as branches of our Establishment, or copy our name either wholly or in part, as they are *hoaxes* or *imitations*. We have no branches, and do not, in any case, authorize the use of our name.

Post-Office orders and Drafts, payable to the order of "The Great American Tea Company," direct letters and orders to the (as below, no more, no less)

Great American Tea Company,

Nos. 31 and 33 VESEY-ST.,

Post-Office Box, 5643, New York City.

Accumulated Assets, \$9,159,759 91

Divisible Surplus January 1st, 1868, \$1,642,425 59

Cash Dividends, Payable Annually.

THE NEW YORK LIFE INSURANCE CO.

IS ONE OF THE

OLDEST INSTITUTIONS

Of the kind in America, having been chartered in the year 1841, and commenced business in May, 1845.

During the twenty-three years of its existence, it has issued policies upon the lives of more than

FIFTY THOUSAND PERSONS,

And has paid in losses \$5,000,000 to the families and representatives of those who have deceased while members of the Company.

Special care in the selection of its risks, strict economy, and a safe and judicious investment of its funds, emphatically characterize the management of this Company.

Policies are issued in all the favorable forms which experience has indicated as favorable to the assured, and can be made payable at a specified time during the lifetime of the assured or at death. Premiums may be paid annually, semi-annually or quarterly.

The Progress of the Company for the Past Four Years Will be seen in the following statement:

	Assets.	Increase of Assets over previous year.
1864.....	\$3,658,755.55.....	\$1,005,317.63
1865.....	4,841,003.70.....	1,182,248.15
1866.....	6,727,816.65.....	1,886,812.95
1867.....	8,774,326.01.....	2,046,509.36
Total Increase.....		\$6,120,784.09

This increase of over Six Million Dollars in the Assets during the past four years has been attained, notwithstanding that nearly Two Million Dollars for Losses, and over One Million Dollars for Dividends have been actually paid out during that period.

MORRIS FRANKLIN, President.
ISAAC C. KENDALL, Vice-President.
WILLIAM H. BEERS, Actuary.

THEODORE M. BANTA, Cashier.
CONNELL'S R. BOGERT, M. D., Medical
GEORGE WILKES, M. D., Examiners.
CHARLES WRIGHT, M. D., Asst. Med. Examiner.

22 Policies issued in the year 1867 will receive their dividends on the payment of the second Annual Premiums. Existing Policies entitled to the Dividend declared in 1867, will receive two Dividends during this year.

THOMAS R. AGNEW,

260 & 262 Greenwich-st., New York.
Has reduced the prices of TEAS, COFFEES, SUGAR, FLOUR, and all kinds of GROCERIES.

From 10 to 25 per cent.
BEST JAPAN TEA, \$1.00.
1st-1st ENGLISH BREAKFAST TEA, \$1.00.
SPECIAL COFFEES, 75c., 80c., 90c., 100c.
COFFEES, ROASTED & GROUND, 15 Cents to 40 Cents, (Best in Market).
1000 Barrels FLOUR, all grades, FROM \$1.00 UPWARDS.
SUGARS, all grades, at REFINERS' PRICES; every thing used in every Family cheaper than any other Store in New York.

THOMAS R. AGNEW occupies his own store, owns the property, and has no rent to pay. Imports and buys exclusively for cash, never gave a note in his life, consequently can undersell any house in the city.

RURAL IMPROVEMENTS.

Robert Morris Copeland, author of Country Life, furnishes plans and advice for laying out Public and Private grounds of every description. Letters to John H. Phelps, Nathaniel Thayer, Boston, F. C. Shaw, New York, O. S. Hubbard, Philadelphia, G. T. Fletcher, Indianapolis, Ind.

Office 40 Barristers' Hall, Boston, Mass.

DELAWARE—DELAWARE.

Money made in growing fruits and vegetables. For descriptive Pamphlet on the subject, send 50c. to
HENRY T. WILLIAMS,
Office of The Independent, N. Y. City.

"SEELEY'S HARD RUBBER TRUSS" Cures Rheumatism, the most difficult safely and easily never lasts, breaks, moves or soils; always new. Sold by all Druggists. Send for pamphlet, 1347 Chestnut street, Philadelphia, Pa.

EVERY FARMER SHOULD HAVE

FAIRBANKS'S THE STANDARD.

These Scales have been manufactured by the Original Inventors for nearly 40 years, and are regarded throughout the country as the Standard; they were referred to as such by the Judges at the GREAT PARIS EXPOSITION, WHO AWARDED TO THEM THE

Nearly two hundred different modifications are made, adapted to every branch of business. Among which are:

HAY, COAL AND CATTLE SCALES.

Capacity, Two, Three, Four, Five, Six & Ten Tons.

For weighing loaded wagons, carts, live stock, produce, &c.

These Scales may be placed in the barn floor, in the yard or by the roadside, where they can be made available for an entire neighborhood.

PORTABLE PLATFORM SCALES,

WITH AND WITHOUT WHEELS.

No.	Platform, 21 by 50 inches...	Capacity, 2000 pounds.
No. 1.....	do, 21 by 31 do,	do, 1000 do,
No. 2.....	do, 21 by 39 do,	do, 1400 do,
No. 3.....	do, 20 by 38 do,	do, 1200 do,
No. 4.....	do, 17 by 39 do,	do, 900 do,

NEW YORK, JUNE, 1868.

NEW SERIES—No. 257.

[COPYRIGHT, SECURED.]

THE CAT-BIRD.—(*Galeoscoptes Carolinensis*).—Drawn and Engraved for the American Agriculturist.

The Cat-bird receives its common name from its call note, which closely resembles the mewing of a cat, and is used by both sexes. This is not a particularly agreeable sound, yet indicating, as it does, the fact that these beautiful birds are entirely at home in the thickets or shrubbery whence it proceeds, we like it. The cat-bird

seeks rather than shuns the abodes of men. Its food is chiefly seeds, berries, and insects, and though it takes some of the fruit, its presence in our gardens and orchards is productive of great good. The song of the male is a soft, sweet melody, not unlike the songs of the brown thrush and mocking-bird. It is a good mimic, also, and

caged it becomes quite proficient in this way, and may be taught to repeat a whistled strain much as the mocking-bird will do. The alarm note is an angry chatter. The nest is built in shrubs, and four or five bright green eggs are laid. These birds continue in our latitude from April to about the first of November.

Contents for June, 1868.

Barley—Harvesting	219
Beans—More About	217

AMERICAN AGRICULTURIST.

NEW-YORK, JUNE, 1868.

A late, wet season makes June a hard month for the farmer. Under the most favorable circumstances no month of the year puts his executive abilities more thoroughly to the test. Without well-matured plans, and a knowledge of about how much the labor, both of men and animals, will accomplish, the best farmer will be likely to fall behindhand. The weeds grow so fast in moist, warm weather that the fields must be hoed almost as soon as planted, and the growth of the grass in the meadow is so rapid, that the necessity for laying down the hoe for the scythe is often a most trying one. It is very rare, in our latitude, that June is not, on the whole, a prosperous time for the crops. Very dry Junes are of rare occurrence, and a drought at this season is productive of great injury—quite as much so as a sharp frost. Farmers whose spring work has been delayed by the wetness of the ground have in this way the value of thorough draining impressed upon them. Much drained land was this year fit for plowing and planting early in April, while that of precisely the same character, not drained, yet not what would be called wet land, will not be fit to plow before the first of June, even if the weather be dry the latter part of May.

Hints about Work.

Buildings.—There are certain things which can be better done at this season than at any other. The barns are nearly empty. They must be prepared for the new crops of hay and grain. If a barn should need shingling, this ought to be done when it is empty, so that the nails which fall may be cleaned up. We know a case of a cow which died from swallowing nails in the hay. These were found in a large mass in the animal's stomach. Hay lofts and bays should be cleaned, and all the hay seds and rubbish removed before any hay is placed in them. Old hay is good, but it is best not to allow it to accumulate from year to year.

Working Animals must be well fed if one expects them to work well. Oxen worked all day and turned into the pasture for the night without grain of any kind, cannot be expected to do much work. Give horses thorough daily grooming. A gill of oil-meal, mixed with the feed at each meal, will give a glossy coat, and is an excellent ingredient in any mixed feed given to them, or other animals.

Cows are now at pasture, and the fresh grass adds greatly to the flow of milk and to its richness and color; but this should not lead us to withhold all grain. A small quantity of oil-meal or corn-meal, or the two mixed, say one quart divided between the morning and evening, should be given.

Manure.—If cows are yarded or stabled, a very large quantity of manure is saved. We are two apt to look upon the manure crop as the harvest of the winter. With reasonable forethought and diligence the manure heaps will grow quite as fast in summer. We have one great advantage—fermentation takes place much more rapidly; hence accumulations of vegetable matter, fresh, or in form of muck and peat, if composted with stable manure, ashes, or lime, very rapidly ferment, and ripen into homogeneity, ready for use in the autumn.

Swine are widely employed as the summer manure makers, and they are worth so much more as rooters than "famed," that it is not worth while to "ring" or "tame" them, until they are penned to fatten. Confine them where they may have conveniently, sods, weeds, and all sorts of green rubbish throw to them to work over. If upon the manure of other stock, encourage diligence by scattering occasionally handfuls of corn about the heap. If muck or sods are used in the compost, swine will often tread it so hard as to arrest fermentation.

Sheep.—A few days after the ewes have been sheared all the ticks and most of the lice will prefer lamb to mutton, and be found upon the lambs. This is therefore just the right time to

dip the entire flock. We have great faith in the carbolic and cresylic soap dips for sheep, and when this article can be obtained, (and we must refer inquirers to our advertising pages), there is no need of having anything to do with either vegetable or mineral poisons, such as tobacco, arsenic, or mercury in any form. If sores, from too close shearing or sun scalds, occur, smear the wounds with an ointment of tallow and pine-tar

Butter.—If the butter is considered the best made during the year. Good butter makers pack it to keep the whole year. There is no difficulty about it if the buttermilk be thoroughly worked out, the butter salted one ounce to the pound, and worked again after standing 12 to 24 hours. It is packed in layers in firkins, with a thin layer of salt on the bottom, and salt between each layer. The butter must be packed air-tight, if possible—that is, without holes—and pounded down flat and solid. The less butter is handled, the better, and the lower the temperature at which it is worked, provided it be soft enough to work thoroughly, the more waxy and firm will it be. If the tub cannot be filled at once, cover the butter with a strong brine.

Cheese.—The production of the best cheese is inconsistent with butter making from the same milk. It requires but a little more care, cleanliness, and painstaking, with good judgment, to make cheese bring readily a high price, than to make that which is a drug on the market. See article on cheese making in the Am. Agricultural Annual for 1868.

Green Fodder Crops.—Sow corn in drills, 24 to 30 inches apart, for a succession of green fodder. This will keep up the flow of milk, and add greatly to the butter and cheese returns of the summer, especially if the pastures are a little overstocked, or the season is dry. Millet may be sown any time this month, for seed as well as for green fodder. Hungarian grass, a variety of millet, sown for hay, on land in fair condition only, will ordinarily yield a crop of two tons of good hay per acre.

Pastures may be benefited by top-dressings at any time, especially if close cropped. They respond at once if wash from the highways be turned upon them. Never overstock, but provide early green-fodder crops, to feed out before the fields are so far denuded as to be liable to injury from drouth.

Mowing Leids.—Clover which is clean enough for seed should be cut early, when first coming into bloom. Top-dress with fine manure, ashes and plaster, or guano and plaster, and a good crop of seed will be as sure as a crop of corn. Cut mixed grasses for hay, beginning when clover is in full bloom, before the heads brown, and cutting those fields first which have the most clover. Cure as much as possible in the shade—that is, in the cock, after thoroughly wilting in the sun. If the *Ox-eye Daisy* abounds in the grass, it is most important to cut it for hay before the stalks harden, and for the future welfare of the farm it is more important to cut it before the seeds are so nearly mature that they will ripen in the curing of the hay.

Root Crops.—Carrots and Rutabagas may be sown to as good advantage between the 1st and 20th of June, as earlier, considering the pressure of other work and the slight difference a few weeks make to these crops. Sugar Beets and Parsnips will make a fair crop, also, if put in as late as the first, but sowing should not be delayed after that time.

Field Beans.—This crop is generally planted before the 20th, if possible. Use only fresh, tender seed. Two-year-old seed will surely disappoint. See article in this and the previous number.

Cabbages can hardly be overrated as an economical article of cattle food. The only objection to raising cabbages as a dependence for green fodder in winter is, that their market price is usually so great we cannot afford to feed them out; but the same objection holds with regard to many other articles of human food. Set out the Flat Dutch, Drumhead, Mason, or other large varieties, after the middle of the month, in good soil, well manured with fine compost and top-dressed with lime.

Hoeing Corn and Potatoes.—All tillage of these crops goes by the name of hoeing, though done

with harrows, cultivators, or plows. The two-horse cultivators are fast taking the place of horse-hoes of the old patterns, and greatly simplify the operation of hoeing corn, by leaving so little for the hand hoes to do. The barrow should be used upon potatoes until they are fairly up, and the field is green. After this, light plows and cultivators do the work. There is no crop which requires more thorough weeding than potatoes, and none more generally neglected and more damaged by them.

Work in the Horticultural Departments.

It usually makes but little difference how unfavorable the spring months have been, the middle of June generally brings matters in the different departments to about the same point. The skillful gardener will have replanted where the cold rains have brought failures, and made up by extra care the delays caused by untoward weather.

Orchard and Nursery.

Shoots will push on old and young trees just where limbs are not wanted. Remember that the new tender shoot will soon be a hard, woody branch. A slight rub will now remove it, but if left a year, the knife must be used. Rub off these shoots when young and save cutting hereafter.

Pruning may be done this month, especially if large limbs are to be removed. Cut the limb close to the one from which it starts, and do not leave any stumps. Pare the wounds smooth, and brush them over with melted grafting wax.

Grafts will need looking to, and if two were inserted where one would be better, remove one of them. If some of the shoots on a graft are getting the advantage of the others, pinch them back.

Budded Stocks will often push such vigorous shoots as to need staking until they become strong.

Cultivation in the orchard has a twofold effect—it destroys the weeds, and leaves the surface in that light, mellow condition which enables it to answer the purposes of a mulch. Young orchards, with crops between the rows, should be cultivated with as much an eye to the trees as to the crops.

Mulching around newly planted trees should be put on before dry weather comes on. It is especially beneficial to cherries and other stone fruits.

Seed-Beds will need shading, as noted last month. Young evergreens will often rot or "damp off," without any manifest cause. Sprinkling fine sand or dry earth over the bed will often check it.

Nursery Stocks, intended for budding, should be kept in growing condition by good cultivation.

Thin the Fruit.—It is not often that this is done as thoroughly as it should be, and it is seldom that a tree bears a decent crop which would not have been better had half of the young fruit been removed.

Insects will demand attention this month. See notes given in May. One great trouble with insects is that they are left too long without molestation, and most people do not notice their ravages until the mischief is done. Whoever loves trees will be frequently among them, and observe the condition of each. A colony of caterpillars may often be disposed of in a few minutes, which, if left for a week, would prove a troublesome enemy.

Borers mostly lay their eggs this month; these are usually deposited on the bark of the tree near the ground, and the young grubs when hatched eat their way into the tree. Be sure that there are no grubs already in the tree, and some of the many preventives may be used. One of the most efficient of these is to wrap the trunk at the base with stiff paper, drawing away the earth around the tree, and replacing it to cover the lower edge of the paper. We have already given other expedients.

Curculio is only effectually managed by jarring the trees and catching the insects. On large trees a limb may be sawn off, to leave a stub which may be struck with a wooden mallet, but small trees can be easily shaken by a sudden jar with the hand.

The Stag which appears on the leaves of pear

and cherry trees is killed by dusting with air-slaked lime; it is said on good authority that dry dust of any kind will answer the same purpose.

Plant-Lice, often troublesome on trees, are killed by the use of an infusion of tobacco or of quassia.

Fruit Garden.

The *Insects* mentioned above, and others, will need close attention here; they are more easily managed in the fruit garden, as the trees are, or should be, dwarfs. Much can be done by hand-picking, which is, indeed, the only way of managing some of the larger ones that infest the grape.

Currants will need care to protect them from the currant worm. See article on page 185, last month. Many useless shoots will appear upon the bushes, which may be rubbed out. Green currants often bring a higher price than ripe ones, and where this is the case it is better to dispose of a portion of the crop in the green state.

Strawberries will now demand attention. The rows should be mulehed, if not already done. Straw or coarse hay is best. Saw-dust and tan-bark soil the fruit. Keep the runners cut where close culture is practised, and pull up large weeds. Some hints on picking are given on page 224.

Blackberry Bushes should have the new growth pinched at the height of 4 or 5 feet, to make them throw out side branches for next year's fruiting.

Grape Vines.—The management of young vines has been sufficiently treated of in articles upon the grape in the preceding numbers. The future success of the vine depends upon getting a good strong cane to start with, and already sufficient directions have been given for securing this. Superfluous buds will appear, which should be rubbed off. Young vines will be apt to be injured from over-bearing, and one or two bunches are enough to a cane. If mildew appears, use sulphur. Keep the young growth carefully tied up to the trellis.

Kitchen Garden.

Do not let disappointment from rotting of seeds, killing by late frosts, or bad luck of any kind, prevent from trying again. Those who have been deterred, by a press of work, from giving proper attention to the garden, can do considerable even now. It is true, the products will not be early, but they will be better than none. Seeds sown in the warm soil come on rapidly, and with a little exertion Tomato, Cabbage, Pepper, and other plants, can be had, and a pretty fair family garden yet be enjoyed.

Asparagus.—The rule is to stop cutting when peas become plenty. If the bed has become weedy, hoe it over carefully, give a dressing of manure or compost, and let the plants grow.

Beans.—Plant succession crops of bush beans. It is early enough in most places for Limas, on the cultivation of which see note on page 225.

Beets and Carrots.—Thin and weed. See article on the subject last month, on page 188. The thinnings of beets are excellent to use as "greens."

Cabbages.—The early sorts, in the best-managed gardens are ready for use or sale this month, but in most family gardens there are no facilities for early plants, and those from an open air seed-bed are now transplanted. Keep the ground loose among young plants by the use of the rake. If the plants are troubled by cut-worms, look for their holes (usually covered by a leaf) and dig them out.

Celery.—The seedlings should be thinned and weeded. Henderson, in his article on celery, recommends shearing off the tops of the young plants, to make them grow stocky. The main crop is best set in July, but early plants may be set in well-manured trenches as soon as large enough.

Corn.—Sow at intervals of two weeks, and have a good supply for drying for winter use.

Capsicums or Peppers.—Put out in a well-manured bed in a warm place, and give good cultivation. Set in rows 2 feet apart and 15 inches between.

Cucumbers.—Set out the plants started under glass, and sow seeds in the open ground in well-

manured hills, which should be about four feet apart. Keep off the striped bug by some of the means mentioned in the article on page 222.

Egg Plants.—These are warm weather fellows, and do but little until the soil has become well heated. Give a rich spot, hoe often, and each plant may yield six or eight large fruits, or only one.

Endive.—Sow for a late supply, and transplant, when large enough, to a foot apart each way.

Lettuce.—The India is the best sort for summer use.

Melons are to be treated as directed for cucumbers.

Onions.—Keep clear of weeds, and thin. It pays to sell onions long before they are ripe.

Parsnips.—Thin and hoe, and keep the bed clear of weeds until the leaves meet between the rows.

Peas in field culture simply have the earth drawn towards the vines to form a ridge. Put brush early to the tall-growing sorts, and plant succession crops.

Radishes, if relished so late in the season, may be sown at intervals of a week in unoccupied spots.

Rhubarb should not be pulled so freely when fruits come; let the plants recover. Cut the flower stalks as soon as they appear.

Ruta-Bagas, if sown in the garden, may be put in at the end of the month. Dust with plaster and ashes or lime as soon as the plants are up.

Salsify, a most excellent vegetable and often called "Oyster Plant," is grown in the same way as carrots. It is not too late to sow seed this month.

Spinach.—A succession crop may now be sown.

Squashes.—Treat the bush sorts as directed for cucumbers. Winter varieties must have room to run; give them plenty of manure; put in hills, 8 feet apart each way; keep off striped bugs as directed on page 223; hand-pick squash-bugs; keep the ground clean until the plants take possession of the soil, after which do not disturb them.

Sweet Potatoes.—At the North it is not too late to plant in well-manured ridges, as directed last month.

Tomatoes.—Set out, if not already done. In field culture the plants get no support, but in gardens it conduces to neatness and fruitfulness to have some kind of trellis. One cheap form for individual plants was given in last month's "Basket."

Weeds will need constant attention; they are easily managed when young, and are very stubborn when large. The free use of the rake or the pronged hoe will keep the garden in order, with much less trouble than a periodical spell of hoeing.

Flower Garden and Lawn.

The tender annuals sown the first of June will do quite as well, or better, than if put in the ground earlier. So with the majority of bedding plants, which are often seriously checked in their growth by chilly nights, and are a long while in recovering.

Green-House and other plants in pots are often used with good effect in decorating the grounds. They may be turned out of their pots into the border, or the pots may be plunged up to their rims. In the latter case, put some coal ashes under the pot, to prevent worms from finding their way in.

Oleanders, Oranges, Grape Myrtles, and such shrubs, may be turned out with benefit, provided they are taken up and potted early enough in the fall.

Fuchsias make good border plants if they have been grown sufficiently tall, and are placed where they will have shade in the hotter portions of the day.

Bulbs.—To have the best flowers of Hyacinths and Tulips, the bulbs should be taken up when the foliage begins to wither, dried, and kept until time to plant in fall; but in most gardens where special care is not given they are left out for several years, the bloom decreasing in size and beauty each year.

Annals.—Transplant or thin out the seedlings. Many kinds will do well if planted now. We gave a list of good sorts on page 187, last month.

Roses of the perpetual sorts should have the faded flowers removed, and their small branches shortened, to induce a new crop of flowers. Slugs must be treated to whale-oil or creosote soap. Train up some strong shoots of the climbing varieties to re-

Two Halves equal One Whole One.

But aside from the good done to others by introducing a journal of this character, the premiums appeal to one's own direct, immediate, personal interest. The premium articles are all very good and valuable, and a few hours of canvassing will secure one of them without cost. Try it with a will and determination to succeed, and in nine cases out of ten you will be successful. Take a copy of the paper,

Every article on our list is the best of its kind, and, in all respects, what is claimed for it.  **No charge is made for packing or boxing any article** in our Premium List. The forty-four Premiums, viz., Nos. 1, 2, 6, and from 36 to 39, and from 50 to 56 inclusive, will each be delivered **FREE** of all charges by mail or express, (at the Post-Office or express office nearest

[illegible]

AMERICAN AGRICULTURIST.

ORANGE JUDG & Co., Publishers, 245 Broadway, N. Y. City.

ANNUAL SUBSCRIPTION TERMS (always in advance): \$1.50 each for less than four copies: Four to nine copies, \$1.25 each: Ten to nineteen copies, \$1.20 each: Twenty copies and upwards, \$1 each. Papers are addressed to each name.

DID YOU SEE IT?

Did you see the offer made by us last month, to send without charge (and post-paid at that) one of our beautiful and valuable *Annals*, for every subscriber to the *Agriculturist* you would send us during May? (We now renew and continue the offer for the month of June.) Those *Annals* are not only very beautiful books, but they are very valuable—they are full of good information, are splendidly illustrated, and ought to be in every family in country, city, or village. They contain many dollars' worth of information, and were prepared at large expense, yet they are sold for only 50 cents each, (postage included.) They are:

- No. 1 *Agricultural Annual*, for 1867.
- No. 2 *Agricultural Annual*, for 1868.
- No. 1 *Horticultural Annual*, for 1867.
- No. 2 *Horticultural Annual*, for 1868.

These are universally admitted to be the cheapest volumes issued. They are original, the matter and engravings being all prepared exclusively for these volumes by a large number of first class, practical writers. As these books are a permanent Annual Institution, we want everybody to have a copy, for all who get them this year will be sure to want the numbers for 1869 and thereafter. We therefore invite everybody who has not done so already, to send only 50 cents, and secure a post-paid copy of either the *Agricultural Annual* No. 2, or the *Horticultural Annual* No. 2, or send \$1 and get both of these volumes, or \$2.00 for the four.

To any one sending during the month of June a subscriber to the *American Agriculturist* for 1868 at the regular price (\$1.50), we will present a copy of either of the above-named *Annals* that may be desired, and we will send it post-paid to any point in the United States or Territories, (except to those places reached only by the Overland Mail, as that mail will not carry books unless prepaid letter postage)...A few minutes' work or talking will enable any person to secure a subscriber to the *Agriculturist* (as valuable as we are now making the paper), and then the *Annual* will be obtained free.

N. B.—One *Annual* is offered for each subscriber sent at \$1.50. The sender can choose any one of the four *Annals*. One, two, three, four, or more subscribers will secure an equal number of *Annals*, of any issue desired...N. B.—These premium *Annals* are special, and are not included in the general premiums which are separate, but are continued—for this month only.

containing a great variety of items, including many good hints and suggestions which are thrown into smaller type and condensed form, for want of space elsewhere.

How to Remit:—Checks on New-York Banks or Bankers are best for large sums; made payable to the order of Orange Judd & Co.

Post-Office Money Orders may be obtained at nearly every county seat, in all the cities, and in many of the large towns. We consider them perfectly safe, and the best means of remitting fifty dollars or less, as thousands have been sent to us without any loss.

Registered Letters, under the new system, which went into effect June 1st, are a very safe means of sending small sums of money where P. O. Money Orders cannot be easily obtained. Observe, the *Registry Fee*, as well as postage, must be paid in stamps at the office where the letter is mailed, or it will be liable to be sent to the Dead Letter Office. Buy and affix the stamps both for postage and registry, put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Letters sent in this way to us are at our risk.

Postage.—To our published terms for the *American Agriculturist*, postage must in all cases be added when ordered to go out of the United States. For Canada, send twelve cents besides the subscription money with each subscriber. Everywhere in the United States, three cents, each quarter, or twelve cents, yearly, must be pre-paid at the Post-office where the paper is received.

Plow Trial of the N. E. Ag'l Society.—An important trial of plows was conducted at Amherst, on the grounds of the Agricultural College during four days last month, by the New England Agricultural Society. There were but few entries, considering the importance of the trial. However, several of the most popular plows of the East were tried and passed upon. The judges gratified the public by reporting the awards at once. It is hardly fair for us to give them without the accompanying remarks of the committee, but want of space prevents our giving them in full. In Class I—Sift Soil Plow—there were 7 entries, and while the Ames Plow Co. and the Collins Plow were highly commended, the Morse Iron-beam Plow took the medal and C. W. Sykes' Victory 1 the diploma. In Class II—Sift Soil Stable Plow—there were 5 entries. Collins' Co.'s C. 3, took the medal, Belcher & Taylor's No. 5½ the diploma, and Ames' Co.'s 5½, a diploma. In Class III—Light Soil Soil Plow—medal to Ames' Co.'s Telegraph 3; diploma to Collins' Co.'s E. 12; and a diploma to Meade's Conical. In Class IV—Deep Tillers—5 entries, Ames' Co.'s 77, medal; Collins' Deep Tiller, diploma. Class V—1 entry—medal to the Ames' Co.'s Double Plow. In Class VII—3 entries—Ames' Plow Co.'s 8½ Improved took the medal, and Collins' Co.'s B. 12, received the diploma. In Class VIII—3 entries—the Ames' Co.'s Steel, Side-hill Single Swivel Plow, A. 2, received the medal, C. W. Sykes' Victory Plow, the diploma.

The Death of Dr. Dana.—Dr. Samuel L. Dana died at Lowell, Mass., in March last, at the age of 73. Doctor D. was a practical chemist, but long an honored friend of agriculture, and is best known to agriculturists by his *Muck Manual* and *Essay on Manures*.

An Omission.—It should have been stated under the spirited engraving on page 230, that it was drawn and engraved from a painting by Henriette Bonner.

A Large Price for Plants.—At a recent sale in London, twelve new seedling Coleuses, plants so much admired for their ornamental foliage, brought the sum of £393, 3s. or over \$1,700 in gold. They were taken up by the London florists, and as they propagate rapidly, we shall soon see them over here.

Bees in June.—By Wm. W. Cary. The profits of the Apiary depend much upon management this month. Put on surplus boxes early. Stick guide comb in them; this will induce the bees to begin work sooner. If but two sides are of glass, put the guides parallel with the glass—it looks better when finished. An inviting appearance in any market article which may be classed among luxuries greatly helps the sale. All swarms are aided by feeding them, for a few days after hiving, especially if the weather proves unfavorable. By a little well-timed attention, either by feeding, supplying with empty worker comb, or giving maturing brood, according to circumstances, swarms may be equalized so

that the autumn will find them almost on a par for passing the winter; and this may be done in much less time than the novice would suppose. The frame honey-box, or "super," is growing in favor with those who use movable comb hives. The frames should be ½ or ¼ the size of the hive frames so that they may be conveniently used in case of necessity for winter or spring feeding. All partially filled frames, should be kept for next season's use, and given to the strongest stocks—they will be filled and sealed over before the bees, under other circumstances, would have got fairly at work in the boxes. Such frames should be put farther apart than those in the body of the hive, as store combs are built thicker than brood combs, and each frame should have a guide comb for starting. These frame boxes have no bottoms, but movable tops.

Humbugs, 2d Edition.—After the following page was "made up," we learn that A. A. Kelly has gone to Buffalo. Some people at Buffalo having been swindled by Clark, Webster & Co., sent on a defective here to look into the matter. The result was, the head of the concern was indicted by the Grand Jury of Erie Co., arrested in New York, and taken to Buffalo to answer. The head of Clark, Webster & Co., turned out to be no other than A. A. Kelly, of Kelly's Weekly.

Beautiful Pictures.—We have frequently said that the illustrations alone in the *American Agriculturist* are worth far more than the price of the paper. This is literally so, because they are truthful representations of real subjects in a high style of art, and are both pleasing and instructive. People generally ought to be more cheerful and happy than they are, and pictures help to make them so. Have pictures in your homes—the best that can be afforded—and enjoy them. Our attention was called to this subject by some beautiful chromos from L. Prang & Co., Boston. We wish every house in the land could have some of these beautiful gems of art in it.

N. J. State Agricultural Society.—We go to press too early to report the Sales Fair held on the 30th to 23d of May. There will be a Strawberry and Floral Exhibition some time during the present month, to be announced; a trial of Mowers and Reapers in July, and the regular Annual Fair in September. The exhibition grounds and buildings of the society are midway between the cities of Newark and Elizabeth, and are very convenient and beautiful.

Sundry Humbugs.—S. G. Sheaffer & Co., Hanover, Pa., do not like our notice of their proceedings, and are foolish enough to tell people on their envelopes that we have "seen proper to denounce" them. We class them as humbugs, because they have what is to all intents and purposes a lottery, or game of chance. They say in their circular as follows: "We take a thousand and one hundred and seventy dollars, which we put into one thousand envelopes; the money is divided into 230 parts: The largest single amount in one envelope, \$75.00; 2 envelopes of \$5; 10 of \$2.50; 30 of 50 cts.; 40 of 25 cts.; and 200 of 10 cts. Every thousand must be sold before a fresh one is touched, and persons are certain of getting just so much money in every thousand, and as likely to get the best package last as first." Here is proof that would hold in any decent court, that these people are disposing of money by "lot," and we place their project in the same list with other "gift distributions"...Will everybody please stop sending us Hallett, Moore & Co.'s lottery tickets. "Sandy River Petroleum Stock" won't pay the postage. The "Geo. Washington Toilet Watch Manufacturing Co." are not to be found at the number given, and we hope nobody will be foolish enough to invest money in such stock. The scheme proposes 200,000 shares of stock at \$2.50 each; these are offered for sale, and when the stock is all sold they will send to the holder of each share a "gold watch," and give him the chance of drawing \$30,000 in greenbacks. These fellows have the impudence to say, "This is no lottery!" We speak of this more in detail to show one prominent point in all "lottery" schemes. They induce people to send \$1, \$2 or \$3, as the case may be, as an investment, for which they are sure to get the value, and more, in "Gold Jewelry," and besides this have a chance of getting still more in money or valuable goods when the "drawing comes off." The "gifted trash," for it is not gold, may possibly in half the instances be obtained, but the "drawing" on which so many hopes are placed never comes. After a few weeks of waiting, the expected victim writes us to know if we can help him out. If any of these persons had considered more carefully the papers sent, their own judgment or that of their neighbors would have shown that it was impossible for the senders of the circulars to do as they propose; the whole thing bears the stamp of a "swindle," on its very face. Beware of all lottery Mining schemes. The Mount Vesta Gold & Silver Mining Co., J. P. M. Kennedy, President, is not to be found at the number given...AF-

ter many trials we have succeeded at last in finding the Excelsior Sewing Machine; it is not a machine that we would buy at any price. Steer clear of R. H. Homan & Co., Astoria, N. Y., and his Jewelry orders.... A. A. Kelly & Co.'s matters have assumed a new phase. Kelly & Co. have long imposed upon the public by scattering prize tickets broadcast with their Journal, a paper issued in imitation of Harper's Weekly. These tickets, each and all, appear to draw "prizes" of \$100 to \$200, but 5 per cent cash advance is required to secure the prizes. When this payment is made, the victim gets a certificate of \$100 or \$200 shares in an oil company. We estimate the value of these certificates of shares at about one-twentieth part of a cent—a waste paper! Now we have circulars from Damon, Lee & Co., who claim to have got hold of \$163,000 worth of the genuine prizes of Kelly & Co., such as diamonds, pianos, etc., of which they propose to make a "distribution" to ticket-holders. On the other hand, Kelly & Co. assert that some one has fraudulently obtained the names of some of their ticket-holders, and caution people to send no money to any except themselves. Damon, Lee & Co. say that Kelly & Co. send out nearly all "stock," and that they have got the valuable presents. There is a large cat in that meat tub. There may be one actor under two names, or there really may be two concerns; if the latter, honest people will not get their dues, even if "rogues fall out." None but very foolish people will have anything to do with such concerns as Damon, Lee & Co., or Kelly & Co.

Send Your Name.—The English journals have over their "answers to correspondents," the standing notice that anonymous communications will be disregarded. We do not wish to make this rule, as it is often the case that a very excellent suggestion comes to us from those who have a dislike to appear in print. Please understand that we never print a name when there is any indication that the writer would prefer to have it withheld. Put the initials at the end of a communication, or any assumed name, but below give us the real address. We ask this for the reason that it often occurs that we wish to correspond with the writer. At other times it happens that the question is not of general interest, and we would rather reply by letter than in the paper. A case has recently happened in which it would have been of considerable benefit to the correspondent if we had known his full address.

Answering Letters.—When one writes us for information upon some subject properly within our province, it is a pleasure to answer, if we can find time. While we do not acknowledge ourselves under an obligation to answer—as some seem to assume—we take the same pleasure in helping another engaged in the same pursuits that any obliging person always feels. Now, a word with our correspondents. We have an information to sell; so do not enclose any sum for "our trouble." It only puts us to the "trouble" of returning the money. Put in the exact postage and no more. When we write letters for fees we will publish a tariff of charges. Do not ask us where to get seeds, plants, or machines, unless it is some unusual or out-of-the-way thing. All the large dealers keep everything in their line, or will get it. Do not ask our opinion about advertising Doctors. We have but one answer concerning the whole crew—"We do not know anything of them." The place to look for information about these fellows is in our Humbug article. We repeat with emphasis, that any one calling himself a "doctor," who warrants a cure, who advertises a medicine, or who publishes certificates, is a quack, and is to be avoided. Don't ask us if such and such are not exceptions, they are all in the same boat. In writing, please ask the question directly, without obliging us to read half a page of apology—and do use black ink. Many letters that would have been answered have been delayed by the absence of the editor in whose department they come. This must be taken as an apology to those who feel that they have been neglected.

Southern Journals.—It is very pleasing to notice that in almost every Southern State some enterprising man starts an agricultural journal. Of some of these papers we have spoken in terms of commendation. Other Southern agricultural papers have come to us lately, and, without giving at present their titles, we have a word to say to the editors of some of these sheets, as most of them seem to be new in journalizing, and we hope that they will take it kindly if we give them a bit of advice. It is not proper for a journal which professes to be agricultural to discuss political topics. Other papers can present and discuss all subjects that have a political aspect. The text of an agricultural paper should be, "The soil, and what we can get from it." Then, again, some of our new exchanges, while they have very good editorials, use many excellent selections. This is a very good thing to do, and we would mildly suggest to at least two of the new papers, that courtesy, not to say justice, would

demand that they place "American Agriculturist," after a good share of their articles. We wish others of our friends, both North and South, who find our articles of sufficient importance to quote, would take notice that the title of this paper is not "Ex," nor yet is it "Exchange," but that it is the *American Agriculturist*. Please notice that each issue of our paper is copyrighted, but not to prevent free quotation by any one who may see fit to use our articles. We allude to this in no threatening spirit, but would simply warn certain parties, whom, considering their inexperience, we do not choose to call by name, that, while we are quite willing that our articles should be used with proper credit, a continued appropriation of our matter without any acknowledgment of its source, will compel us, however reluctantly, to avail ourselves of the provisions of the copyright law.

The R. I. Schoolmaster.—Many of the readers of the *Agriculturist* are school teachers—at least during a portion of the year—and to such of these as wish to be advised in regard to educational matters, we can commend the Rhode Island Schoolmaster, published at Providence. Its principal editor is Doct. J. B. Chapin, who is School Commissioner for the State, and has the additional claim of being a zealous horticulturist.

Ornamental Planting.—Our climate is not as well suited to "foliage plants," as that of Europe, and those who follow the directions of foreign writers are likely to fail. Our hot sun is death to certain plants that are the pride of the English gardener, and our attempts at bedding effects, when founded upon European practice, are failures. But few of the variegated Pelargoniums (Geraniums) with which the English do so much, will stand our suns; and so with other plants. Still, we can do something. The Cannas, Coleus, in its varieties, the newer sorts of Ricinus, and other things, fairly revel in our hot weather, and we can, by choosing tropical or sub-tropical plants, produce a fine effect. Last summer we made a most effective bed upon the lawn—that was the admiration of all who saw it. The bed was an oval, about 15 feet in its longest diameter. The outer edge was the silver gray of *Chenardia maritima*, or "Dusty Miller." Within this was a row of Coleus, then a row of the Mexican Sage, (*Salvia splendens*), green in summer, but gorgeous with its scarlet blooms in autumn, and in the center was a group of Cannas. Now, we do not wish to put this arrangement forth as a model to be followed; but to suggest some plants which, even if put out as late as June, will produce a satisfactory effect. Along the Atlantic Coast we generally have a cold storm soon after the first days of June, and our experience has been that bedding plants set out early, if they manage to live through the adverse weather, are not, in the long run, as satisfactory as those put out after warm weather has fairly set in.

Darwin's Variations of Animals and Plants is the book of the season. It has received the commendations of the papers whose literary criticisms have the most weight. While we do not at present commit ourselves to all of Mr. Darwin's views, we commend this work as a most remarkable collection of interesting facts. No one who has controverted Mr. Darwin's deductions has denied his accuracy and honesty in presenting facts. To the thoughtful reader this work presents an inexhaustible fund of material, as it not only shows what has been done in improving our animals and plants, but suggests many things for experiment.

Parsnips.—"D. L. M., Dutchess Co., says a Jerseyman advises him not to feed parsnips to milch cows, "on account of their weakening qualities." We have never discovered any bad effects from feeding parsnip. The root is as wholesome as the sugar beet, and the great reason that they are not more fed to cattle is that they are worth too much in the market for human food. They are rarely below \$1.50 a barrel in the New York market, and sometimes bring \$6.00. They are a paying crop at fifty cents a bushel, and at that price they can hardly be afforded for cattle when other roots can be raised for half that sum. Raise the parsnips by all means, but do not feed them out when you can get a dollar a bushel for them, or more, at the nearest market. They want a deep, sandy loam, moderately rich. In garden culture they are sown below 15 inches apart, and in field culture about 30, to admit of cultivation by horse-power. They should be thinned out to 4 inches apart, and be kept scrupulously clean through the season. In good, rich soil, the yield will be from five to eight hundred bushels per acre. They are not injured by the coldest weather, and if the ground be kept covered with a heavy mulch of salt hay, or straw, they can be dug at any season, and be marketed to the best advantage.

Mr. Knox's Strawberry Exhibition.—Mr. Knox is great on raising strawberries and

is not afraid to show how he does it, so he each year holds an exhibition, at which the fruit can be seen on the table, or on the vines. As Mr. K. sends fruit to the New York market all the way from Pittsburgh, he wishes the best package for shipping. Premiums to the amount of \$300 are to be awarded "for the best contrivance for carrying grapes and berries to distant markets." Particulars forwarded on application. We do not know what the requirements are, but suppose that the baskets must be big enough to hold "700" berries. The show will be held on the 17th of June at Pittsburgh.

Hoopes' Evergreens.—This work is being rapidly taken up by nurserymen and cultivators, and we hope that they will adopt its nomenclature, as it will be a great relief to purchasers. To the planter this work is particularly valuable, as it gives, without prejudice, the experience of the author with all the new evergreens.—There is no work extant that contains so full an account of these trees as this does, and we feel a pleasure in presenting so much useful information, in so handsome a style, at the low price of \$3, by mail.

Report of the American Dairy-men's Ass'n.—We have received from the Secretary, Mr. G. B. Weeks, of Verona, N. Y., the third Annual Report of the Am. Dairy-men's Society. This institution has been of very great benefit to the dairy interests of our country, especially to the cheese makers, and the annual reports form a course of very instructive reading for any one interested in the increased development of our agricultural resources, and are almost indispensable to practical cheese manufacturers.

Trouble with Cabbages.—J. H. Evans, Ark., has specks appear upon the outside leaves of his cabbages, and the affection proceeds to the center. He does not state whether this happens to the growing cabbage, or after it is stored. We have seen cabbages similarly troubled that had been stored in too damp a cellar, but nothing like it in the growing crop.

Hot-House Grapes.—S. D. Ingraham, Brown Co., wishes to know if hot-house grapes can be made profitable. That depends upon the market; near our large cities, where there are plenty of wealthy people, who will pay \$2 to \$5 a pound, some of our skillful growers make it pay, but it would not be a very profitable business away from such points, and nowhere in unskilful hands.

Pear Tree not Blooming.—R. Middleton, West Philadelphia, has a Vicar pear tree, supposed to be a dwarf, which does not bloom, though about nine years old. If it was a dwarf, it was probably set so deep that a portion of the pear wood was buried, and it has thrown out roots and become a standard, and does not bear because it has not yet attained its growth. Probably root-pruning would throw the tree into bearing.

Papering on Outside Brick Walls.—"Dr. E. B., Washington Co., Ill. We infer from your letter that you have already plastered directly upon the brick walls of your house. This is wrong practice. You should have "furred out," as the builders say—that is, put up strips against the bricks, and lathed and plastered upon them—thus leaving a space of free air between the wall and the plastering. The rooms would then always be dry, and warmer than otherwise. If you have plastered upon the bricks, you will be troubled in cold weather, by moisture depositing on the inner side of the wall; and in case storms beat against the wall it may wet through. You can dry the walls rapidly by making fires, and when dry they may be painted with good boiled linseed oil paint. This will prevent water from the outside coming through, but it will not help the deposition of water on the inner side much, if at all, and it is this chiefly which prevents the paper from holding.

Agricultural Editors of Daily Papers.—It has of late become the fashion for daily papers to have agricultural columns, and for these they have "Agricultural Editors." These are a variable lot; some of them hold their places for the sake of the perquisites, and kick out their scanty pay by announcing themselves as purchasing agents. Others are well meaning men, who can write as well on one subject as another, and then again we find one who knows just what he is talking about. In the last named class we place Mr. A. S. Fuller, who does the agricultural and horticultural matter for the N. Y. Sun. Mr. F. is no man worshipper, but has a great reverence for the truth. What seems to him right, he announces fearlessly. Of course, whatever Mr. F. does is well done. We can say that Mr. Fuller's Department is as good as the others in that excellently managed paper, and add that the other departments are as good as Mr. Fuller's. If our readers infer that we consider the Sun able altogether, they will not be far wrong.

Poudreite.—J. Markham, Mo. The name "poudreite" is applied to night soil, or the contents of privy vaults, when dried and rendered nearly odorless, and used as a manure. This may be accomplished by the mixture of fine peat or dust-dry muck with the material, either daily as it accumulates, or by emptying the vaults and conveying the semifluid mass to hard ground or board floors, where it may become partially dry, and when of the proper state of dryness, be mixed with fine dry muck or other similar material: good mellow soil will do, perhaps, equally well. This mixing must be very thorough, and the mass subsequently dried. There is very little danger in applying poudreite too liberally. As an article free from weed seeds, fine, and easily applied in drills and hills, to field crops and to garden vegetables, it is useful; but as a market fertilizer its value is almost invariably overestimated. In the sun-drying of night soil it is well worth while to sprinkle over it, whenever stirred, a good dusting of plaster, to arrest any evaporation of ammonia.

Apple Pomace.—"A Subscriber" has 25 or 30 loads of apple pomace, and wishes to use it as manure. We have no doubt of its value, if properly composted with lime or ashes. It would, in our opinion, be worth more than chip manure or swamp muck, but we have never tried it, though probably others have.

Clay a Substitute for Muck.—"I. K. C.," Dover, Del. Clay is probably quite as good an absorbent as muck or peat, and there is no objection to a free use of it in your compost heaps. It does not contain so many elements of nutrition as muck. If your lands are sandy, it might prove more valuable than muck in the compost heap. The clay will be better, if kept under cover and beaten up fine before it is used.

Surface Manuring.—"A. H. L.," of Stroudsburg, Pa. The tendency of the best practice among farmers now is to apply fertilizers on or near the surface. Top-dressing with compost always pays. Fresh stable manures are best applied on grass lands in the fall, and some think this the best time to manure for corn, to be planted the following spring. John Johnston says: "I have used manure only as a top-dressing for the last 26 years, and I do think one load used in that way is worth far more than two, plowed under on our stiff land."

Bone-Dust—How much to the Hill.—"A. K., Jr.," Rural Felicity, Md. Three hundred pounds to the acre is considered a good dressing on pastures or mowing lands. If the land is poor, more will be needed for a good crop of corn, say five hundred pounds to the acre. Divide this by the number of hills in an acre, and you will have the quantity by weight for each hill. Put this in a small cup, and you can determine with sufficient accuracy by the eye, how much to put in each hill, to distribute the whole quantity evenly over the acre. It is safely and economically applied to the growing crop. Better results would be realized the first season, if the bone-dust were mixed with some fertilizer, containing more ammonia, as Peruvian guano or fish guano.

Wood-mold for Corn.—"A Young Farmer," Deckertown, wishes to know if the mold taken from the forest would be of any benefit to corn. The surface mold from the forest, made from the decayed leaves of hard-wood trees, contains all the elements found in the corn crop, and would unquestionably benefit it. We could not tell whether the carting would pay, without knowing the distance. Lime or ashes mixed with the mold would be a valuable addition. Please report the result of the experiment, if account is kept of expenses. Remember that you benefit one crop at the expense of another, if you take the mold away from growing timber.

Plowing Barn-Yards.—"W. D.," Litchfield Co., Conn. This is of great advantage, if the yard is kept well stocked with muck or loam. The droppings of the cows is thus mixed intimately with the muck, and all loss is prevented. It is not quite so pleasant for the milkers to walk on the freshly turned muck, but it improves the quality of the compost usually made in the barn-yard. The muck and the plowing are both likely to be undervalued, at this busy season of the year.

Can a Man Afford to Borrow Capital to Drain his Farm?—"W. B.," Berkshire County, Mass. This is one of the best uses capital can be put to, on land that needs draining. And all land is of this character, where water stands within a foot of the surface during any part of the spring. Two crops are estimated by some, who have experience in this matter, to pay for the whole expense of the operation. The land is more than doubled in value. The English Govern-

ment now loans money to farmers who wish to drain, taking security on the consequently enhanced value of the crops. This is the best possible evidence of the safety of using capital for this improvement, for it is drawn from the experience of a whole people, for a great number of years. Any one undertaking this work should buy and study "Draining for Profit and Health."

Hop-Growers' Journal.—J. S. Randolph and others. The Hop-growers' Journal had a short existence and was discontinued several years ago.

The Texas Farmer.—A new paper with this title is issued at Henderson, Texas, by W. K. Marshall & J. M. Dodson. The editors apologize for the mechanical appearance of their first issue, but they have no need to do so for its contents. Besides a number of judicious selections, there are spirited editorials, the tone of which we cannot but commend. The editors appear to be sensible persons, who think that improving the present hour is of more importance than lamenting over the past. It is good for Texas—or, indeed, any State—when her editors will give such advice as follows, and will be better still when the young men heed it: "Young men, go to work! There is no time to idle now. You must carve out your own fortune. You have no inheritance on which to depend. You must reconstruct your own fortunes by industry, and perseverance, and toil. Labor is honorable, and the ignoble are those who will not work. Get on a home;—and more of like purport."

Price of Farm Lands in Mass.—We notice in an advertising sheet the following prices for farms, mostly in Worcester County, and near good markets. One of 146 acres for \$3,500; one of 115 acres, \$3,300; one of 75 acres for \$2,600; one of 50 for \$800; one of 140 for \$4,500; one of 100 acres for \$3,300; one of 140 acres for \$1,700; one of 115 acres for \$3,200. These farms generally have houses and barns in tolerably good condition, and are within easy distance of schools, churches, and rail-road depots; the buildings in some cases cost all that is asked for the farms. All the cheap lands are not in the South and West, according to this advertisement.

A Grade Alderney.—B. McFarland, Delaware County, has a cow of this stock, that produced in ten months 5464 pounds of butter. The average yield of milk was 13 quarts daily. She has given milk steadily for three years. Can any one give a better record?

Greasing Cart and Wagon Wheels.—Tallow is the best article we have ever tried for wooden axle-trees. The rule is a little and often. But little can remain if a large quantity is put on, and the most of it is wasted. Castor oil is an excellent lubricator for iron and steel axles, and a damaged article can frequently be had at the apothecary's, at small cost. A teaspoonful is enough for each wheel, and it is fully to use more.

Cheese Factories—English View.—John Bull objects to our American cheese factories, because they will deprive his wife and daughter of an honorable and healthful employment, and by relieving them from labor, lead to idleness and extravagance. Could they not possibly work in the cheese factory, or do any thing else but make cheese in the old way?

Fowls with Scabby Legs.—G. M. Burnett, of Ill., writes: "A sort of dry, scabby crust, fully one-fourth of an inch thick, covers the legs and toes of some of my chickens, making them stupid and lame." This is the disease known as "scabby leg." We know of no cure. Soaking with warm water, and gentle rubbing, will remove most of the incrustation. Be careful not to rub or pull off the scales so as to cause bleeding. It usually accompanies close confinement, and disappears if the birds have a free range and access to the soil.

The Prevention of Diseases in Animals.—The Committee on Agriculture of the Massachusetts Legislature recently invited Professor Gamgee to deliver an address in the Green Room of the State House, Boston, on the subject of the Diseases of Animals. The Professor alluded to the extensive prevalence of maladies which were destroying over a million dollars worth of stock per annum, and pointed out that contagious diseases, such as pleuro-pneumonia in cattle, hog cholera, and scab in sheep, often threatened and effected the farmer's ruin. He alluded to the Spanish Fever, which has created such fear, wherever the trade in Texas cattle is carried on, and indicated that the laws governing the distribution of disease were not unknown. This understanding enabled us with the greatest certainty to prevent disease. He stated that, contrary to universal

belief, the improvements in the herds of animals, providing good shelter, feeding well—in short, high farming—tended to the extermination of important maladies. If so much can be done for us by science, why do we not avail ourselves of it? The Commissioner of Agriculture, General Capron, and the chairman of the Agricultural Committee of the House of Representatives are so thoroughly alive to the vast importance of this question, that some action will soon be urged upon Congress. The farmers of the country should use their influence that the subject be not shelved. It is one of vital, personal interest to every farmer. A subject of greater importance and urgency cannot engage the attention of our law-givers. The appalling statistics which General Capron can present, will, we are confident, rouse the people to demand immediate action. We have not been trained to regard the Government as in any degree responsible for the existence or prevalence of disease among animals. Nevertheless, when the true relations of the government to the governed are clearly understood, this responsibility will be placed where it belongs, and our people are fast waking up to a realization of the fact that their government is responsible for the dissemination of information concerning diseases of animals, and for the use of its great powers in checking contagions and infections.

Hens Eating Feathers Again.—E. C. Newton has tried feeding meat as a cure, without success. We have tried it with success, as we supposed. J. H. Mabbett gave a few drops tincture of iron in the water, fed meat with other food, and removed the cock whose feathers were particularly attractive to the hens, turning him in with them only an hour both at evening and morning. Thus he apparently removed the disease (or diseased appetite) from one of his yards.
